γ. Another opposition is that within virtue itself. Because the universal law of right reason is alone to be taken as the standard of action, there is no longer any really absolutely fixed determination, for all duty is always, so to speak, a particular content, which can plainly be grasped in universal form, without this, however, in any way affecting the content. Because virtue is thus that which is conformable to the real essence or law of things, in a general sense the Stoics called virtue everything, in every department, which is in conformity with law in that department. Hence, Diogenes tells us (VII. 92), they also speak of logical and physical virtues, just as their morality represents individual duties (τὰ καθήκοντα) by passing in review the individual natural relationships in which man stands, and showing what in them is rational.[141] But this is only a kind of quibbling such as we have also seen in Cicero's case. Thus in as far as an ultimate deciding criterion of that which is good cannot be set up, the principle being destitute of determination, the ultimate decision rests with the subject, Just as before this it was the oracle that decided, at the commencement of this profounder inwardness the subject was given the power of deciding as to what is right. For since Socrates' time the determination of what was right by the standard

of customary morality had ceased in Athens to be ultimate; hence with the Stoics all external determination falls away, and the power of decision can only be placed in the subject as such, which in the last instance determines from itself as conscience. Although much that is elevated and edifying may find its support here, an actual determination is still wanting; hence there is according to the Stoics only one virtue,[142] and the wise man is the virtuous.

c. The Stoics have thus in the third place likewise been in the way of representing an ideal of the wise man which, however, is nothing more than the will of the subject which in itself only wills itself, remains at the thought of the good, because it is good, allows itself in its steadfastness to be moved by nothing different from itself, such as desires, pain, &c., desires its freedom alone, and is prepared to give up all else — which thus, if it experiences outward pain and misfortune, yet separates these from the inwardness of its consciousness. The question of why the expression of rel morality has with the Stoics the form of the ideal of the wise man finds its answer, however, in the fact that the mere conception of virtuous consciousness, of action with respect to an implicitly existent end, finds in individual consciousness alone the element of moral reality. For if the Stoics had gone beyond the mere conception of action for the implicitly existent end, and had reached to the knowledge of the content, they would not have required to express this as a subject. To them rational self-preservation is virtue. But if we ask what it is that is evolved by virtue, the answer is to the effect that it is just rational self-preservation; and thus they have not by this expression got beyond that formal circle. Moral reality is not expressed as that which is enduring, which is evolved and ever evolving itself. And moral reality is just this, to exist; for as nature is an enduring and existent system, the spiritual as such must be an objective world. To this reality the Stoics have, however, not reached. Or we may understand this

thus. Their moral reality is only the wise man, an ideal and not a reality — in fact the mere conception whose reality is not set forth.

This subjectivity is already contained in the fact that moral reality, expressed as virtue, thereby immediately presents the appearance of being present only as a quality of the individual. This virtue, as such, in as far as only the moral reality of the individual is indicated, cannot attain to happiness in and for itself, even though happiness, regarded in the light of realization, were only the realization of the individual. For this happiness would be just the enjoyment of the individual as the harmony of existence with him as individual; but with him as individual true happiness does not harmonize, but only with him as universal man. Man must likewise not in the least desire that it should harmonize with him as individual man, that is, he must be indifferent to the individuality of his existence, and to the harmony with the individual as much as to the want of harmony; he must be able to dispense with happiness just as, if he possesses it, he must be free from it; or it is only a harmony of him with himself as a universal. If merely the subjective conception of morality is therein contained, its true relationship is yet thereby expressed; for it is this freedom of consciousness which in its enjoyment rests in itself and is independent of objects, — what we expressed above (p. 264) as the special characteristic of the Stoic morality. Stoic self-consciousness has not here to deal with its individuality as such, but solely with the freedom in which it is conscious of itself only as the universal. Now could one call this happiness, in distinction to the other, true happiness, happiness would still, on the whole, remain a wrong expression. The satisfaction of rational consciousness in itself as an immediate universal, is a state of being which is simulated by the determination of happiness; for in happiness we have the moment of self-consciousness as an individuality. But this differentiated consciousness is not present in that self-satisfaction; for in that freedom the individual has

rather the sense of his universality only. Striving after happiness, after spiritual enjoyment, and talking of the excellence of the pleasures of science and art, is hence dull and insipid, for the matter with which we are occupied has no longer the form of enjoyment, or it does away with that conception. This sort of talk has indeed passed away and it no longer has any interest. The true point of view is to concern oneself with the matter itself and not with enjoyment, that is, not with the constant reflection on the relation to oneself as individual, but with the matter as a matter, and as implicitly universal. We must take care besides that things are tolerable to us as individuals, and the pleasanter the better. But no further notice or speech about this is requisite, nor are we to imagine that there is much that is rational and important within it. But the Stoic consciousness does not get beyond this individuality to the reality of the universal, and therefore it has only to express the form, the real as an individual, or the wise man.

The highest point reached by Aristotle, the thought of thought, is also present in Stoicism, but in such a way that it does not stand in its individual capacity as it appears to do in Aristotle, having what is different beside it, but as being quite alone. Thus in the Stoic consciousness there is just this freedom, this negative moment of abstraction from existence, an independence which is capable of giving up everything, but not as an empty passivity and self-abnegation, as though everything could be taken from it, but an independence which can resign it voluntarily, without thereby losing its reality; for its reality is really just the simple rationality, the pure thought of itself. Here pure consciousness thus attains to being its own object, and because reality is to it only this simple object, its object annuls in itself all modes of existence, and is nothing in and for itself, being therein only in the form of something abrogated.

All is merged into this: the simplicity of the Notion, or its pure negativity, is posited in relation to everything. But the real filling in, the

objective mode, is wanting, and in order to enter into this, Stoicism requires that the content should be given. Hence the Stoics depicted the ideal of the wise man in specially eloquent terms, telling how perfectly sufficient in himself and independent he is, for what the wise man does is right. The description of the ideal formed by the Stoics is hence a common subject of discussion and is even devoid of interest; or at least the negative element in it is alone noteworthy. “The wise man is free and likewise in chains, for he acts from himself, uncorrupted by fear or desire.” Everything which belongs to desire and fear he does not reckon to himself, he gives to such the position of being something foreign to him; for no particular existence is secure to him. “The wise man is alone king, for he alone is not bound to laws, and he is debtor to no one.” Thus we here see the autonomy and autocracy of the wise man, who, merely following reason, is absolved from all established laws which are recognized, and for which no rational ground can be given, or which appear to rest somewhat on a natural aversion or instinct. For even in relation to actual conduct no definite law has properly speaking reality for him, and least of all those which appear to belong to nature as such alone, *e.g.* the prohibition against entering into marriage relations which are considered incestuous, the prohibition of intercourse between man and man, for in reason the same thing is fitting as regards the one which is so as regards the others. Similarly the wise man may eat human flesh,[143] &c. But a universal reason is something quite indeterminate. Thus the Stoics have not passed beyond their abstract understanding in the transgression of these laws, and therefore they have allowed their king to do much that was immoral; for if incest, pederasty, the eating of human flesh, were at first forbidden as though through a natural instinct only, they likewise can by no means exist before the judgment-seat of reason. The Stoic wise man is thus also ‘enlightened,’ in the sense that where he did not know how to bring the natural instinct into the form of a rational reason, he

trampled upon nature. Thus that which is called natural law or natural instinct comes into opposition with what is set forth as immediately and universally rational. For example, those first actions seem to rest on natural feelings, and we must remember that feelings are certainly not the object of thought; as opposed to this, property is something thought, universal in itself, a recognition of my possession from all, and thus it indeed belongs to the region of the understanding. But should the wise man hence not be bound by the former because it is not something immediately thought, this is merely the fault of his want of comprehension. As we have, however, seen that in the sphere of theory the thought-out simplicity of the truth is capable of all content, so we find this also to be the case with the good, that which is practically thought-out, without therefore being any content in itself. To wish to justify such a content through a reason thus indicates a confusion between the perception of the individual and that of all reality, it means a superficiality of perception which does not acknowledge a certain thing because it is not known in this and that regard. But this is so for the reason that it only seeks out and knows the most immediate grounds and cannot know whether there are not other aspects and other grounds. Such grounds as these allow of reasons for and against everything being found — on the one hand a positive relation to something which, though in other cases necessary, as such can also be again sublated; and, on the other hand, a negative relation to something necessary, which can likewise again be held to be valid.

Because the Stoics indeed placed virtue in thought, but found no concrete principle of rational self-determination whereby determinateness and difference developed, they, in the first place, have carried on a reasoning by means of grounds to which they lead back virtue. They draw deductions from facts, connections, consequences, from a contradiction or opposition; and this Antoninus and Seneca do in an edifying way and with

great ingenuity. Reasons, however, prove to be a nose of wax; for there are good grounds for everything, such as “These instincts, implanted as they are by nature,” or “Short life,” &c. Which reasons should be esteemed as good thereby depends on the end and interest which form the pre-supposition giving them their power. Hence reasons are as a whole subjective. This method of reflecting on self and on what we should do, leads to the giving to our ends the breadth of reflection due to penetrative insight, the enlargement of the sphere of consciousness. It is thus I who bring forward these wise and good grounds. They do not constitute the thing, the objective itself, but the thing of my own will, of my desire, a bauble through which I set up before me the nobility of my mind; the opposite of this is self-oblivion in the thing. In Seneca himself there is more folly and bombast in the way of moral reflection than genuine truth; and thus there has been brought up against him both his riches, the splendour of his manner of life, his having allowed Nero to give him wealth untold, and also the fact that he had Nero as his pupil; for the latter delivered orations composed by Seneca.[144] This reasoning is often brilliant, as with Seneca: we find much that awakens and strengthens the mind, clever antitheses and rhetoric, but we likewise feel the coldness and tediousness of these moral discourses. We are stimulated but not often satisfied, and this may be deemed the character of sophistry: if acuteness in forming distinctions and sincere opinion must be there recognized, yet final conviction is ever lacking.

In the second place there is in the Stoic standpoint the higher, although negatively formal principle, that what is thought is alone as such the end and the good, and therefore that in this form of abstract thought alone, as in Kant’s principle of duty, there is contained that by which man must establish and secure his self-consciousness, so that he can esteem and follow nothing in himself in as far as it has any other content for itself. “The happy life,” says Seneca (De vita beata, 5), “is unalterably grounded on a

right and secure judgment.” The formal security of the mind which abstracts from everything, sets up for us no development of objective principles, but a subject which maintains itself in this constancy, and in an indifference not due to stupidity, but studied; and this is the infinitude of self-consciousness in itself.

Because the moral principle of the Stoics remains at this formalism, all that they treat of is comprised in this. For their thoughts are the constant leading back of consciousness to its unity with itself. The power of despising existence is great, the strength of this negative attitude sublime. The Stoic principle is a necessary moment in the Idea of absolute consciousness; it is also a necessary manifestation in time. For if, as in the Roman world, the life of the real mind is lost in the abstract universal; the consciousness, where real universality is destroyed, must go back into its individuality and maintain itself in its thoughts. Hence, when the political existence and moral actuality of Greece had perished, and when in later times the Roman Empire also became dissatisfied with the present, it withdrew into itself, and there sought the right and moral which had already disappeared from ordinary life. It is thus herein implied, not that the condition of the world is a rational and right one, but only that the subject as such should assert his freedom in himself. Everything that is outward, world, relationships, &c., are so disposed as to be capable of being abrogated; in it there is thus no demand for the real harmony of reason and existence; or that which we might term objective morality and rectitude is not found in it. Plato has set up the ideal of a Republic, *i.e.* of a rational condition of mankind in the state; for this esteem for right, morality and custom which is to him the principal matter, constitutes the side of reality in that which is rational; and it is only through a rational condition of the world such as this, that the harmony of the external with the internal is in this concrete sense present. In regard to morality and power of willing the

good, nothing more excellent can be read than what Marcus Aurelius has written in his Meditations on himself; he was Emperor of the whole of the then known civilized world, and likewise bore himself nobly and justly as a private individual. But the condition of the Roman Empire was not altered by this philosophic emperor, and his successor, who was of a different character, was restrained by nothing from inaugurating a condition of things as bad as his own wicked caprice might direct. It is something much higher when the inward principle of the mind, of the rational will, likewise realizes itself, so that there arises a rational constitution, a condition of things in accordance with culture and law. Through such objectivity of reason, the determinations which come together in the ideal of the wise man are first consolidated. There then is present a system of moral relationships which are duties; each determination is then in its place, the one subordinated to the other, and the higher is predominant. Hence it comes to pass that the conscience becomes bound (which is a higher point than the Stoic freedom), that the objective relationships which we call duties are consolidated after the manner of a just condition of things, as well as being held by mind to be fixed determinations. Because these duties do not merely appear to hold good in a general sense, but are also recognized in my conscience as having the character of the universal, the harmony of the rational will and reality is established. On the one hand, the objective system of freedom as necessity exists, and, on the other, the rational in me is real as conscience. The Stoic principle has not yet reached to this more concrete attitude, as being on the one hand abstract morality, and, on the other, the subject that has a conscience. The freedom of self-consciousness in itself is the principle, but it has not yet attained to its concrete form, and its relation to happiness exists only in its determination as indifferent and contingent, which relation must be given up. In the concrete principle of rationality the condition of the world, as of my conscience, is not, however, indifferent.

This is a general description of Stoic morality; the main point is to recognize its point of view and chief relationships. Because in the Roman world a perfectly consistent position, and one conformable to existing conditions, has attained to the consciousness of itself, the philosophy of the Stoics has more specially found its home in the Roman world. The noble Romans have hence only proved the negative, an indifference to life and to all that is external; they could be great only in a subjective or negative manner — in the manner of a private individual. The Roman jurists are also said to have been likewise Stoic philosophers, but, on the one hand, we find that our teachers of Roman law only speak ill of Philosophy, and, on the other, they are yet sufficiently inconsistent to state it to the credit of the Roman jurists that they were philosophers. So far as I understand law, I can find in it, among the Romans, nothing either of thought, Philosophy or the Notion. If we are to call the reasoning of the understanding logical thought, they may indeed be held to be philosophers, but this is also present in the reasoning of Master Hugo, who certainly does not claim to be a philosopher. The reasoning of the understanding and the philosophic Notion are two different things. We shall now proceed to what is in direct contrast to the Stoic philosophy, Epicureanism.

B. Epicurus.

THE EPICUREAN PHILOSOPHY, which forms the counterpart to Stoicism, was just as much elaborated as the Stoic, if, indeed, it were not more so. While the latter posited as truth existence for thought — the universal Notion — and held firmly to this principle, Epicurus, the founder of the other system, held a directly opposite view, regarding as the true essence not Being in general, but Being as sensation, that is, consciousness in the form of immediate particularity. As the Stoics did not seek the principle of the Cynics — that man must confine himself to the simplicity of nature — in man's requirements, but placed it in universal reason, so Epicurus elevated the principle that happiness should be our chief end into the region of thought, by seeking pleasure in a universal which is determined through thought. And though, in so doing, he may have given a higher scientific form to the doctrines of the Cyrenaics. it is yet self-evident that if existence for sensation is to be regarded as the truth, the necessity for the Notion is altogether abrogated, and in the absence of speculative interest things cease to form a united whole, all things being in point of fact lowered to the point of view of the ordinary human understanding. Notwithstanding this proviso, before we take this philosophy into consideration, we must carefully divest ourselves of all the ideas commonly prevalent regarding Epicureanism.

As regards the life of Epicurus, he was born in the Athenian village of Gargettus in Ol. 109, 3 (B.C. 342), and therefore before the death of Aristotle, which took place in Ol. 114, 3. His opponents, especially the Stoics, have raked up against him more accusations than I can tell of, and have invented the most trivial anecdotes respecting his doings. He had poor parents; his father, Neocles, was village schoolmaster, and Chærestrata, his

mother, was a sorceress: that is, she earned money, like the women of Thrace and Thessaly, by furnishing spells and incantations, as was quite common in those days. The father, taking Epicurus with him, migrated with an Athenian colony to Samos, but here also he was obliged to give instruction to children, because his plot of land was not sufficient for the maintenance of his family. At the age of about eighteen years, just about the time when Aristotle was living in Chalcis, Epicurus returned to Athens. He had already, in Samos, made the philosophy of Democritus a special subject of study, and now in Athens he devoted himself to it more than ever; in addition to this, he was on intimate terms with several of the philosophers then flourishing, such as Xenocrates, the Platonist, and Theophrastus, a follower of Aristotle. When Epicurus was twelve years old, he read with his teacher Hesiod’s account of Chaos, the source of all things; and this was perhaps not without influence on his philosophic views. Otherwise he professed to be self-taught, in the sense that he produced his philosophy entirely from himself; but we are not to suppose from this that he did not attend the lectures or study the writings of other philosophers. Neither is it to be understood that he was altogether original in his philosophy as far as content was concerned; for, as will be noted later, his physical philosophy especially is that of Leucippus and Democritus. It was at Mitylene in Lesbos that he first came forward as teacher of an original philosophic system, and then again at Lampsacus in Asia Minor; he did not, however, find very many hearers. After having for some years led an unsettled life, he returned in about the six and thirtieth year of his age to Athens, to the very centre of all Philosophy; and there, some time after, he bought for himself a garden, where he lived and taught in the midst of his friends. Though so frail in body that for many years he was unable to rise from his chair, in his manner of living he was most regular and frugal, and he devoted himself entirely to science, to the exclusion of all other interests. Even Cicero,

though in other respects he has little to say in his favour, bears testimony to the warmth of his friendships, and adds that no one can deny he was a good, a humane, and a kindly man. Diogenes Laërtius gives special commendation to his reverence towards his parents, his generosity to his brothers, and his benevolence to all. He died of stone in the seventy-first year of his age. Just before his death he had himself placed in a warm bath, drank a cup of wine, and charged his friends to remember what he had taught them.[145]

No other teacher has ever been loved and reverenced by his scholars as much as Epicurus; they lived on such intimate terms of friendship that they determined to make common stock of their possessions with him, and so continue in a permanent association, like a kind of Pythagorean brotherhood. This they were, however, forbidden to do by Epicurus himself, because it would have betrayed a distrust in their readiness to share what they had with one another; but where distrust is possible, there neither friendship, nor unity, nor constancy of attachment can find a place. After his death he was held in honoured remembrance by his disciples: they carried about with them everywhere his likeness, engraved on rings or drinking-cups, and remained so faithful to his teaching that they considered it almost a crime to make any alteration in it (while in the Stoic philosophy development was continually going on), and his school, in respect of his doctrines, resembled a closely-barricaded state to which all entrance was denied. The reason for this lies, as we shall presently see, in his system itself; and the further result, from a scientific point of view, ensued that we can name no celebrated disciples of his who carried on and completed his teaching on their own account. For his disciples could only have gained distinction for themselves by going further than Epicurus did. But to go further would have been to reach the Notion, which would only have confused the system of Epicurus; for what is devoid of thought is thrown

into confusion by the introduction of the Notion, and it is this very lack of thought which has been made a principle. Not that it is in itself without thought, but the use made of thought is to hold back thought, and thought thus takes up a negative position in regard to itself; and the philosophic activity of Epicurus is thus directed towards the restoration and maintaining of what is sensuous through the very Notion which renders it confused. Therefore his philosophy has not advanced nor developed, but it must also be said that it has not retrograded; a certain Metrodorus alone is said to have carried it on further in some directions. It is also told to the credit of the Epicurean philosophy that this Metrodorus was the only disciple of Epicurus who went over to Carneades; for the rest, it surpassed all others in its unbroken continuity of doctrine and its long duration; for all of them became degenerate or suffered interruption. When some one called the attention of Arcesilaus to this attachment to Epicurus, by the remark that while so many had gone over from other philosophers to Epicurus, scarcely a single example was known of any one passing over from the Epicurean system to another, Arcesilaus made the witty rejoinder: “Men may become eunuchs, but eunuchs can never again become men.”[146]

Epicurus himself produced in his lifetime an immense number of works, being a much more prolific author than Chrysippus, who vied with him in the number of his writings,[147] if we deduct from the latter his compilations from the works of others or from his own. The number of his writings is said to have amounted to three hundred; it is scarcely to be regretted that they are lost to us. We may rather thank Heaven that they no longer exist; philologists at any rate would have had great trouble with them. The main source of our knowledge of Epicurus is the whole of the tenth book of Diogenes Laërtius, which after all gives us but scanty information, though it deals with the subject at great length. We should, of course, have been better off had we possessed the philosopher’s own writings, but we know

enough of him to make us honour the whole. For, besides this, we know a good deal about the philosophy of Epicurus through Cicero, Sextus Empiricus and Seneca; and so accurate are the accounts they give of him, that the fragment of one of Epicurus's own writings, found some years ago in Herculaneum, and reprinted by Orelli from the Neapolitan edition (Epicuri Fragmenta libri II. et XI. De natura, illustr. Orellius, Lipsiæ 1818), has neither extended nor enriched our knowledge; so that we must in all earnestness deprecate the finding of the remaining writings.

With regard to the Epicurean philosophy, it is by no means to be looked on as setting forth a system of Notions, but, on the contrary, as a system of ordinary conceptions or even of sensuous existence, which, looked at from the ordinary point of view as perceived by the senses, Epicurus has made the very foundation and standard of truth (p. 277). A detailed explanation of how sensation can be such, he has given in his so-called Canonic. As in the case of the Stoics, we have first to speak of the manner which Epicurus adopted of determining the criterion of truth; secondly, of his philosophy of nature; and thirdly and lastly, of his moral teaching.

1. Canonical Philosophy.

Epicurus gave the name of Canonic to what is really a system of logic, in which he defines the criteria of truth, in regard to the theoretic, as in fact sensuous perceptions, and, further, as conceptions or anticipations (προλήψεις); in regard to the practical, as the passions, impulses, and affections.[148]

a. On the theoretic side the criterion, closely considered, has, according to Epicurus, three moments, which are the three stages of knowledge; first, sensuous perception, as the side of the external; secondly, ordinary conception, as the side of the internal; thirdly, opinion (δόξα), as the union of the two.

α. “Sensuous perception is devoid of reason,” being what is given absolutely. “For it is not moved by itself, nor can it, if if is moved by something else, take away from or add to” that which it is, but it is exactly what it is. “It is beyond criticism or refutation. For neither can one sensation judge another, both being alike, since both have equal authority;” — when the presentations of sight are of the same kind, every one of them must admit the truth of all the rest. “Nor can one of them pass judgment on another when they are unlike, for they each have their value as differing;” red and blue, for example, are each something individual. “Nor can one sensation pass judgment on another when they are heterogeneous; for we give heed to all. Thought, in the same way, cannot criticize the senses; for all thought itself depends on the sensation,” which forms its content. But sensuous perception may go far wrong. “The truth of what our senses perceive is first evinced by this, that the power of perception remains with us; sight and hearing are permanent powers of this kind as much as the capacity of feeling pain. In this way even the unknown” (the unperceived) “may be indicated by means of that which appears” (perception). Of this conception of objects of perception which are not immediate we shall have to speak more particularly hereafter (p. 292) in dealing with physical science. “Thus all” (unknown, imperceptible) “thoughts originated in the senses either directly in respect of their chance origin or in respect of relationship, analogy, and combination; to these operations thought also contributes something,” namely as the formal connection of the sensuous conceptions. “The fancies of the insane or of our dreams are also true; for they act upon us, but that which is not real does not act.”[149] Thus every sensuous perception is explicitly true, in so far as it shows itself to be abiding, and that which is not apparent to our senses must be apprehended after the same manner as the perception known to us. We hear Epicurus say, just as we hear it said in everyday life: What I see and hear, or, speaking

generally, what I perceive by my senses, comprises the existent; every such object of sense exists on its own account, one of them does not contradict the other, but all are on the same level of validity, and reciprocally indifferent. These objects of perception are themselves the material and content of thought, inasmuch as thought is continually making use of the images of these things.

β. "Ordinary conception is now a sort of comprehension (κατάληψις), or correct opinion or thought, or the universal indwelling power of thinking; that is to say, it is the recollection of that which has often appeared to us," — the picture. "For instance, when I say, 'this is a man,' I, with the help of previous perceptions, at once by my power of representation recognize his form." By dint of this repetition the sensuous perception becomes a permanent conception in me, which asserts itself; that is the real foundation of all that we hold true. These representations are universal, but certainly the Epicureans have not placed universality in the form of thinking, but only said it is caused by frequency of appearance. This is further confirmed by the name which is given to the image which has thus arisen within us. "Everything has its evidence (ἐναργές) in the name first conferred on it."[150] The name is the ratification of the perception. The evidence which Epicurus terms ἐνάργεια is just the recognition of the sensuous through subsumption under the conceptions already possessed, and to which the name gives permanence; the evidence of a conception is therefore this, that we affirm an object perceptible by the senses to correspond with the image. That is the acquiescence which we have found taking place with the Stoics when thought gives its assent to a content; thought, however, which recognizes the thing as its own, and receives it into itself, with the Stoics remained formal only. With Epicurus the unity of the conception of the object with itself exists also as a remembrance in consciousness, which, however, proceeds from the senses; the image, the conception, is what harmonizes

with a sense-perception. The recognition of the object is here an apprehension, not as an object of thought, but as an object of imagination; for apprehension belongs to recollection, to memory. The name, it is true, is something universal, belongs to thinking, makes the manifold simple, yea, is in a high degree ideal; but in such a way that its meaning and its content are the sensuous, and are not thus to be counted as simple, but as sensuous. In this way opinion is established instead of knowledge.

γ. In the last place, opinion is nothing but the reference of that general conception, which we have within us, to an object, a perception, or to the testimony of the senses; and that is the passing of a judgment. For in a conception we have anticipated that which comes directly before our eyes; and by this standard we pronounce whether something is a man, a tree, or not. "Opinion depends on something already evident to us, to which we refer when we ask how we know that this is a man or not. This opinion is also itself termed conception, and it may be either true or false: — true, when what we see before our eyes is corroborated or not contradicted by the testimony of the conception; false in the opposite case."[151] That is to say, in opinion we apply a conception which we already possess, or the type, to an object which is before us, and which we then examine to see if it corresponds with our mental representation of it. Opinion is true if it corresponds with the type; and it has its criterion in perceiving whether it repeats itself as it was before or not. This is the whole of the ordinary process in consciousness, when it begins to reflect. When we have the conception, it requires the testimony that we have seen or still see the object in question. From the sensuous perceptions blue, sour, sweet, and so on, the general conceptions which we possess are formed; and when an object again comes before us, we recognize that this image corresponds with this object. This is the whole criterion, and a very trivial process it is; for it goes no further than the first beginnings of the sensuous consciousness, the

immediate perception of an object. The next stage is without doubt this, that the first perception forms itself into a general image, and then the object which is present is subsumed under the general image. That kind of truth which anything has of which it can only be said that the evidence of the senses does not contradict it, is possessed by the conceptions of the unseen, for instance, the apprehension of heavenly phenomena: here we cannot approach nearer, we can see something indeed, but we cannot have the sensuous perception of it in its completeness; we therefore apply to it what we already know by other perceptions, if there is but some circumstance therein which is also present in that other perception or conception (*supra*, p. 282).

b. From these external perceptions of objects presently existing, with which we here began, the affections, the internal perceptions, which give the criteria for practical life are however distinguished; they are of two kinds, either pleasant or unpleasant. That is to say, they have as their content pleasure or satisfaction, and pain: the first, as that which peculiarly belongs to the perceiver, is the positive; but pain, as something alien to him, is the negative. It is these sensuous perceptions which determine action; they are the material from which general conceptions regarding what causes me pain or pleasure are formed; as being permanent they are therefore again conceptions, and opinion is again this reference of conception to perception, according to which I pass judgment on objects — affections, desires, and so on.[152] It is by this opinion, therefore, that the decision to do or to avoid anything is arrived at.

This constitutes the whole Canon of Epicurus, the universal standard of truth; it is so simple that nothing can well be simpler, and yet it is very abstract. It consists of ordinary psychological conceptions which are correct on the whole, but quite superficial; it is the mechanical view of conception having respect to the first beginnings of observation. But beyond this there

lies another and quite different sphere, a field that contains determinations in themselves; and these are the criteria by which the statements of Epicurus must be judged. Nowadays even Sceptics are fond of speaking of facts of consciousness; this sort of talk goes no further than the Epicurean Canon.

2. Metaphysics.

In the second place, Epicurus enters on a metaphysical explanation of how we are related to the object; for sensuous perception and outside impressions he unhesitatingly regards as our relation to external things, so that he places the conceptions in me, the objects outside of me. In raising the question of how we come by our conceptions, there lies a double question: on the one hand, since sense-perceptions are not like conceptions, but require an external object, what is the objective manner in which the images of external things enter into us? On the other hand, it may be asked how conceptions of such things as are not matter of perception arise in us; this seems to be an activity of thought, which derives conceptions such as these from other conceptions; we shall, however, see presently (pp. 287, 288) and more in detail, how the soul, which is here related to the object in independent activity, arrives at such a point.

"From the surfaces of things," says Epicurus in the first place, "there passes off a constant stream, which cannot be detected by our senses" (for things would in any other case decrease in size) and which is very fine; "and this because, by reason of the counteracting replenishment, the thing itself in its solidity long preserves the same arrangement and disposition of the atoms; and the motion through the air of these surfaces which detach themselves is of the utmost rapidity, because it is not necessary that what is detached should have any thickness;" it is only a surface. Epicurus says, "Such a conception does not contradict our senses, when we take into consideration how pictures produce their effects in a very similar way, I

mean by bringing us into sympathy with external things. Therefore emanations, like pictures, pass out from them into us, so that we see and know the forms and colours of things.”[153] This is a very trivial way of representing sense-perception. Epicurus took for himself the easiest criterion of the truth that is not seen, a criterion still in use, namely that it is not contradicted by what we see or hear. For in truth such matters of thought as atoms, the detachment of surfaces, and so forth, are beyond our powers of sight. Certainly we manage to see and to hear something different; but there is abundance of room for what is seen and what is conceived or imagined to exist alongside of one another. If the two are allowed to fall apart, they do not contradict each other; for it is not until we relate them that the contradiction becomes apparent.

“Error,” as Epicurus goes on to say on the second point “comes to pass when, through the movement that takes place within us on the conception therein wrought, such a change is effected that the conception can no longer obtain for itself the testimony of perception. There would be no truth, no likeness of our perceptions, which we receive as in pictures or in dreams or in any other way, if there were nothing on which we, as it were, put out our faculty of observation. There would be no untruth if we did not receive into ourselves another movement, which, to be sure, is conformable to the entering in of the conception, but which has at the same time an interruption.”[154] Error is therefore, according to Epicurus, only a displacement of the pictures in us, which does not proceed from the movement of perception, but rather from this, that we check their influence by a movement originating in ourselves; how this interruption is brought about will be shown more fully later on (pp. 290, 300).

The Epicurean theory of knowledge reduces itself to these few passages, some of which are also obscurely expressed, or else not very happily selected or quoted by Diogenes Laërtius; it is impossible to have a theory

less explicitly stated. Knowledge, on the side of thought, is determined merely as a particular movement which makes an interruption; and as Epicurus, as we have already seen, looks on things as made up of a multitude of atoms, thought is the moment which is different from the atoms, the vacuum, the pores, whereby resistance to this stream of atoms is rendered possible. If this negative is also again, as soul, affirmative, Epicurus in the notional determination of thinking has only reached this negativity, that we look away from something, *i.e.* we interrupt that inflowing stream. The answer to the question of what this interrupting movement exactly is, when taken for itself, is connected with the more advanced conceptions of Epicurus; and in order to discuss them more in detail, we must go back to the implicit basis of his system.

This constitutes on the whole the metaphysic of Epicurus; in it he has expounded his doctrine of the atom, but not with greater definiteness than did Leucippus and Democritus. The essence and the truth of things were to him, as they were to them, atoms and vacuum: "Atoms have no properties except figure, weight and magnitude." Atoms, as atoms, must remain undetermined; but the Atomists have been forced to take the inconsistent course of ascribing properties to them: the quantitative properties of magnitude and figure, the qualitative property of weight. But that which is in itself altogether indivisible can have neither figure nor magnitude; and even weight, direction upon something else, is opposed to the abstract repulsion of the atom. Epicurus even says: "Every property is liable to change, but the atoms change not. In all dissolutions of the composite, something must remain a constant and indissoluble, which no change can transform into that which is not, or bring from non-being into Being. This unchangeable element, therefore, is constituted by some bodies and figures. The properties are a certain relation of atoms to each other."[155] In like manner we have already seen with Aristotle (p. 178) that the tangible is the

foundation of properties: a distinction which under various forms is still always made and is in common use. We mean by this that an opposition is established between fundamental properties, such as we here have in weight, figure and magnitude, and sensuous properties, which are only in relation to us, and are derived from the former original differences. This has frequently been understood as if weight were in things, while the other properties were only in our senses: but, in general, the former is the moment of the implicit, or the abstract essence of the thing, while the latter is its concrete existence, which expresses its relation to other things.

The important matter now would be to indicate the relation of atoms to sensuous appearance, to allow essence to pass over into the negative: but here Epicurus rambles amidst the indeterminate which expresses nothing; for we perceive in him, as in the other physicists, nothing but an unconscious medley of abstract ideas and realities. All particular forms, all objects, light, colour, &c., the soul itself even, are nothing but a certain arrangement of these atoms. This is what Locke also said, and even now Physical Science declares that the basis of things is found in molecules, which are arranged in a certain manner in space. But these are empty words, and a crystal, for instance, is not a certain arrangement of parts, which gives this figure. It is thus not worth while to deal with this relation of atoms; for it is an altogether formal way of speaking, as when Epicurus again concedes that figure and magnitude, in so far as pertaining to atoms, are something different from what they are as they appear in things. The two are not altogether unlike; the one, implicit magnitude, has something in common with apparent magnitude. The latter is transitory, variable; the former has no interrupted parts,[156] that is, nothing negative. But the determination of the atoms, as originally formed in this or that fashion, and having original magnitude of such and such a kind, is a purely arbitrary invention. That interruption, which we regarded above (p. 288) as the other side to atoms,

or as vacuum, is the principle of movement: for the movement of thought is also like this and has interruptions. Thought in man is the very same as atoms and vacuum are in things, namely their inward essence; that is to say, atoms and vacuum belong to the movement of thought, or exist for this in the same way as things are in their essential nature. The movement of thinking is thus the province of the atoms of the soul; so that there takes place simultaneously therein an interruption of the inward flow of atoms from without. There is therefore nothing further to be seen in this than the general principle of the positive and negative, so that even thought is affected by a negative principle, the moment of interruption. This principle of the Epicurean system, further applied to the difference in things, is the most arbitrary and therefore the most wearisome that can be imagined.

Besides their different figures, atoms have also, as the fundamental mode in which they are affected, a difference of movement, caused by their weight; but this movement to some extent deviates from the straight line in its direction. That is to say, Epicurus ascribes to atoms a curvilinear movement, in order that they may impinge on one another and so on.[157] In this way there arise particular accumulations and configurations; and these are things.

Other physical properties, such as taste and smell, have their basis again in another arrangement of the molecules. But there is no bridge from this to that, or what results is simply empty tautology, according to which the parts are arranged and combined as is requisite in order that their appearance may be what it is. The transition to bodies of concrete appearance Epicurus has either not made at all, or what has been cited from him as far as this matter is concerned, taken by itself, is extremely meagre.

The opinion that one hears expressed respecting the Epicurean philosophy is in other respects not unfavourable; and for this reason some further details must be given regarding it. For since absolute Being is

constituted by atoms scattered and disintegrated, and by vacuum, it directly follows that Epicurus denies to these atoms any relationship to one another which implies purpose. All that we call forms and organisms, or generally speaking, the unity of Nature's end, in his way of thinking, belongs to qualities, to an external connection of the configurations of the atoms, which in this way is merely an accident, brought about by their chance-directed motion; the atoms accordingly form a merely superficial unity, and one which is not essential to them. Or else Epicurus altogether denies that Notion and the Universal are the essential, and because all originations are to him chance combinations, for him their resolution is just as much a matter of chance. The divided is the first and the truly existent, but at the same time chance or external necessity is the law which dominates all cohesion. That Epicurus should in this fashion declare himself against a universal end in the world, against every relation of purpose — as, for instance, the inherent conformity to purpose of the organism — and, further, against the teleological representations of the wisdom of a Creator in the world, his government, &c., is a matter of course; for he abrogates unity, whatever be the manner in which we represent it, whether as Nature's end in itself, or as end which is in another, but is carried out in Nature. In contrast to this, the teleological view enters largely into the philosophy of the Stoics, and is there very fully developed. To show that conformity to an end is lacking, Epicurus brings forward the most trivial examples; for instance, that worms and so on are produced by chance from mud through the warmth of the sun. Taken in their entirety, they may very well be the work of chance in relation to others; but what is implicit in them, their Notion and essence is something organic: and the comprehension of this is what we have now to consider. But Epicurus banishes thought as implicit, without its occurring to him that his atoms themselves have this very nature of thought; that is, their existence in time is not immediate but essentially

mediate, and thus negative or universal; — the first and only inconsistency that we find in Epicurus, and one which all empiricists are guilty of. The Stoics take the opposite course of finding essential Being in the object of thought or the universal; and they fail equally in reaching the content, temporal existence, which, however, they most inconsistently assume. We have here the metaphysics of Epicurus; nothing that he says farther on this head is of interest.

3. Physics.

The natural philosophy of Epicurus is based on the above foundation; but an aspect of interest is given it by the fact that it is still peculiarly the method of our times; his thoughts on particular aspects of Nature are, however, in themselves feeble and of little weight, containing nothing but an ill-considered medley of all manner of loose conceptions. Going further, the principle of the manner in which Epicurus looks on nature, lies in the conceptions he forms, which we have already had before us (pp. 282, 285). That is to say, the general representations which we receive through the repetition of several perceptions, and to which we relate such perceptions in forming an opinion, must be then applied to that which is not exactly matter of perception, but yet has something in common with what we can perceive. In this way it comes about that by such images we can apprehend the unknown which does not lend itself immediately to perception; for from what is known we must argue to what is unknown. This is nothing else but saying that Epicurus judged by analogy, or that he makes so-called evidence the principle of his view of Nature; and this is the principle which to this day has authority in ordinary physical science. We go through experiences and make observations, these arising from the sensuous perceptions which are apt to be overlooked. Thus we reach general concepts, laws, forces, and so on, electricity and magnetism, for instance, and these are then applied by

us to such objects and activities as we cannot ourselves directly perceive. As an example, we know about the nerves and their connection with the brain; in order that there may be feeling and so on, it is said that a transmission from the finger-tips to the brain takes place. But how can we represent this to ourselves? We cannot make it a matter of observation. By anatomy we can lay bare the nerves, it is true, but not the manner of their working. We represent these to ourselves on the analogy of other phenomena of transmission, for instance as the vibration of a tense string that passes through the nerves to the brain. As in the well-known phenomenon of a number of billiard balls set close together in a row, the last of which rolls away when the first is struck, while those in the middle, through each of which the effect of the stroke has been communicated to the next, scarcely seem to move, so we represent to ourselves the nerves as consisting of tiny balls which are invisible even through the strongest magnifying glass, and fancy that at every touch, &c., the last springs off and strikes the soul. In the same way light is represented as filaments, rays, or as vibrations of the ether, or as globules of ether, each of which strikes on the other. This is an analogy quite in the manner of Epicurus.

In giving such explanations as those above, Epicurus professed to be most liberal, fair and tolerant, saying that all the different conceptions which occur to us in relation to sensuous objects — at our pleasure, we may say, — can be referred to that which we cannot ourselves directly observe; we should not assert any one way to be the right one, for many ways may be so. In so saying, Epicurus is talking idly; his words fall on the ear and the fancy, but looked on more narrowly they disappear. So, for instance, we see the moon shine, without being able to have any nearer experience of it. On this subject Epicurus says: "The moon may have its own light, or a light borrowed from the sun; for even on earth we see things which shine of themselves, and many which are illuminated by others. Nothing hinders us

from observing heavenly things in the light of various previous experiences, and from adopting hypotheses and explanations in accordance with these. The waxing and waning of the moon may also be caused by the revolution of this body, or through changes in the air" (according as vapour is modified in one way or another), "or also by means of adding and taking away somewhat: in short, in all the ways whereby that which has a certain appearance to us is caused to show such appearance." Thus there are to be found in Epicurus all these trivialities of friction, concussion, &c., as when he gives his opinion of lightning on the analogy of how we see fire of other kinds kindled: "Lightning is explained by quite a large number of possible conceptions; for instance, that through the friction and collision of clouds the figuration of fire is emitted, and lightning is produced." In precisely the same way modern physicists transfer the production of an electric spark, when glass and silk are rubbed against each other, to the clouds. For, as we see a spark both in lightning and electricity, we conclude from this circumstance common to both that the two are analogical; therefore, we come to the conclusion that lightning also is an electric phenomenon. But clouds are not hard bodies, and by moisture electricity is more likely to be dispersed; therefore, such talk has just as little truth in it as the fancy of Epicurus. He goes on to say: "Or lightning may also be produced by being expelled from the clouds by means of the airy bodies which form lightning — by being struck out when the clouds are pressed together either by each other or by the wind," &c. With the Stoics things are not much better. Application of sensuous conceptions according to analogy is often termed comprehension or explanation, but in reality there is in such a process not the faintest approach to thought or comprehension. "One man," adds Epicurus, "may select; one of these modes, and reject the others, not considering what is possible for man to know, and what is impossible, and therefore striving to attain to a knowledge of the unknowable."[158]

This application of sensuous images to what has a certain similarity to them, is pronounced to be the basis and the knowledge of the cause, because, in his opinion, a transference such as this cannot be corroborated by the testimony of mere immediate sensation; thus the Stoic method of seeking a basis in thought is excluded, and in this respect the mode of explanation adopted by Epicurus is directly opposed to that of the Stoics. One circumstance which strikes us at once in Epicurus is the lack of observation and experience with regard to the mutual relations of bodies: but the kernel of the matter, the principle, is nothing else than the principle of modern physics. This method of Epicurus has been attacked and derided, but on this score no one need be ashamed of or fight shy of it, if he is a physicist; for what Epicurus says is not a whit worse than what the moderns assert. Indeed, in the case of Epicurus the satisfactory assurance is likewise always present of his emphasizing the fact most strongly that just because the evidence of the senses is found to be lacking, we must not take our stand on any one analogy. Elsewhere he in the same way makes light of analogy, and when one person accepts this possibility and another that other possibility, he admires the cleverness of the second and troubles himself little about the explanation given by the first; it may be so, or it may not be so.[159] This is a method devoid of reason, which reaches no further than to general conceptions. Nevertheless, if Physical Science is considered to relate to immediate experience on the one hand, and, on the other hand — in respect of that which cannot be immediately experienced — to relate to the application of the above according to a resemblance existing between it and that which is not matter of experience, in that case Epicurus may well be looked on as the chief promoter, if not the originator of this method, and also as having asserted that it is identical with knowledge. Of the Epicurean method in philosophy we may say this, that it likewise has a side on which it possesses value, and we may in some measure assent when we hear, as

we frequently do, the Epicurean physics favourably spoken of. Aristotle and the earlier philosophers took their start in natural philosophy from universal thought *a priori*, and from this developed the Notion; this is the one side. The other side, which is just as necessary, demands that experience should be worked up into universality, that laws should be found out; that is to say, that the result which follows from the abstract Idea should coincide with the general conception to which experience and observation have led up. The *a priori* is with Aristotle, for instance, most excellent but not sufficient, because to it there is lacking connection with and relation to experience and observation. This leading up of the particular to the universal is the finding out of laws, natural forces, and so on. It may thus be said that Epicurus is the inventor of empiric Natural Science, of empiric Psychology. In contrast to the Stoic ends, conceptions of the understanding, experience is the present as it appears to the senses: there we have abstract limited understanding, without truth in itself, and therefore without the present in time and the reality of Nature; here we have this sense of Nature, which is more true than these other hypotheses.

The same effect which followed the rise of a knowledge of natural laws, &c., in the modern world was produced by the Epicurean philosophy in its own sphere, that is to say, in so far as it is directed against the arbitrary invention of causes. The more, in later times, men made acquaintance with the laws of Nature, the more superstition, miracles, astrology, &c. disappeared; all this fades away owing to the contradiction offered to it by the knowledge of natural laws. The method of Epicurus was directed more especially against the senseless superstition of astrology, &c., in whose methods there is neither reason nor thought, for it is quite a thing of the imagination, downright fabrication being resorted to, or what we may even term lying. In contrast with this, the way in which Epicurus works, when the conceptions and not thought are concerned, accords with truth. For it

does not go beyond what is perceived by the sight, and hearing, and the other senses, but keeps to what is present and not alien to the mind, not speaking of certain things as if they could be seen and heard, when that is quite impossible, seeing that the things are pure inventions. The effect of the Epicurean philosophy in its own time was therefore this, that it set itself against the superstition of the Greeks and Romans, and elevated men above it.[160] All the nonsense about birds flying to right or to left, or a hare running across the path, or men deciding how they are to act according to the entrails of animals, or according as chickens are lively or dull — all that kind of superstition the Epicurean philosophy made short work of, by permitting that only to be accepted as truth which is counted as true by sense perception through the instrumentality of anticipations; and from it more than anything those conceptions which have altogether denied the supersensuous have proceeded. The physics of Epicurus were therefore famous for the reason that they introduced more enlightened views in regard to what is physical, and banished the fear of the gods. Superstition passes straightway from immediate appearances to God, angels, demons; or it expects from finite things other effects than the conditions admit of, phenomena of a higher kind. To this the Epicurean natural philosophy is utterly opposed, because in the sphere of the finite it refuses to go beyond the finite, and admits finite causes alone; for the so-called enlightenment is the fact of remaining in the sphere of the finite. There connection is sought for in other finite things, in conditions which are themselves conditioned; superstition, on the contrary, rightly or wrongly, passes at once to what is above us. However correct the Epicurean method may be in the sphere of the conditioned, it is not so in other spheres. Thus if I say that electricity comes from God, I am right and yet wrong. For if I ask for a cause in this same sphere of the conditioned, and give God as answer, I say too much; though this answer fits all questions, since God is the cause of everything,

what I would know here is the particular connection of the phenomenon. On the other hand, in this sphere even the Notion is already something higher; but this loftier way of looking at things which we met with in the earlier philosophers, was quite put an end to by Epicurus, since with superstition there also passed away self-dependent connection and the world of the Ideal.

To the natural philosophy of Epicurus there also belongs his conception of the soul, which he looks on as having the nature of a thing, just as the theories of our own day regard it as nerve-filaments, cords in tension, or rows of minute balls (p. 294). His description of the soul has therefore but little meaning, since here also he draws his conclusion by analogy, and connects therewith the metaphysical theory of atoms: "The soul consists of the finest and roundest atoms, which are something quite different from fire, being a fine spirit which is distributed through the whole aggregate of the body, and partakes of its warmth." Epicurus has consequently established a quantitative difference only, since these finest atoms are surrounded by a mass of coarser atoms and dispersed through this larger aggregate. "The part which is devoid of reason is dispersed in the body" as the principle of life, "but the self-conscious part (τὸ λογικόν) is in the breast, as may be perceived from joy and sadness. The soul is capable of much change in itself, owing to the fineness of its parts, which can move very rapidly: it sympathizes with the rest of the aggregate, as we see by the thoughts, emotions and so on; but when it is taken away from us we die. But the soul, on its part, has also the greatest sympathy with sensuous perception; yet it would have nothing in common with it, were it not in a certain measure covered by the rest of the aggregate" (the body) — an utterly illogical conception. "The rest of this aggregate, which this principle provides for the soul, is thereby also partaker, on its part, of a like condition" (sensuous perception), "yet not of all that the former possesses; therefore, when the

soul escapes, sensuous perception exists no more for it. The aggregate spoken of above has not this power in itself, but derives it from the other which is brought into union with it, and the sentient movement comes to pass through the flow of sympathy which they have in common."[161] Of such conceptions it is impossible to make anything. The above-mentioned (p. 287) interruption of the streaming together of images of external things with our organs, as the ground of error, is now explained by the theory that the soul consists of peculiar atoms, and the atoms are separated from one another by vacuum. With such empty words and meaningless conceptions we shall no longer detain ourselves; we can have no respect for the philosophic thoughts of Epicurus, or rather he has no thoughts for us to respect.

4. Ethics.

Besides this description of the soul the philosophy of mind contains the ethics of Epicurus, which of all his doctrines are the most decried, and therefore the most interesting; they may, however, also be said to constitute the best part of that philosophy. The practical philosophy of Epicurus depends on the individuality of self-consciousness, just as much as does that of the Stoics; and the end of his ethics is in a measure the same, the unshaken tranquillity of the soul, and more particularly an undisturbed pure enjoyment of itself. Of course, if we regard the abstract principle involved in the ethics of Epicurus, our verdict cannot be other than exceedingly unfavourable. For if sensation, the feeling of pain and pleasure, is the criterion for the right, good, true, for that which man should make his aim in life, morality is really abrogated, or the moral principle is in fact not moral; at least we hold that the way is thereby opened up to all manner of arbitrariness in action. If it is now alleged that feeling is the ground of action, and that because I find a certain impulse in myself it is for that

reason right — this is Epicurean reasoning. Everyone may have different feelings, and the same person, may feel differently at different times; in the same way with Epicurus it may be left to the subjectivity of the individual to determine the course of action. But it is of importance to notice this, that when Epicurus sets tip pleasure as the end, he concedes this only so far as its enjoyment is the result of philosophy. We have before now remarked (vol. i., p. 470) that even with the Cyrenaics, while on the one hand sensation was certainly made the principle, on the other hand it was essential that thought should be in intimate connection with it. Similarly it is the case with Epicurus that while he designated pleasure as the criterion of the good, he demanded a highly cultured consciousness, a power of reflection, which weighs pleasure to see if it is not combined with a greater degree of pain, and in this way forms a correct estimate of what it is. Diogenes Laërtius (X. 144) quotes from him with regard to this point of view: "The wise man owes but little to chance; Reason attains what is of the greatest consequence, and both directs it and will direct it his whole life long." The particular pleasure is therefore regarded only with reference to the whole, and sensuous perception is not the one and only principle of the Epicureans; but while they made pleasure the principle, they made a principle at the same time of that happiness which is attained, and only attainable by reason; so that this happiness is to be sought in such a way that it may be free and independent of external contingencies, the contingencies of sensation. The true Epicureans were therefore, just as much as the Stoics, raised above all particular ties, for Epicurus, too, made his aim the undisturbed tranquillity of the wise man. In order to be free from superstition Epicurus specially requires physical science, as it sets men free from all the opinions which most disturb their rest — opinions regarding the gods, and their punishments, and more particularly from the thought of death.[162] Freed from all this fear, and from the imaginings of the

men who make any particular object their end and aim, the wise man seeks pleasure only as something universal, and holds this alone to be positive. Here the universal and the particular meet; or the particular, regarded only in its bearings to the whole, is raised into the form of universality. Thus it happens that, while materially, or as to content, Epicurus makes individuality a principle, on the other hand he requires the universality of thinking, and his philosophy is thus in accordance with that of the Stoics.

Seneca, who is known as a thorough-going and uncompromising Stoic, when in his treatise *De Vita Beata* (c. 12, 13) he happens to speak of the Epicureans, gives testimony which is above suspicion to the ethical system of Epicurus: "My verdict is, however — and in thus speaking I go, to some extent, against many of my own countrymen — that the moral precepts of Epicurus prescribe a way of life that is holy and just, and, when closely considered, even sorrowful. For every pleasure of Epicurus turns on something very paltry and poor, and we scarcely know how restricted it is, and how insipid. The self-same law which we lay down for virtue he prescribes for pleasure; he requires that Nature be obeyed; but very little in the way of luxury is required to satisfy Nature. What have we then here? He who calls a lazy, self-indulgent, and dissolute life happiness merely seeks a good authority for a thing that is evil, and while, drawn on by a dazzling name, he turns in the direction where he hears the praise of pleasure sounding, he does not follow the pleasures to which he is invited by Epicurus, but those which he himself brings with him. Men who thus abandon themselves to crime seek only to hide their wickedness under the mantle of philosophy, and to furnish for their excesses a pretext and an excuse. Thus it is by no means permitted that youth should hold up its head again for the reason that to the laxity of its morality an honourable title has been affixed." By the employment of our reflective powers, which keep guard over pleasure and consider whether there can be any enjoyment in

that which is fraught with dangers, fear, anxiety and other troubles, the possibility of our obtaining pleasure pure and unalloyed is reduced to a minimum. The principle of Epicurus is to live in freedom and ease, and with the mind at rest, and to this end it is needful to renounce much of that which men allow to sway them, and in which they find their pleasure. The life of a Stoic is therefore but little different from that of an Epicurean who keeps well before his eyes what Epicurus enjoins.

It might perhaps occur to us that the Cyrenaics had the same moral principle as the Epicureans, but Diogenes Laërtius (X. 139, 136, 137) shows us the difference that there was between them. The Cyrenaics rather made pleasure as a particular thing their end, while Epicurus, on the contrary, regarded it as a means, since he asserted painlessness to be pleasure, and allowed of no intermediate state. "Neither do the Cyrenaics recognize pleasure in rest (καταστηματικήν), but only in the determination of motion," or as something affirmative, that consists in the enjoyment of the pleasant; "Epicurus, on the contrary, admits both — the pleasure of the body as well as that of the soul." He meant by this that pleasure in rest is negative, as the absence of the unpleasant, and also an inward contentment, whereby rest is maintained within the mind. Epicurus explained these two kinds of pleasure more clearly as follows: "Freedom from fear and desire (ἀταραξία) and from pain and trouble (ἀπονία) are the passive pleasures (καταστηματικὶα ἡδοναί)," — the setting of our affections on nothing which we may run the risk of losing; pleasures of the senses, on the other hand, like "joy and mirth (χαρὰ δὲ καὶ εὐφροσύνη), are pleasures involving movement (κατὰ κίνησιν ἐνεργείᾳ βλέπονται.9)" The former pleasures Epicurus held to be the truest and highest. "Besides this, pain of the body was held by the Cyrenaics to be worse than sorrow of the soul, while with the Epicureans this is reversed."

The main teaching of Epicurus in respect of morals is contained in a letter to Men\nceus, which Diogenes Laërtius has preserved, and in which

Epicurus expresses himself as follows: “The youth must neither be slow to study philosophy, nor must the old man feel it a burden, for no one is either too young or too old to study the health of his soul. We must therefore endeavour to find out wherein the happy life consists; the following are its elements: First, we must hold that God is a living Being, incorruptible and happy, as the general belief supposes Him to be; and that nothing is lacking to His incorruptibility nor to His happiness. But though the existence of the gods is known to be a fact, yet they are not such as the multitude suppose them to be. He is therefore not impious who discards his faith in the gods of the multitude, but he who applies to them the opinions entertained of them by the mass.” By these gods of Epicurus we can understand nothing else than the Holy, the Universal, in concrete form. The Stoics held more to the ordinary conception, without indeed giving much thought to the Being of God; with the Epicureans, on the other hand, the gods express an immediate Idea of the system. Epicurus says: “That which is holy and incorruptible has itself no trouble nor causes it to others; therefore it is unstirred by either anger or show of favour, for it is in weakness only that such find a place. The gods may be known by means of Reason; they consist partly in Number; others are the perfected type of man, which, owing to the similarity of the images, arises from the continuous confluence of like images on one and the same subject.”[163] The gods are thus the altogether general images which we receive into ourselves; and Cicero says (De Natura Deorum, 18, 38) that they come singly upon us in sleep. This general image, which is at the same time an anthropomorphic conception, is the same to which we give the name of Ideal, only that here the source assigned to it is the reiterated occurrence of images. The gods thus seem to Epicurus to be Ideals of the holy life; they are also existent things, consisting of the finest atoms; they are, however, pure souls, unmixed with any grosser element, and therefore exempt from toil and trouble and pain.

Their self-enjoyment is wholly passive, as it must be if consistent, for action has always in it something alien, the opposition of itself and reality, and the toil and trouble which are involved in it really represent the aspect of consciousness of opposition rather than that of realization. The gods lead an existence of pure and passive self enjoyment, and trouble themselves not with the affairs of the world and of men. Epicurus goes on to say: “Men must pay reverence to the gods on account of the perfection of their nature and their surpassing holiness, not in order to gain from them some special good, or for the sake of this or that advantage,”[164] The manner in which Epicurus represents the gods as corporeal Beings in human likeness has been much derided; thus Cicero, for instance, in the passage quoted (c. 18) laughs at Epicurus for alleging that the gods have only *quasi* bodies, flesh and blood. But from this there follows only that they are, as it were, the implicit, as we see it stated of the soul and things palpable to the senses, that they have behind them what is implicit. Our talk of qualities is no better; for if justice, goodness, and so on, are to be taken *in sensu eminentiori*, and not as they are with men, we have in God a Being in the same way possessed of only something resembling justice and the other qualities. With this there is closely connected the theory of Epicurus that the gods dwell in vacant space, in the intermediate spaces of the world, where they are exposed neither to rain or wind or snow or the like.[165] For the intermediate spaces are the vacuum, wherein, as the principle of movement, are the atoms in themselves. Worlds, as phenomena, are complete continuous concretions of such atoms, but concretions which are only external relations. Between them, as in vacuum, there are thus these Beings also, which themselves are certainly concretions of atoms, but concretions which remain implicit. Yet this leads only to confusion, if a closer definition is given, for concretion constitutes what is for the senses, but the gods, even if they were concretions, would not be realities exactly such as these. In

illogical fashion the general, the implicit, is taken out of reality and set above it, not as atoms, but just as before, as a combination of these atoms; in this way this combination is not itself the sensuous. This seems ridiculous, but it is connected with the interruptions spoken of, and with the relation of the vacuum to the plenum, the atom. So far, therefore, the gods belong to the category of negativity as against sensuality, and as this negative is thought, in that sense what Epicurus said of the gods may still to some extent be said. To this determination of God a larger measure of objectivity of course belongs, but it is a perfectly correct assertion that God, as Thought, is a holy Being, to whom reverence is due for His own sake alone. The first element in a happy life is therefore reverence for the gods, uninfluenced by fear or hope.

Further, a second point with Epicurus is the contemplation of death, the negative of existence, of self-consciousness in man; he requires us to have a true conception of death, because otherwise it disturbs our tranquillity. He accordingly says: "Accustom thyself then to the thought that death concerns us not; for all good and evil is a matter of sensation, but death is a deprivation (στέρησις) of sensation. Therefore the true reflection that death is no concern of ours, makes our mortal life one of enjoyment, since this thought does not add an endless length of days, but does away with the longing after immortality. For nothing in life has terrors for him who has once truly recognized the fact that not to live is not a matter of dread. Thus it is a vain thing to fear death, not because its presence but because the anticipation of it brings us pain. For how can the anticipation of a thing pain us when its reality does not? There is therefore in death nothing to trouble us. For when we are in life, death is not there, and when death is there, we are not. Therefore death does not concern either the living or the dead." This is quite correct, if we look at the immediate; it is a thought full of meaning, and drives away fear. Mere privation, which death is, is not to be

confounded with the feeling of being alive, which is positive; and there is no reason for worrying oneself about it. “But the future in general is neither ours, nor is it not ours; hence we must not count upon it as something that will come to pass, nor yet despair of it, as if it would not come to pass.”[166] It is no concern of ours either that it is or that it is not; and it need not therefore cause us uneasiness. This the right way in which to regard the future also.

Epicurus passes on to speak of impulses, saying: “This moreover is to be kept in mind, that amongst impulses some are natural, but others are vain; and of those that are natural some are necessary while others are natural only. Those that are necessary are either necessary to happiness, or tend to save the body from pain, or to self-preservation in general. The perfect theory teaches how to choose that which promotes health of body and steadfastness of soul, and how to reject what impairs them, this being the aim of the holy life. This is the end of all our actions, to have neither pain of body nor uneasiness of mind. If we but attain to this, all turmoil of the soul is stilled, since the life no longer has to strive after something which it needs, and no longer has to seek anything outside of itself by which the welfare of soul and body is arrived at. But even on the supposition that pleasure is the first and the inborn good, we do not for that reason choose all pleasures, but many we renounce, when they are more than counterbalanced by their painful results; and many pains we prefer to pleasures, if there follows from them a pleasure that is greater. Contentment we hold to be a good, not that we may aim at merely reducing our requirements to a minimum, as the Cynics did, but that we may seek not to be discontented even when we have not very much, knowing that they most enjoy abundance who can do without it, and that what is naturally desired is easy to procure, while what is a mere idle fancy can be procured only with difficulty. Simple dishes afford just as much enjoyment as costly banquets,

if they appease hunger. Therefore when we make pleasure our aim, it is not the enjoyments of the gourmand, as is often falsely thought, but freedom from both pain of body and uneasiness of mind. We attain to this life of happiness by sober reason alone, which examines the grounds of all choice and all rejection, and expels the thoughts by which the soul's rest is most disturbed. It is surely better to be unhappy and reasonable than to be happy and unreasonable; for it is better that in our actions we should judge correctly than that we should be favoured by luck. Meditate on this day and night, and let thyself be shaken by nought from thy peace of soul, that thou mayest live as a god amongst men; for the man who lives amongst such imperishable treasures has nothing in common with mortal men. Of all those the first and foremost is reasonableness (φρόνησις), which on this account is still more excellent than philosophy; from it spring all the other virtues. For they show that one cannot live happily, unless he lives wisely and honourably and justly: nor can he live wisely and honourably and justly without living happily."[167]

Therefore, although at first sight there seems not much to be said for the principle of Epicurus, nevertheless by means of the inversion of making the guiding principle to be found in thought proceeding from Reason, it passes into Stoicism, as even Seneca himself has admitted (*v. supra*, pp. 302, 303); and actually the same result is reached as with the Stoics. Hence the Epicureans describe their wise man in at least as glowing terms as the Stoics do theirs; and in both these systems the wise man is depicted with the same qualities, these being negative. With the Stoics the Universal is the essential principle, — not pleasure, the self-consciousness of the particular as particular; but the reality of this self-consciousness is equally something pleasant. With the Epicureans pleasure is the essential principle, but pleasure sought and enjoyed in such a way that it is pure and unalloyed, that is to say, in accordance with sound judgment, and with no greater evil

following to destroy it: therefore pleasure is regarded in its whole extent, that is, as being itself a universal. In Diogenes Laërtius, however (X. 117-121), the Epicurean delineation of the wise man has a character of greater mildness; he shapes his conduct more according to laws already in operation, while the Stoic wise man, on the other hand, does not take these into account at all. The Epicurean wise man is less combative than the Stoic, because the latter makes his starting-point the thought of self-dependence, which, while denying self, exercises activity: the Epicureans, on the other hand, proceed from the thought of existence, which is not so exacting, and seeks not so much this activity directed outwards, as rest; this, however, is not won by lethargy, but by the highest mental culture. Yet although the content of the Epicurean philosophy, its aim and result, stands thus on as high a level as the Stoic philosophy, and is its exact parallel, the two are nevertheless in other respects directly opposed to one another; but each of these systems is one-sided, and therefore both of them are dogmatisms inconsistent with themselves by the necessity of the Notion, that is, they contain the contrary principle within them. The Stoics take the content of their thought from Being, from the sensuous, demanding that thought should be the thought of something existent: the Epicureans, on the contrary, extend their particularity of existence to the atoms which are only things of thought, and to pleasure as a universal; but in accordance with their respective principles, both schools know themselves to be definitely opposed to each other.

The negative mean to these one-sided principles is the Notion, which, abrogating fixed extremes of determination such as these, moves them and sets them free from a mere state of opposition. This movement of the Notion, the revival of dialectic — directed as it is against these one-sided principles of abstract thinking and sensation — we now see in its negative aspect, both in the New Academy and in the Sceptics. Even the Stoics, as

having their principle in thought, cultivated dialectic, though theirs was (pp. 254, 255) a common logic, in which the form of simplicity passes for the Notion, while the Notion, as such, represents the negative element in it, and dissolves the determinations, which are taken up into that simplicity. There is a higher form of the Notion of dialectic reality, which not only applies itself to sensuous existence, but also to determinate Notions, and which brings to consciousness the opposition between thought and existence; not expressing the Universal as simple Idea, but as a universality in which all comes back into consciousness as an essential moment of existence. In Scepticism we now really have an abrogation of the two one-sided systems that we have hitherto dealt with; but this negative remains negative only, and is incapable of passing into an affirmative.

C. The New Academy.

As opposed to the Stoic and Epicurean Dogmatism, we first of all have the New Academy, which is a continuation of Plato's Academy in as far as the followers of Plato are divided into the Old, Middle, and New Academies; some indeed allow of a fourth Academy and even a fifth.[168] The most noteworthy figures here are those of Arcesilaus and Carneades. The establishment of the Middle Academy is ascribed to Arcesilaus, and the New Academy is said to contain the philosophy of Carneades; but this distinction has no signification. Both of these are closely connected with Scepticism, and the Sceptics themselves have often trouble in distinguishing their standpoint from the Academic principle. Both have been claimed by Scepticism as Sceptics, but between the Academics and pure Scepticism a distinction has been drawn, which is certainly very formal, and has but little signification, but to which the Sceptics in their subtlety undoubtedly attached some meaning. The distinction often consists in the meanings of words only, and in quite external differences.

The standpoint of the Academics is that they express the truth as a subjective conviction of self-consciousness; and this tallies with the subjective idealism of modern times. The truth, in so far as it is only a subjective conviction, has hence been called, by the New Academy, the *probable*. Although followers of Plato, and hence, Platonists, the Academicians did not remain at the standpoint of Plato, nor could they have done so. But we easily see the connection of this principle with the Platonic doctrines, if we recollect that with Plato the Idea has been the principle, and that, indeed, on the whole, in the form of universality. Plato remained, as we saw above (pp. 139, 140), in the abstract Idea; to him the one great matter in

Philosophy is to combine the infinite and finite. Plato's Ideas are derived from the necessities of reason, from enthusiasm for the truth, but they are in themselves devoid of movement, and only universal, while Aristotle demands actuality, self-determining activity. Plato's dialectic has only attempted to assert the universal as such, and to demonstrate the determinate and particular to be null, thus leaving nothing at all but abstract universality. His dialectic has hence very often a negative result, in which determinations are merely done away with and annulled. With Plato the working out of the concrete has thus not gone far, and where he, as in the Timæus, proceeds into the determinate, *e.g.* of organic life, he becomes infinitely trivial and quite unspeculative, while with Aristotle matters are very different. The necessity for a scientific ground has necessarily caused us to be carried on beyond this Platonic point of view. The Stoics and Epicureans were imbued with the scientific necessity, not yet recognized by Plato, of giving a content to the universal of the Idea, *i.e.* of grasping particular determinateness, but the succeeding Academicians stand in a negative attitude to them in this regard. To the end they made a point of holding to the Platonic universality, uniting to this the Platonic dialectic also. The principle of the New Academy could thus, like the Platonic dialectic, possess a dialectic attitude and bearing which proceeded to nothing affirmative; as, indeed, in many of Plato's dialogues, mere confusion is what is arrived at. But while with Plato the affirmative result is essentially the result of dialectic, so that with him we have really found the universal Idea as species, during all this time, on the other hand, the tendency to abstract apprehension is predominant; and as this showed itself in the Stoic and Epicurean philosophy, it has also extended to the Platonic Idea and degraded it into being a form of the understanding. Plato's Ideas were thus torn from their rest through thought, because in such universality thought has not yet recognized itself as self-consciousness. Self-

consciousness confronted them with great pretensions, actuality in general asserted itself against universality; and the rest of the Idea necessarily passed into the movement of thought. This movement now, however, in the New Academy turned dialectically against the determination of the Stoics and Epicureans, which rested on the fact that the criterion of the truth ought to be a concrete. For example, in the conception as comprehended by the Stoics, there is a thought which likewise has a content, although, again, this union still remains very formal. But the two forms in which the dialectic of the New Academy turns against this concrete, are represented by Arcesilaus and Carneades.

1. Arcesilaus.

Arcesilaus kept to the abstraction of the Idea as against the criterion; for though in the Idea of Plato, *i.e.* in the Timæus and in his dialectic, the concrete was derived from quite another source, this was only admitted for the first time later on by the Neo-platonists, who really recognized the unity of the Platonic and the Aristotelian principles. The opposition to the Dogmatists thus does not in the case of Arcesilaus proceed from the dialectic of the Sceptics, but from keeping to abstraction; and here we perceive the gulf marking out this epoch from any other.

Arcesilaus was born at Pitane in Æolia in the 116th Olympiad (318 B.C.), and was a contemporary of Epicurus and Zeno. Though he originally belonged to the Old Academy, yet the spirit of the time and the progressive development of Philosophy did not now admit of the simplicity of the Platonic manner. He possessed considerable means, and devoted himself entirely to the studies requisite for the education of a noble Greek, viz. to rhetoric, poetry, music, mathematics, &c. Mainly for the purpose of exercising himself in rhetoric, he came to Athens, here was introduced to Philosophy, and lived henceforth for its sake alone; he held intercourse with

Theophrastus, Zeno, &c., and it is a subject of dispute whether he did not hear Pyrrho also. Arcesilaus, familiar with all the Philosophy of those days, was by his contemporaries held to be as noble a man as he was a subtle and acute philosopher; being without pride in himself, he recognized the merits of others. He lived in Athens, occupied the post of scholarch in the Academy, and was thus a successor of Plato. After the death of Crates, the successor of Speusippus, the place of honour in the Academy devolved on Sosicrates, but he willingly gave it up in favour of Arcesilaus on account of the superiority of the latter in talent and philosophy. What really happened as regards the transference of the chair to others, is, for the rest, unknown to us. He filled this office, in which he made use of the method of disputation, with approbation and applause, until his death, which took place in Olympiad 134, 4 (244 B.C.), in the seventy-fourth year of his age.[169]

The principal points in the philosophy of Arcesilaus are preserved by Cicero in his *Academics Quæstiones*, but Sextus Empiricus is more valuable as an authority, for he is more thorough, definite, philosophic and systematic.

a. This philosophy is specially known to us as being a dialectic directed against Stoicism, with which Arcesilaus had much to do, and its result, as far as its main principles are concerned, is expressed thus: "The wise man must restrain his approbation and assent."[170] This principle was called ἐποχή, and it is the same as that of the Sceptics; on the other hand this expression is connected with the principle of the Stoics as follows. Because to Stoic philosophy truth consists in the fact that thought declares some content of existence to be its own, and the conception as comprehended gives its approbation to this content, the content of our conceptions, principles and thoughts undoubtedly appears to be different from thought, and the union of the two, which is the concrete, only arises by means of some determinate content being taken up into the form of thought and thus

being expressed as the truth. But Arcesilaus saw this consequence, and his saying that approbation most be withheld is thus as much as saying that by thus taking up the content no truth comes to pass, but only phenomenon; and this is true, because, as Arcesilaus puts it, conception and thought likewise remain apart. Arcesilaus has certainly unthinkingly allowed that this content united to consciousness is a concrete such as was indicated, only he has asserted that this connection merely gives a perception with a good ground, and not what he calls truth. This is called probability, but not quite appropriately; it is a universal set forth through the form of thought, and is only formal, having no absolute truth. Sextus (Pyrrh. Hyp. I. c. 33, § 233) puts this plainly in saying that "Arcesilaus has declared the withholding of approbation in relation to parts, to be a good, but the assenting to parts to be an evil," because the assent only concerns *parts*. That is, if thought is to be retained as a universal, it cannot come to be a criterion; and that is the meaning of Arcesilaus when he asks that the wise man should remain at the universal, and not go on to the determinate as if this determinate were the truth.

Sextus Empiricus gives us (adv. Math. VII. 155, 151-153) a more particular explanation of this philosophy, which is preserved to us only as being in opposition to the Stoics. Arcesilaus asserted as against the Stoics, that everything is incomprehensible (ἀκατάληπτα). He thus combated the conception of thought (καταληπτικὴν φαντασίαν), which to the Stoics is the point of most importance and the concrete truth. Arcesilaus further attacked the Stoics thus: "They themselves say that the conception of thought is the mean between scientific knowledge and opinion, the one of which pertains alone to fools and the other alone to wise men; the conception of thought is common to both, and the criterion of the truth. Arcesilaus here argued in such a way as to show that between scientific knowledge and opinion the conception of thought is no criterion, for it is either in the wise man or the

fool, and in the former it is knowledge, and in the latter, opinion. If it is nothing excepting these, there remains to it nothing but an empty name." For knowledge must be a developed consciousness derived from reasons, but these reasons, as conceptions of thought, Arcesilaus states to be just such thoughts as those of the fool. They are thus, no doubt, the concrete directing power which constitutes the principal content of our consciousness; but it is not proved that they are the truth. Thus this mean, as judging between reason and opinion, pertains equally to the wise man and the fool, and may be error or truth equally; and thus the wise man and the fool have the same criterion, and yet they must, in relation to the truth, be distinguished from one another.

Arcesilaus further gives effect to the distinctions which are more particularly brought up in modern times, and relied upon. "If comprehension is the assent given to a conception of thought, it does not exist. For, in the first place, the assent is not on account of a conception, but of a reason; that is to say, it is only as regards axioms that this assent holds good."[171] That is good; more fully the purport would be something like this: Thought, as subjective, is made to assent to an existence which is a determinate content of the conception. A sensuous image such as this, however, is foreign to thought, and with it thought cannot accord, because it is something different from it, something from which thought, on the contrary, holds itself aloof. It is, in general, only to a thought that thought finds itself conformable, and only in a thought that it finds itself; thus only a universal axiom is capable of such accord, for only such abstract principles are immediately pure thoughts. Arcesilaus thus holds it up against the Stoics that their principle contains a contradiction within itself, because the conception of thought is made to be the thought of another, but thought can only think itself. This is a thought which concerns the inmost essence of the thing. Arcesilaus thus here makes the same celebrated distinction as in

recent times has again been brought forward with so much force as the opposition between thought and Being, ideality and reality, subjective and objective. Things are something different from me. How can I attain to things? Thought is the independent determination of a content as universal; but a given content is individual and hence we cannot assent to such. The one is here, the other there; subjective and objective cannot pass to one another — this is a form of thought upon which for long the whole culture of modern philosophy has turned, and which we still find to-day. It is important to have a consciousness of this difference, and to assert this consciousness against the principle of the Stoics. It was of this unity of thought and reality that the Stoics ought to have given an account; and this they did not do, and indeed it was never done in ancient times. For the ancients did not prove that the subjective element of thought and this objective content are really in their diversity the passing into one another, and that this identity is their truth; this was only found in Plato in an abstract form and as a first commencement. The unity of thought and conception is the difficult matter; thus if thought, as such, is the principle, it is abstract. The logic of the Stoics hence remained formal merely, and the attainment of a content could not be demonstrated. Thought and Being are themselves such abstractions, and we may move to and fro between them for long without arriving at any determination. Thus this unity of universal and particular cannot be the criterion. With the Stoics the conception as comprehended appears to be immediately asserted; it is a concrete, but it is not shown that this is the truth of these distinct elements. Against this immediately accepted concrete, the assertion of the difference of the two is thus quite consistent.

"In the second place," says Arcesilaus, "there is no apprehended conception that is not also false, as has been confirmed many times and oft," just as the Stoics themselves say that the apprehended conception

could be both true and false. Determinate content has its opposite in a determinate which must likewise as an object of thought be true; and this destroys itself. In this consists the blind wandering about in thoughts and reasons such as these, which are not grasped as Idea, as the unity of opposites, but in one of the opposites asserts one thing, and then, with as good reason, the opposite. The truth of the world is, on the contrary, quite different, the universal law of reason which is as such for thought. Reasons are relatively ultimate for a content, but not absolutely ultimate; they can only be regarded as good reasons, as probability, as the Academics express it. This is a great truth which Arcesilaus had attained. But because no unity can thus come forth, he then draws the conclusion that the wise man must withhold his assent, that is, not that he should not think, but that he must not merely for that reason regard as true that which is thought. "For since nothing is comprehensible, he will, if he assents, assent to an incomprehensible; now because such an assent is opinion, the wise man will only be wise in opinion."[172] We still likewise hear this said: Man thinks, but does not thereby arrive at the truth; it remains beyond. Cicero (Acad. Quæst. IV. 24) thus expresses this: "Neither the false nor the true can be known, if the true were simply to be such as is the false."

b. In relation to what is practical, Arcesilaus says: "But since the conduct of life without a criterion of the true or the false is impossible, and the end of life, or happiness, can only be determined through such grounds, the wise man, not withholding his approbation regarding everything, will, as regards what has to be done and left undone, direct his actions in accordance with the probable (εὔλογον)," as the subjectively convincing conception. What is right in this is that the good ground does not extend as far as truth. "Happiness is brought about by discretion (φρόνησις), and rational conduct operates in fitting and right action (κατορθώμασι); that is rightly done which is permitted by a well-grounded justification," so that it appears to be

true. “Thus, he who regards what is well-founded will do rightly and be happy,” but for this culture and intelligent thought are requisite. Arcesilaus thus remains at the indeterminate, at subjectivity of conviction, and a probability justified by good grounds. Thus we see that in regard to what is positive, Arcesilaus does not really get any further than the Stoics, nor say anything different from what they do; only the form is different, because, what the Stoics call true, Arcesilaus calls well-founded or probable. But, on the whole, he possessed a higher kind of knowledge than the Stoics, because what is thus founded cannot be held to have the significance of an implicit existence, but only a relative truth in consciousness.

2. Carneades.

Carneades was equally famous; he was one of the followers of Arcesilaus in the Academy, and he also lived in Athens, though considerably later. He was born in Cyrene in Ol. 141, 3 (217 B.C.), and died in Ol. 162, 4 (132 B.C.), thus being eighty-five years old; though, according to others he was as much as ninety.[173] During the already mentioned (pp. 241, 242) embassy of the three philosophers to Rome, it was chiefly Carneades’ quickness, eloquence, and power of conviction, as also his great fame, which aroused remark, attracted men together, and gained great approbation in Rome. For he here held, after the manner of the Academics, two discourses on justice; the one for and the other against justice. That on which both generally speaking rested, can easily be discovered. In the justification of justice he took the universal as principle; but in showing its nullity, he laid weight on the principle of individuality, of self-interest. To the young Romans who knew little of the opposition in the Notion, this was something new; they had no idea of such methods of applying thought, were much attracted by them, and were soon won over to them. But the older Romans, and particularly the elder Cato, the Censor, who was then still living, saw this

very unwillingly, and declaimed much against it, because the youths were thereby turned away from the strictness of ideas and virtues which prevailed in Rome. As the evil gained ground, Caius Acilius made a proposition in the Senate to banish all philosophers from the city, amongst whom, naturally, without their names being mentioned, those three ambassadors were included. The elder Cato, however, moved the Senate to conclude the business with the ambassadors as quickly as possible, so that they might again set forth, and return to their schools, and might henceforth instruct only the sons of the Greeks. The Roman youths might then as formerly give ear to their laws and magistrates, and learn wisdom from intercourse with the senators.[174] But this taint can no more be avoided than could in Paradise the desire for knowledge. The knowledge which is a necessary moment in the culture of a people, thus makes its appearance as the Fall from innocence, and as corruption. An epoch such as this, in which thought appears to veer about, is then regarded as an evil as far as the security of the ancient constitution is concerned. But this evil of thought cannot be prevented by laws, &c.; it can and must be the healer of itself through itself alone, if thought through thought itself is truly brought to pass.

a. The philosophy of Carneades has been given to us in most detail by Sextus Empiricus; and all else of Carneades that we possess is likewise directed against the dogmatism of the Stoic and Epicurean philosophy. The fact that the nature of consciousness is what is most particularly considered makes his propositions interesting. While in Arcesilaus we still found a good reason or argument maintained, the principle which Carneades supported is expressed as that "in the first place there is absolutely no criterion of the truth, neither feeling, conception, nor thought, nor any other such thing; for all this put together deceives us." This general empirical proposition is still in vogue. In developing the matter further, Carneades proves what he says from reasons, and we have the nature of consciousness

more definitely expressed in the following: "In the second place he shows that even if such a criterion existed, it could not be without an affection (πάθος) of consciousness, which proceeds from perception."[175] For this, speaking generally, is his principal reflection, that every criterion must be constituted so that it has two elements, one being the objective, existent, immediately determined, while the other element is an affection, an activity, an attribute of consciousness, and belongs to the sensitive, conceiving or thinking subject — but as such it could not be the criterion. For this activity of consciousness consists in the fact that it changes the objective, and thus does not allow the objective as it is to come to us immediately. Hence the same attitude of separation is pre-supposed as formerly, viz. that the understanding is to be regarded as an ultimate and clearly absolute relationship.

α. As against the Epicureans, Carneades maintains this: "Because the living is distinguished from the dead through the activity of sensation, by this means it will comprehend itself and what is external. But this sensation which," as Epicurus puts it (*supra*, p. 281), "remains unmoved and is impassive and unchangeable, is neither sensation nor does it comprehend anything. For not until they have been changed and determined by the invasion of the actual does sensation show forth things."[176] The sensation of Epicurus is an existent, but there is in it no principle of judgment, because each sensation is independent. But sensation must be analyzed in accordance with the two points of view there present, for as the soul is therein, determined, so likewise is that which determines determined by the energy of the conscious subject. Because I, as a living being, have sensation, a change in my consciousness takes place, which means that I am determined from without and from within. Consequently the criterion cannot be a simple determinateness, for it is really an implicit relationship in which two moments, sensation and thought, must be distinguished.

β. Since to Carneades sensation is merely what comes first, he then says: “The criterion is thus to be sought for in the affection of the soul by actuality.” For it is only in the mean between the energy of the soul and that of outward things that the criterion can fall. A determinate content of sensation such as this, which is at the same time again determined through consciousness, this passivity and activity of consciousness, this third something, Carneades called the conception which constituted to the Stoics the content of thought. Respecting this criterion, he says: “This being determined must, however, be an indication both of itself and of the apparent, or of the thing through which it is affected; this affection is none other than the conception. Hence in life the conception is something which presents both itself and the other. If we see something, the sight has an affection, and it no longer is just as it was before seeing. Through an alteration such as this there arise in us two things: first change itself, *i.e.* the ordinary conception” (the subjective side) “and then that which change produced, what is seen” (the objective). “Now just as the light shows itself and everything in it, the conception reigns over knowledge in the animal, and it must, like the light, make itself evident, and reveal the actual through which consciousness is affected.” This is quite the correct standpoint for consciousness, and it is in itself comprehensible, but it is only for the phenomenal mind that the other in the determinateness of consciousness is present. We now expect a development of this opposition; but Carneades passes into the region of empiricism without giving this further development. “Since the conception,” he continues, “does not always point to the truth, but often lies, and resembles bad messengers in that it misrepresents what it proceeds from, it follows that not every conception can give a criterion of the truth, but only that which is true, if any are so. But because none is so constituted that it might not also be false, conceptions are likewise a common criterion of the true as of the false, or

they form no criterion." Carneades also appealed to the fact of a conception proceeding even from something not existing, or — if the Stoics asserted that what in the objective is thinkingly apprehended is an existent — to the fact that the false may also be apprehended.[177] In a popular way that is stated thus: There are also conceptions of untruth. Although I am convinced, it is still my conception merely, even if men think they have said something by saying that they have this conviction. They likewise say that insight or objective knowledge is still only the conviction of difference, but really the content is in its nature universal.

γ. Finally, "because no conception is a criterion, neither can thought be taken as such, for this depends on conception" — and must hence be just as uncertain as it is. "For to thought, that respecting which it judges must be conception; but conception cannot exist without unthinking sensation" — this may, however, be either true or false, "so that there is no criterion."[178] This constitutes the principle in the Academic philosophy — that on the one hand the conception is in itself this distinction of thought and existence, and that there is likewise a unity of both, which, however, is no absolutely existing unity. Philosophic culture of those times remained at this standpoint, and in modern times Reinhold also arrived at the same result.

b. Now what Carneades gave expression to of an affirmative nature respecting the criterion, is found in the statement that undoubtedly criteria are to be maintained for the conduct of life and for the acquisition of happiness, but not for the speculative consideration of what is in and for itself. Thus Carneades passes more into what is psychological, and into finite forms of the understanding consciousness; this is consequently no criterion respecting truth, but respecting the subjective habits and customs of the individual, and hence it also is of subjective truth alone, although it still remains a concrete end. "The conception is a conception of something; of that from which it comes as of the externally perceived object, and of the

subject in which it is, *e.g.* of man. In this way it has two relationships — on the one hand to the object, and, on the other, to that which forms the conception. According to the former relationship it is either true or false; true if it harmonizes with what is conceived of, false if this is not so." But this point of view cannot here in any way come under consideration, for the judgment respecting this harmony is most certainly not in a position to separate the matter itself from the matter as conceived. "According to the relationship to that which conceives, the one is conceived (φαινομένε) to be true, but the other is not conceived to be true." Merely this relationship to the conceiver, however, comes under the consideration of the Academicians. "That conceived of as true is called by the Academician appearance (ἔμφασις) and conviction, and convincing conception; but what is not conceived as true is called incongruity (ἀπέμφασις) and non-conviction and non-convincing conception. For neither that which is presented to us through itself as untrue, nor what is true but is not presented to us, convinces us."[179]

Carneades thus determines the leading principle very much as does Arcesilaus, for he recognizes it merely in the form of a "convincing conception;" but as convincing it is "likewise a firm and a developed conception," if it is to be a criterion of life. These distinctions, on the whole, pertain to a correct analysis, and likewise approximately appear in formal logic; they are very much the same stages as are found, according to Wolff, in the clear, distinct, and adequate conception. "We have now shortly to show what is the distinction between these three steps."[180]

α. "A convincing conception (πιθανή) is that which appears to be true and which is sufficiently obvious; it has a certain breadth as well, and may be applied in many ways and in a great variety of cases; ever verifying itself more through repetitions," as in the case of Epicurus, "it makes itself ever more convincing and trustworthy." No further account of its content is

given, but what is so frequently produced is, as empirical universality, made the first criterion.[181] But this is only an individual and, speaking generally, an immediate and quite simple conception.

β. "Because, however, a conception is never for itself alone, but one depends on another as in a chain, the second criterion is added, viz. that it should be both convincing and secure (ἀπερίσπαστος)," *i.e.* connected and determined on all sides, so that it cannot be changed, nor drawn this way and that and made variable by circumstances; and other conceptions do not contradict it, because it is known in this connection with others. This is quite a correct determination, which everywhere appears in the universal. Nothing is seen or said alone, for a number of circumstances stand in connection with it. "For example, in the conception of a man much is contained, both as to what concerns himself and what surrounds him: as to the former, there is colour, size, form, movement, dress, &c.; and in reference to the latter, air, light, friends, and the like. If none of such circumstances make us uncertain or cause us to think the others false, but when all uniformly agree, the conception is the more convincing."[182] Thus when a conception is in harmony with the manifold circumstances in which it stands, it is secure. A cord may be thought to be a snake, but all the circumstances of the same have not been considered. "Thus, as in judging of an illness all the symptoms must be brought under our consideration, so the fixed conception has conviction because all circumstances agree."[183]

γ. "Even more trustworthy than the fixed conception is the conception as developed (διεξωδευμένη), which brings about perfect conviction," the third moment. "While in the case of the fixed conception we only investigate whether the circumstances agree with one another, in the developed conception each one of the circumstances existing in harmony is strictly inquired into on its own account. Thus he who judges as well as what is judged and that according to which judgment is given, are subject to

investigations. Just as in common life in some unimportant matter one witness satisfies us, in one more important several are required, and in a case which is more material still the individual witnesses are themselves examined through a comparison of their testimonies, so in less important matters a general convincing conception satisfies us, in things of a certain importance one which is established, but in those which pertain to a good and happy life one which is investigated in its parts is required."[184] We thus see — in contradistinction to those who place truth in what is immediate, and, especially in recent times, in sensuous perception, in an immediate knowledge, whether as inward revelation or outward perception — that this kind of certainty with Carneades rightly takes the lowest place; the conception worked out and developed really is to him the essential one, and yet it appears in a formal manner only. In fact, the truth is only in thinking knowledge, and if Carneades does not exhaust all that can be said of the nature of this knowledge, he still has rightly emphasized an essential moment in it, the opening out and the judging movements of the moments.

In the New Academy we see the subjective side of conviction expressed, or the belief that not the truth as truth, but its manifestation, or really what it is to the conception, is present in consciousness. Thus only subjective certainty is demanded; of the truth nothing more is said, for only what is relative in respect of consciousness is considered. Just as the Academic principle limited itself to the subjective act of the convincing conception, so likewise did the Stoics really place implicit existence in thought, and Epicurus in perception; but they called this the truth. The Academicians, on the contrary, set it up against the truth, and asserted that it is not the existent as such. They had thus a consciousness that the implicit really has the moment of consciousness in it, and that without this it cannot exist; this was also a fundamental principle to the former, but they were not conscious of it. Though, according to this, the implicit has now an essential relation to

consciousness, this last is still in contrast with the truth; to conscious knowledge, as to the moment of explicitude, the implicit thus still stands in the background, it still confronts it, but at the same time it includes the explicit as an essential moment, even in antagonism to itself; in other words, consciousness is not yet set forth in and for itself. Now, if this Academic standpoint is driven to its ultimate limit, it amounts to this, that everything is clearly for consciousness alone, and that the form of an existent, and of the knowledge of existence, also quite disappears as form; this, however, is Scepticism. Thus if the Academicians still preferred one conviction, one estimate of truth to another, as that in which the aim of a self-existent truth might be said to dwell, or float before their eyes, there still remains this simple belief in the validity of opinion without distinction, or the fact that everything is in like manner only related to consciousness, and is, in fact, phenomenal alone. Thus the Academy had no longer any fixed subsistence, but hereby really passed into Scepticism, which merely asserted a subjective belief in truth, so that all objective truth has really been denied.

D. Scepticism.

SCEPTICISM COMPLETED THE theory of the subjectivity of all knowledge by the fact that in knowledge it universally substituted for Being the expression *appearance*. Now this Scepticism undoubtedly appears to be something most impressive, to which great respect is due from man. In all times as now, it has been held to be the most formidable, and, indeed, the invincible opponent of Philosophy, because it signifies the art of dissolving all that is determinate, and showing it in its nullity. Thus it might almost appear as though it were held to be in itself invincible, and as though the only difference in convictions were whether the individual decided for it or for a positive, dogmatic philosophy. Its result undoubtedly is the disintegration of the truth, and, consequently, of all content, and thus perfect negation. The invincibility of Scepticism must undoubtedly be granted, only, however, in a subjective sense as regards the individual, who may keep to the point of view of taking no notice of Philosophy, and only asserting the negative. Scepticism in this way seems to be something to which men give themselves over, and we have the impression that we are not able to get within reach of anyone who thus throws himself entirely into Scepticism; another man, however, simply rests content with his philosophy, because he takes no notice of Scepticism, and this is really what he ought to do, for, properly speaking, it cannot be refuted. Certainly if we were merely to escape from it, it would not in reality have been defeated, for on its side it would remain where it was, and in possession of the field. For positive philosophy allows Scepticism to exist beside it; Scepticism, on the other hand, encroaches upon the domain of positive philosophy, for Scepticism has power to overcome the other, while positive philosophy

cannot do the same to it. If anyone actually desires to be a Sceptic, he cannot be convinced, or be brought to a positive philosophy,[185] any more than he who is paralyzed in all his limbs can be made to stand. Scepticism is, in fact, such paralysis — an incapacity for truth which can only reach certainty of self, and not of the universal, remaining merely in the negative, and in individual self-consciousness. To keep oneself in individuality depends on the will of the individual; no one can prevent a man from doing this, because no one can possibly drive another out of nothing. But thinking Scepticism is quite different; it is the demonstration that all that is determinate and finite is unstable. As to this, positive philosophy may have the consciousness that it has the negation to Scepticism in itself; thus it does not oppose it, nor is it outside of it, for Scepticism is a moment in it. But this is true in such a way that this philosophy comprehends in itself the negative in its truth, as it is not present in Scepticism.

The relation of Scepticism to Philosophy is further this, that the former is the dialectic of all that is determinate. The finitude of all conceptions of truth can be shown, for they contain in themselves a negation, and consequently a contradiction. The ordinary universal and infinite is not exalted over this, for the universal which confronts the particular, the indeterminate which opposes the determinate, the infinite which confronts the finite, each form only the one side, and, as such, are only a determinate. Scepticism is similarly directed against the thought of the ordinary understanding which makes determinate differences appear to be ultimate and existent. But the logical Notion is itself this dialectic of Scepticism, for this negativity which is characteristic of Scepticism likewise belongs to the true knowledge of the Idea. The only difference is that the sceptics remain at the result as negative, saying, “This and this has an internal contradiction, it thus disintegrates itself, and consequently does not exist.” But this result as merely negative is itself again a one-sided determinateness opposed to

the positive; *i.e.* Scepticism only holds its place as abstract understanding. It makes the mistake of thinking that this negation is likewise a determinate affirmative content in itself; for it is, as the negation of negation, the self-relating negativity or infinite affirmation. This, put quite abstractly, is the relation of Philosophy to Scepticism. The Idea, as abstract Idea, is the quiescent and inert; it only is in truth in as far as it grasps itself as living. This occurs because it is implicitly dialectic, in order to abrogate that inert quiescence, and to change itself. But if the philosophic Idea is thus implicitly dialectic, it is not so in a contingent manner. Scepticism, on the contrary, exercises its dialectic contingently, for just as the material comes up before it, it shows in the same that implicitly it is negative.

The older Scepticism must further be distinguished from the modern, and it is only with the former that we have to do, for it alone is of a true, profound nature; the modern more resembles Epicureanism. Thus Schulze of Göttingen has in recent times boasted of his Scepticism; he wrote an "Ænesidemus" in order thus to compare himself with that sceptic; and in other works, too, he put forward Scepticism in opposition to Leibnitz and to Kant. Nevertheless, he ignores entirely the true position of Scepticism as it has just been described, and instead of representing the true distinction which exists between his Scepticism and the ancient, Schulze recognizes nothing but Dogmatism and Scepticism, and not the third philosophy at all. Schulze and others make it fundamental that we must consider sensuous Being, what is given to us by sensuous consciousness, to be true; all else must be doubted. What we think is ultimate, the facts of consciousness. The older sceptics, indeed, allowed that men must direct their actions in accordance with this last, but to assert it to be the truth did not occur to them. Modern Scepticism is only directed against thought, against the Notion and the Idea, and thus against what is in a higher sense philosophic; it consequently leaves the reality of things quite unquestioned, and merely

asserts that from it nothing can be argued as regards thought. But that is not even a peasants' philosophy, for they know that all earthly things are transient, and that thus their Being is as good as their non-being. Modern Scepticism is the subjectivity and vanity of consciousness, which is undoubtedly invincible, not, however, to science and truth, but merely to itself, this subjectivity. For it goes no further than saying, "This is held by me to be true, my feeling, my heart is ultimate to me." But here certainty is alone in question, and not truth; and, indeed, this nowadays is no longer called Scepticism. But the conviction of this individual subject expresses nothing at all, however high the matter which we talk of is supposed to be. Thus because on the one hand it is said that the truth is merely the conviction of another, and on the other hand personal conviction, which is also a 'merely,' is set on high, we must leave this subject alone, first on account of its high pretensions, and then on account of its lowliness. The result of the older Scepticism is indeed the subjectivity of knowledge only, but this is founded on an elaborately thought out annihilation of everything which is held to be true and existent, so that everything is made transient.

According to this, the function of Scepticism is wrongly termed the inculcation of proneness to doubt; nor can we translate σκέψις by Doubt, if Scepticism was also called by Sextus (Pyrrh. Hyp. I. 3, § 7) ephectic (ἐφεκτική) because one of its chief points was that judgment must be suspended. Doubt, however, is only uncertainty, irresolution, indecision, the thought which is opposed to something held to be valid. Doubt proceeds from the fact of there being two; it is a passing to and fro between two or more points of view, so that we neither rest at the one nor the other — and yet we ought to remain at one point or another. Thus doubt in man is quite likely to involve a rending asunder of mind and spirit; it gives unrest and brings unhappiness with it; doubts, for instance, arise respecting the immortality of the soul and the existence of God. Forty years ago,[186] much

was written about this; in poetry, too, we found the situation of the doubter was a subject of the greatest interest, the unhappiness of doubt being depicted to us as in the "Messias." This supposes a deep interest in a content, and the desire of the mind that this content should either be established in it or not, because it desires to find its rest either in the one or the other. Such doubt is said to betoken a keen and sharp-witted thinker, but it is only vanity and simple verbiage, or a feebleness that can never arrive at anything. This Scepticism has nowadays entered into our life, and it thus makes itself of account as this universal negativity. But the older Scepticism does not doubt, being certain of untruth, and indifferent to the one as to the other; it does not only flit to and fro with thoughts that leave the possibility that something may still be true, but it proves with certainty the untruth of all. Or its doubt to it is certainty which has not the intention of attaining to truth, nor does it leave this matter undecided, for it is completely at a point, and perfectly decided, although this decision is not truth to it. This certainty of itself thus has as result the rest and security of the mind in itself, which is not touched with any grief, and of which doubt is the direct opposite. This is the standpoint of the imperturbability of Scepticism.

Now what has to be considered even before treating of Scepticism itself, is its external history. As regards the origin of Scepticism the Sceptics say that it is very old, that is, if we take it in the quite indeterminate and universal sense, in so far as to say "Things are, but their Being is not true, for it likewise involves their non-being; or they are changeable. For example, this day is to-day, but to-morrow is also to-day, &c.; it is day now but night is also now, &c." Thus of what in this way is allowed to be a determinate, the opposite is also expressed. Now if it be said that all things are transient, things may in the first place be changed; however this is not only possible, but the fact that all things are transient really means when taken in its universality:— "Nothing exists in itself, for its reality is the

abrogation of self, because things in themselves, in accordance with their necessity, are transient. Only now are they thus; at another time they are different, and this time, the now, is itself no more while I am speaking of it; for time is not itself fixed, and it makes nothing fixed.” This uncertainty in what is sensuous represents a long-standing belief amongst the unphilosophic public as well as amongst philosophers up to this time; and this negativity in all determinations likewise constitutes the characteristic feature of Scepticism. The Sceptics have also presented this position in an historic way, and they show that even Homer was a sceptic, because he speaks of the same things in opposite ways. They also count in this category Bias, with his maxim “Pledge thyself never.” For this has the general sense “Do not consider anything to be anything, do not attach yourself to any object to which you devote yourself, do not believe in the security of any relationship, &c.” Likewise the negative aspect of the philosophy of Zeno and Xenophanes is said to be sceptical, and further, Heraclitus, too, with his principle that everything flows, that everything is consequently contradictory and transient; finally Plato and the Academy are sceptical, only here Scepticism is not yet quite clearly expressed.[187] All this may be taken as being in part the sceptical uncertainty of everything; but that is not its real meaning. It is not this conscious and universal negativity; as conscious, it must prove, as universal, it must extend the untruth of the objective to everything; thus it is not a negativity which says definitely that everything is not implicit but is only for self-consciousness, and everything merely goes back into the certainty of itself. As philosophic consciousness Scepticism is consequently of later date. By Scepticism we must understand a specially constituted consciousness for which in some measure not only sensuous Being, but also Being for thought does not hold true, and which can then with consciousness account for the nullity of that which is asserted to be reality; and finally, in a general way, it not only annuls this and that

sensuous fact or thought, but is adapted for the recognition in everything of its untruth.

The history of Scepticism, properly so called, is usually commenced with Pyrrho as being its founder; and from him the names Pyrrhonism and Pyrrhonic are derived. Sextus Empiricus (Pyrrh. Hyp. I. c. 3, § 7) says of him "that he went into Scepticism more fully (σωματικώτερον) and clearly than did his predecessors." He is earlier than some of the philosophers already considered; but because Scepticism is to be taken as a whole, Pyrrho's Scepticism, even if it is merely aimed against the immediate truth both of the senses and of morality, must be taken along with the later Scepticism, which directs its attention rather against the truth as thought, as will be farther shown on a closer consideration; for this last was the first, properly speaking, to make a sensation. As to the events of Pyrrho's life, they appear to be as much a matter of doubt as his doctrine; for they are without any connection, and little is known for certain concerning them. Pyrrho lived in the time of Aristotle and was born at Elis. I shall not give the names of his instructors; Anaxarchus, a disciple of Democritus, is specially mentioned amongst them. We cannot discover where he really lived, for the most part at least. As a proof of how very much he was esteemed during his life, it is said that his native town chose him as head priest, and the town of Athens gave him the right of citizenship. It is finally stated that he accompanied Alexander the Great in his journey to Asia; and that there he had considerable dealings with magicians and Brahmins. We are told that Alexander had him put to death because he desired the death of a Persian satrap; and this fate befel him in his ninetieth year. If all this is to be accepted, since Alexander spent between twelve and fourteen years in Asia, Pyrrho must at the earliest have set out on his travels in his seventy-eighth year. Pyrrho does not appear to have come forward as a public teacher, but merely to have left behind him individual friends who had been

educated by him. Anecdotes are told, not so much about the circumstances of his life as about the sceptical manner in which he conducted himself, and in them his behaviour is made to look ridiculous; in this the universal of Scepticism is set against a particular case, so that what is absurd shoots up as of itself into relationships which appear to be consistent. For because he asserted that the reality of sensuous things has no truth, it is, for instance, said that were he walking he would go out of the way of no object, no waggon or horse that came towards him; or he would go straight up against a wall, completely disbelieving in the reality of sensuous sensations and such like. They also said that it was only the friends surrounding him who drew him away from such dangers and saved him.[188] But such anecdotes are evidently extravagant, because, for one thing, it is not conceivable that he could have followed Alexander to Asia at ninety years of age. It is also very clear that such stories are simply invented with the object of ridiculing the sceptical philosophy, by following out its principle to such extreme consequences. To the Sceptics sensuous existence undoubtedly holds good as phenomenal in so far as the regulation of ordinary conduct is concerned (*infra*, p. 343), but not in as far as it is held to be the truth; for even the followers of the New Academy said that men must not only direct their lives in accordance with rules of prudence, but also in accordance with the laws of sensuous manifestation (*supra*, pp. 319, 324).

After Pyrrho, Timon of Phliasis, the sillographist, became specially famous.[189] Of his Silli, *i.e.* biting remarks respecting all philosophies, many are quoted by the ancients; they are certainly bitter and disdainful enough, but many of them are not very witty or worthy of being preserved. Dr. Paul collected them in an essay, but in it much is given that is meaningless. Goethe and Schiller certainly show more capacity in works of a similar nature. The Pyrrhonians hereupon disappear, — they seem in general only to have shown themselves in a more or less isolated way; for a long time

after this we read in history of the Peripatetics, Stoics and Epicureans being confronted only by the Academicians and perhaps some of the older Sceptics who are mentioned likewise.

Ænesidemus was the first to reawaken Scepticism; he was of Cnossus in Crete, and lived in Cicero's time in Alexandria,[190] which soon began to compete with Athens for the honour of being the seat of Philosophy and the sciences. Subsequently, when the Academy lost itself in Scepticism, we see the latter, from which the former is all the same only separated by a thin partition, taking up a position of predominance as representing the purely negative point of view. But a scepticism such as that of Pyrrho, which does not as yet show much culture or tendency towards thought, but which is directed only against what is sensuous, could have no interest in the culture of Philosophy as it is found in Stoicism, Epicureanism, Platonism, &c. Thus it is requisite, in order that Scepticism should appear with the dignity pertaining to Philosophy, that it should itself be developed on its philosophic side; and this was first done by Ænesidemus.

However, one of the most celebrated of the Sceptics, whose works we still in great measure possess, and who for us is by far the most important writer upon Scepticism, because he gives us detailed accounts of this philosophy, is Sextus Empiricus, of whose life unfortunately as good as nothing is known. He was a physician, and that he was an empirical physician, who did not act according to theory but in accordance with what appears, his name tells us. He lived and taught about the middle of the second century after Christ.[191] His works are divided into two parts: first, his *Pyrrhoniæ Hypotyposes*, in three books, which give us somewhat of a general presentation of Scepticism, and secondly his books *adversus Mathematicos*, *i.e.* against scientific knowledge generally, and more especially against the geometricians, arithmeticians, grammarians,

musicians, logicians, physicists, and moral philosophers. There were in all eleven books, six of which are actually directed against mathematicians, but the other five against the philosophers.

The distinction between the Academy and Scepticism was a matter as to which the Sceptics exercised themselves much. The New Academy really bordered so closely upon Scepticism, that the Sceptics had enough to do to dissociate themselves from it, and in the Sceptic school a long and important battle raged as to whether Plato, and subsequently the New Academy, belonged to Scepticism or not;[192] in the course of this we also see that Sextus did not really know what to make of Plato. The Sceptics are, on the whole, very careful to distinguish their own from other systems. Sextus (Pyrrh. Hyp. I. c. 1, §§ 1-4) distinguishes three philosophies: “He who seeks an object must either find it or deny that it can be found, or persevere in the search. Now the same holds good with philosophic investigations; some assert that they have found the truth; others deny that it can be grasped; a third set are still engaged in search. The first, like Aristotle, Epicurus, the Stoics, and others, are the so-called Dogmatists; those who assert incomprehensibility are the Academicians; the Sceptics still continue to seek. Hence there are three philosophies: the Dogmatic, the Academic and the Sceptical.” For this reason, the Sceptics called themselves the seekers (ζητητικοί), and their philosophy the seeking (ζητητική).[193] However, the distinction between Scepticism and the New Academy rests in the form of expression only, and is thus not a great one: indeed it is founded only on the mania of the Sceptics to cut off and to shun any sort of assertive statement. Sextus (Pyrrh. Hyp. I. c. 7, § 13; c 10, §§ 19-20) says: “The Sceptic does not dogmatize, but only assents to the affections into which he is impelled, not of his own will, by the conceptions; thus, if for example, he is warm or cold, he will certainly not say, I seem not to be cold or warm. But if it be asked if the subject is as it appears, we allow appearance (φαίνεσθαι); yet

we do not investigate the thing that appears, but only the predicate predicate (ὃ λέγεται)[194] expressing its appearance. Thus, whether anything is sweet or not, we consider only as regards the Notion Notion (ὅσον ἐπὶ τῷ λόγῳ); but that is not what appears, but what is said of what appears. But if we institute direct investigations respecting what appears, we do so not in order to destroy what appears, but in order to condemn the rashness (προπέτειαν) of the dogmatists." Thus the Sceptics endeavour to bring about the result that in what they say no expression of a Being can be demonstrated, so that, for example, in a proposition, they always set appearance in the place of existence. According to Sextus they say (Pyrrh. Hyp. I. c. 7, § 14; c. 28, § 206): "The Sceptic makes use of his propositions — for example, determine nothing (οὐδὲν ὁρίζειν), not the more (οὐδὲν μᾶλλον), nothing is true, &c. — not as if they really did exist. For he believes, for instance, that the proposition, everything is false, asserts that itself as well as the others is false, and consequently limits it (συμπεριγράφει). Thus we must similarly in all sceptical propositions recollect that we do not at all assert their truth; for we say that they may destroy themselves, since that limits them of which they are predicated." Now, the New Academy of Carneades does not express anything as being the true and existent, or as anything to which thought could agree; the Sceptics thus come very near to the Academy. Pure Scepticism merely makes this objection to the Academy, that it is still impure. Sextus says (Pyrrh. Hyp. I. c. 33, §§ 226-233): "But clearly they differ from us in the judgment of good and evil. For they assert that something is good or evil," that is to say, the former is the withholding of assent, and the latter the granting of it (*supra*, p. 315), "whereby they are convinced of its being probable that what of good is attributed to the predicate, is more likely to be good than the opposite." Thus they have not elevated themselves to the purity of Scepticism, because they speak of *existence*, and not of *appearance*. But this is nothing more than a mere

form, for the content immediately destroys that which in form appears to be an assertion. If we say: “Something is a good, thought assents to it,” and then ask, “But what is the good to which thought assents?” the content here is that it should not assent. Hence the form is, “It is a good,” but the content is that nothing should be held to be good or true. Thus the Sceptics also assert this: To the Sceptics “all conceptions are alike in trustworthiness or untrustworthiness in relation to the ground,” to truth. “But the Academicians say that some are probable, and others improbable, and amongst the probable, some again are to be preferred to the others.” Preference is thus one of the forms which the Sceptics also object to (*infra*, p. 345); for such expressions strike them as still too positive.

Now, speaking generally, the essential nature of Scepticism consists in its considering that to self-consciousness on its own account, there proceeds from the disappearance of all that is objective, all that is held to be true, existent or universal, all that is definite, all that is affirmative, through the withholding of assent, the immovability and security of mind, this imperturbability in itself. Hence the same result is obtained, that we have already seen in systems of philosophy immediately preceding this. Thus as soon as anything is held to be truth to self-consciousness, we find the result that to self-consciousness this truth is the universal reality, passing beyond itself, and in regard to this, self-consciousness esteems itself as nothing. But this external and determinate truth, as finite, is not implicitly existent, so that its necessity is to vacillate and give way. Then when this security disappears, self-consciousness itself loses its equilibrium, and becomes driven hither and thither in unrest, fear and anguish; for its stability and rest is the permanence of its existence and truth. But sceptical self-consciousness is just this subjective liberation from all the truth of objective Being, and from the placing of its existence in anything of the kind; Scepticism thus makes its end the doing away with the unconscious

servitude in which the natural self-consciousness is confined, the returning into its simplicity, and, in so far as thought establishes itself in a content, the curing it of having a content such as this established in thought. “The effective principle of Scepticism,” Sextus hence tells us (Pyrrh. Hyp. I. c. 6, § 12, c. 12, §§ 25-30), “is the hope of attaining to security. Men of distinguished excellence, disquieted through the instability of things, and dubious as to which should in preference be given assent to, began the investigation of what is the truth and what false in things, as if they could reach imperturbability through the decision of such matters. But while engaged in this investigation, man attains the knowledge that opposite determinations,” desires, customs, &c., “have equal power,” and thus resolve themselves; “since in this way he cannot decide between them, he really only then attains to imperturbability when he withholds his judgment. For if he holds anything to be good or evil by nature, he never is at rest, whether it be that he does not possess what he holds to be good, or that he thinks himself vexed and assailed by natural evil. But he who is undecided respecting that which is good and beautiful in nature, neither shuns nor seeks anything with zeal; and thus he remains unmoved. What happened to the painter Apelles, befalls the Sceptic. For it is told that when he was painting a horse, and was altogether unsuccessful in rendering the foam, he finally in anger threw the sponge on which he had wiped his brushes, and in which every colour was therefore mixed, against the picture, and thereby formed a true representation of foam.” Thus, the Sceptics find in the mingling of all that exists, and of all thoughts, the simple self-identity of self-consciousness which “follows mind as the shadow does the body,” and is only acquired, and can only be acquired through reason. “Hence we say that the end of the Sceptic is imperturbability in the conceptions and moderation in the affections which he is compelled to have.” This is the indifference which the animals have by nature, and the possession of which

through reason distinguishes men from animals. Thus, Pyrrho once showed to his fellow-passengers on board a ship, who were afraid during a storm, a pig, which remained quite indifferent and peacefully ate on, saying to them: in such indifference the wise man must also abide.[195] However the indifference must not be like that of the pig, but must be born of reason. But if to Scepticism existence was only a manifestation or conception, it was yet esteemed by it as that in respect to which the Sceptics directed their conduct, both in what they did, and what they left undone. The above-quoted (p. 336) anecdotes about Pyrrho are thus opposed to what the Sceptics themselves said on the subject: "We undoubtedly direct our conduct in accordance with a reason which, in conformity with sensuous phenomena, teaches us to live conformably to the customs and laws of our country, and in consonance with recognized institutions and personal affections."[196] But for them this had only the significance of a subjective certainty and conviction, and not the value of an absolute truth.

Thus the universal method of Scepticism was, as Sextus Empiricus puts it (Pyrrh. Hyp. I. c. 4, §§ 8-10; c. 6, § 12): "a power of in some way or other setting what is felt, and what is thought, in opposition, whether it be the sensuous to the sensuous, and what is thought to what is thought, or what is sensuous to what is thought, or what is thought to what is sensuous, *i.e.* showing that any one of these has as much force and weight as its opposite, and is hence equivalent as far as conviction and non-conviction are concerned. From this the suspension of judgment (ἐποχή) results, in conformity with which we select and posit nothing, and thereby complete freedom from all mental emotion is attained. The principle of Scepticism is thus found in the proposition that each reason is confronted by another, which holds equally good. We do not, however, necessarily accept affirmation and negation as opposite grounds, but merely those that conflict with one another." That which is felt is really existence for sensuous

certainty, which simply accepts it as truth; or it is that which is felt in the Epicurean form, which consciously asserts it to be true. What is thought is in the Stoic form a determinate Notion, a content in a simple form of thought; both these classes, immediate consciousness and thinking consciousness, comprehend everything which is in any way to be set in opposition. In as far as Scepticism limits itself to this, it is a moment in Philosophy itself, which last, having an attitude of negativity in relation to both, only recognizes them as true in their abrogation. But Scepticism thinks that it reaches further; it sets up a pretension of venturing against the speculative Idea and conquering it; Philosophy, however, since Scepticism itself is present in it as a moment, rather overcomes it (*supra*, p. 330). As far as what is sensuous and what is thought in their separation are concerned, it certainly may conquer, but the Idea is neither the one nor the other, and it does not touch on the rational at all. The perpetual misunderstanding which those who do not know the nature of the Idea are under concerning Scepticism, is that they think that the truth necessarily falls into the one form or the other, and is thus either a determinate Notion or a determinate Being. Against the Notion as Notion, *i.e.* against the absolute Notion, Scepticism does not in any way proceed; the absolute Notion is rather its weapon of defence, though Scepticism has no consciousness of this. We shall on the one hand see Scepticism use that weapon against the finite, and on the other, how it tries its skill upon the rational.

But though, according to this, Scepticism always expresses itself as if everything were in appearance only, the Sceptics go further than those who support the newer and purely formal idealism. For they deal with content, and demonstrate of all content that it is either experienced by the senses or thought, and consequently that it has something in opposition to it. Thus they show in the same thing the contradiction that exists, so that of

everything that is presented the opposite also holds good. This is the objective element in Scepticism in its manifestation, and that through which it is not subjective idealism. Sextus (Pyrrh. Hyp. I. c. 13, §§ 32, 33) says: "Thus, for instance, the sensuous is set against the sensuous by our being reminded of the fact that the same tower when looked at near is square and when regarded in the distance looks round;" and hence the one assertion is as good as the other. This, indeed, is a very trivial example, but its interest lies in the thought that is present in it. "Or what is thought is set in opposition to what is thought. As to the fact that there is a providence," which rewards the good and punishes the evil, "men appeal," as against those who deny it, "to the system of the heavenly bodies; to this it is objected that the good often fare badly and the evil well, from which we demonstrate that there is no providence." As to the "opposition of what is thought to the sensuous," Sextus adduces the conclusion of Anaxagoras, who asserts of the snow, that although it appears to be white, regarded in relation to the reasons given by reflection it is black. For it is frozen water, but water has no colour and hence is black; consequently snow must be the same.

We must now consider further the method in which the Sceptics proceed, and it consists in this, that they have brought the universal principle that each definite assertion has to be set over against its 'other,' into certain forms, not propositions. Thus, in view of the nature of Scepticism, we cannot ask for any system of propositions, nor will this philosophy really be a system; just as little did it lie in the spirit of Scepticism to form a school, properly speaking, but only an external connection in the wider sense of the word. Sextus (Pyrrh. Hyp. I. c. 8, § 16, c. 3, § 7) hence says that Scepticism is no selection (αἵρεσις) of dogmas, it is not a preference for certain propositions, but only that which leads, or rather which directs us (ἀγωγή) to live rightly and think correctly; thus it is in this way rather a method or

manner by which only universal modes of that opposition are shown. Now since what sort of thoughts reveal themselves is a matter of contingency, the manner and mode of grasping them is contingent likewise; for in one the contradiction appears thus and in another otherwise. These determinate modes of opposition, whereby the withholding of assent comes to pass, the Sceptics called tropes (τρόποι), which are turned upon everything that is thought and felt in order to show that this is not what it is implicitly, but only in relation to another — that it thus itself appears in another, and allows this other to appear in it, and consequently that, speaking generally, what is, only seems; and this, indeed, follows directly from the matter in itself, and not from another which is assumed as true. If, for example, men say that empiric science has no truth because truth exists only in reason, this is only assuming the opposite of empiricism; likewise the truth of reason proved in itself is not a refutation of empiric science, for this last stands alongside of the former with equal rights as, and within the same.

Now since the sceptical doctrine consists in the art of demonstrating contradictions through these *tropes*, we only require to elucidate these modes. The Sceptics themselves, like Sextus, for example (Pyrrh. Hyp. I. c. 14, 15) distinguish in these forms the earlier and the later: ten of them belong to the elder Sceptics, that is to say to Pyrrho, and five were afterwards added by the later Sceptics, and Diogenes Laertius indeed tells us (IX. 88) that this was first done by Agrippa. From a specification of these it will be shown that the earlier are directed against the ordinary consciousness generally and belong to a thought of little culture, to a consciousness which has sensuous existence immediately before it. For they proceed against what we call common belief in the immediate truth of things, and refute it in a manner which is immediate likewise, not through the Notion but through the existence which is opposed to it. In their enumeration, too, there is this same absence of the Notion. But the five

others appear to be better, have more interest, and are manifestly of later origin; they proceed against reflection, *i.e.* against a consciousness which relates itself to the developed understanding, and thus specially against thought-forms, scientific categories, the thought of the sensuous, and the determination of the same through Notions. Now though the most part of these may appear to us to be quite trivial, we must still be indulgent towards them, for they are historically, and consequently really, directed against the form "it is." But without doubt it is a very abstract consciousness that makes this abstract form "it is" its object and combats it. However trivial then and commonplace these tropes may always appear to be, even more trivial and commonplace is the reality of the so-called external objects, that is, immediate knowledge, as when, for instance, I say "This is yellow." Men ought not to talk about philosophy, if in this innocent way they assert the reality of such determinations. But this Scepticism was really far from holding things of immediate certainty to be true; thus it actually stands in contrast to modern Scepticism, in which it is believed that what is in our immediate consciousness, or indeed, all that is sensuous, is a truth (*supra*, pp. 331, 332). As distinguished from this, the older Scepticism, the modes of which we would now consider further, is directed against the reality of things.

1. The Earlier Tropes.

In the earlier tropes we see the lack of abstraction appearing as the incapacity to grasp their diversitude under more simple general points of view, although they all, in fact, partly under a simple conception and partly in their difference, do in fact converge into some necessary simple determinations. From all alike, in relation to immediate knowledge, is the insecurity demonstrated of that of which we say "it is." Sextus Empiricus (Pyrrh. Hyp. I. c. 14, § 38) even remarks, that "all the tropes may be

summed up in three: the one is the judging subject; the other that respecting which the judgment is made; the third that which contains both sides" — the relation of subject and object. If thought is developed further, it embraces things in these more general determinations.

a. "The first trope is the diversitude in animal organization, according to which different living beings experience different conceptions and sensations respecting the same object. This the Sceptics conclude from the different nature of their origin, because some are brought into being through copulation and others without copulation" (from a *generatio æquivoca*): "but of the first some are hatched from eggs, and others come immediately living into the world, &c. Thus it is a matter of no doubt that this difference of origin produces opposite constitutions, temperaments, &c. The variety in the parts of the body, and particularly in those which are given to the animal for purposes of distinguishing and feeling, thus produces in them the greatest differences in conceptions. For instance, the jaundiced patient sees as yellow what to others appears white," and as green, what to the latter seems blue. "Similarly the eyes of animals are differently constructed in different species, and have different colours, being pale, grey or red; consequently what is perceived thereby must be different."[197]

This difference in the subject undoubtedly establishes a difference in perception, and this last a difference between the conception and the nature of the object of perception. But if we say "That is," we mean something fixed, maintaining itself under all conditions; whereas in opposition to this the Sceptics show that everything is variable. But if they thereby destroy similarity and identity for the senses, and consequently *this* universality, another steps in, for universality or existence rests simply in the fact of men knowing that, in the hackneyed example of the jaundiced man, things appear so to him, *i.e.* the necessary law is known whereby a change of sensation arises for him. But certainly it is implied in this that the first

sensuous universality is not true universality, because it is one immediate and unknown; and in it as sensuous existence, its non-universality is rightly demonstrated within itself through another universality. As against the statement “This is blue because I see it as such,” which clearly makes sight the ground of its being asserted to be blue, it is quite fair to point to another who has immediate perception of the object and for whom it is not blue.

b. The second trope, the diversitude of mankind in reference to feelings and conditions, amounts very much to the same thing as in the first case. In respect to difference in constitution of body, the Sceptics discover many idiosyncrasies. As regards the proposition “Shade is cool,” for instance, they say that someone felt cold in the sunlight, but warm in shadow; as against the statement “Hemlock is poisonous,” they instance an old woman in Attica who could swallow a large dose of hemlock without harm — thus the predicate poisonous is not objective, because it suits the one and not the other. Because such great bodily differences are present amongst men, and the body is the image of the soul, men must have a diversity of mind likewise and give the most contradictory judgments, so that no one can know whom to believe. To judge by the greater number would be foolish, for all men cannot be inquired of.[198] This trope again relates to the immediate; if, therefore, what has to be done is merely to believe some statement inasmuch as it is made by others, undoubtedly nothing but contradiction takes place. But a belief like this, that is ready to believe anything, is, as a matter of fact, incapable of understanding what is said; it is an immediate acceptance of an immediate proposition. For it did not demand the reason; but the reason is, in the first place, the mediation and the meaning of the words of the immediate proposition. Diversitude in men is really something which now likewise appears in other forms. It is said that men differ in regard to taste, religion, &c.; that religion must be left for each to decide for himself; that each, from a standpoint of his own, must

settle how things are to be regarded as far as religion is concerned. The consequence of this is that in regard to religion there is nothing objective or true, everything ends in subjectivity, and the result is indifference to all truth. For then there is no longer a church; each man has a church and a liturgy of his own, each has his own religion. The Sceptics more particularly — as those who in all times spare themselves the trouble of philosophizing, on some sort of pretext, and who try to justify this evasion — persistently preach the diversity of philosophies; Sextus Empiricus does this very expressly, and it may even be brought forward here, although it will appear more definitely as the first of the later tropes. If the principle of the Stoics, as it is in its immediacy, holds good, the opposite principle, that of the Epicureans, has just as much truth, and holds equally good. In this way, when it is said that some particular philosophy asserts and maintains certain propositions, the greatest diversity is undoubtedly to be found. For here we have the talk which we censured earlier (Vol. I. p. 16): "Since the greatest men of all times have thought so differently and have not been able to come to an agreement, it would be presumptuous on our part to believe we had found what they could not attain to," and with those who speak thus, the timid shrinking from knowledge makes out the inertness of their reason to be a virtue. Now if the diversity cannot be denied, because it is a fact that the philosophies of Thales, Plato, and Aristotle were different, and that this was not merely apparently the case, but that they contradicted one another, this way of wishing in such statements of them to gain a knowledge of the philosophies, shows a want of understanding as regards Philosophy; for such propositions are not Philosophy, nor do they give expression to it. Philosophy is quite the reverse of this immediacy of a proposition, because in that the very knowledge that is essential is not taken into account; hence such men see everything in a philosophy excepting Philosophy itself, and this is overlooked. However different the philosophic systems may be, they

are not as different as white and sweet, green and rough; for they agree in the fact that they are philosophies, and this is what is overlooked. But as regards the difference in philosophies, we must likewise remark upon this immediate validity accorded to them, and upon the form, that the essence of Philosophy is expressed in an immediate manner. As regards this ‘is’ the trope undoubtedly does its work, for all tropes proceed against the ’is,’ but the truth is all the time not this dry ’is,’ but genuine process. The relative difference in philosophies is, in their mutual attitude towards one another (see the fifth trope), always to be comprehended as a connection, and therefore not as an ’is.’

c. The third trope turns on the difference in the constitution of the organs of sense as related to one another; *e.g.* in a picture something appears raised to the eye but not to the touch, to which it is smooth, &c.[199] This is, properly speaking, a subordinate trope, for in fact a determination such as this coming through some sense, does not constitute the truth of the thing, what it is in itself. The consciousness is required that the unthinking description which ascribes existence to blue, square, &c., one after the other, does not exhaust and express the Being of the thing; they are only predicates which do not express the thing as subject. It is always important to keep in mind that the different senses grasp the same thing in contradictory ways, for by this the nullity of sensuous certainty is revealed.

d. The fourth trope deals with the diversitude of circumstances in the subject, in reference to its condition, the changes taking place in it, which must prevent our making an assertion respecting any particular thing. The same thing manifests itself differently to the same man, according as he, for instance, is at rest or moving, asleep or awake, moved by hatred or love, sober or drunk, young or old, &c. In the diversitude of these circumstances very different judgments are passed regarding one and the same object, hence we must not talk of anything as being more than a manifestation.[200]

e. The fifth trope relates to the different positions, distances and places, for from every different standpoint the object appears to be different. In respect to position, a long passage appears to the man who stands at the one end to taper to a point at the other; but if he goes there he finds it to be of the same breadth at that end as it was at the other. Distance is likewise, properly speaking, a difference in the greatness and smallness of objects. In respect to place, the light in a lantern is quite feeble in the sunshine, and yet in darkness it shines quite brightly. Pigeons' necks, regarded from different points of view, shimmer quite differently.[201] In regard to motion in particular very different views prevail. The best known example of such is found in the course of the sun round the earth, or the earth round the sun. As the earth is said to go round the sun, even though the opposite appears to be the case, the former assertion is based on reasons. This example does not, however, come in here, but this trope will show that because one sensuous feeling contradicts another, existence is not expressed in it.

f. The sixth trope is taken from intermixture, because nothing comes within the scope of the sense alone and isolated, but only as mingled with something else; this admixture with something else, however, causes change, just as scents are stronger in the sunshine than in cold air, &c. Further, through the subject himself, this admixture comes in; the eyes consist of various tunics and humours, the ear has different passages, &c., consequently they cannot allow sensations — the light or the voice — to come to us in their purity, for the sensuous element comes to us first of all modified by these tunics of the eye and likewise by the passages of the ear.[202] But if we are to express ourselves in this particular manner, the direct opposite might likewise be maintained, that the sensuous element there present is simply purified; the apprehending ear, for example, again purifies the voice that comes in bodily form from a soul.

g. The seventh trope is the cohesion, the size or quantity of things, through which they appear different; for instance, we see how glass is transparent, but loses this transparency when it is pounded, and thus has its cohesion altered. Shavings of goat's-horn appear to be white, but the whole piece looks black; or Carrara marble ground into powder looks white, though the whole piece is yellow. The same holds good as regards quantity. A moderate portion of wine fortifies and exhilarates, a large quantity of it destroys the body, and the case is similar with drugs.[203] If the quantity is not to be spoken of as the substance, it is still an abstraction that quantity and combination are matters of indifference as regards quality and disintegration; the change of quantity likewise changes the quality.

h. The eighth trope arises from the relativity of things, and is thus the universal trope of relationship. This relativity of everything existent and thought is a more inward, real determinateness, and all the tropes already mentioned really aim at it. "According to this trope," says Sextus (Pyrrh. Hyp. I. c. 14, §§ 135, 136), "we conclude that since everything is in relation to something, we must withhold our judgment as to what it is on its own account and in its nature. But it must be remarked that we here make use of 'is' in the sense of appearance only. Relationship is used in two respects: first in relation to the judging subject," and this difference we saw in the previous tropes, "and in the second place in relation to the object which is to be judged, like right and left." Sextus, in the passage above (§§ 137, 140), argues as follows: "As regards what is set forth on its own account and separate from others, is it distinguished from the mere relative or not? If it were not different from it, it would itself be a relative. If it is different, it again is a relative. That is to say, what is different is related to something, for it is set forth in relation to that from which it is distinguished." Relativity, generally, is present in what is absolutely predicated, for relationship is a relationship in itself and not to another. Relationship

contains opposition: what is in relation to another is on the one hand independent on its own account, but on the other, because it is in relationship, it is likewise not independent. For if anything is only in relation to something else, the other likewise belongs to it; it is thus not on its own account. But if its other already belongs to it, its non-being also already belongs to it, and it is a contradictory as soon as it is not without its other. "But because we cannot separate the relative from its other, we likewise do not know what it is on its own account and in its nature, and we must consequently suspend our judgment."

i. The ninth trope is the more or less frequent occurrence of things, which likewise alters one's judgment upon the things. What happens seldom is more highly esteemed than what comes to pass frequently; and custom brings about the fact that one judges in this way and the other in that way. Custom is thus made a circumstance which also permits us to say that things appear so and so to us, but not universally and generally that they are so.[204] When men say of any particular things that "this is so," circumstances may be instanced in which the opposite predicate is applicable to them also. If, for example, we remain at the abstraction of the man, does it really signify whether or not we have a prince? — No. States? — No. A republic? — No, and so on, for they are here and not there.

k. The tenth trope mainly concerns ethics and is related to manners, customs and laws. What is moral and legal is likewise not such; for what is here considered to be right is elsewhere held to be wrong. The attitude of Scepticism in this regard is to show that the opposite of what is maintained as valid law holds equally good. As regards the ordinary understanding respecting the validity of this and that maxim, *e.g.* that the son has to pay the debts of his father, the ultimate and indeed only ground lies in its being said that this is true in its immediacy, for it holds good as law or custom. As against this the Sceptics likewise prove the opposite, saying for instance,

that the son has, indeed, to undertake the debts of the father by the law of Rhodes; but in Rome he does not require to do so, if he has renounced his claim on the paternal goods.[205] As in the existence of what is determined, which is held to be true because it is, the opposite is shown to exist; so in the case of laws, if their ground is that they are in force, their opposite can be demonstrated. The natural man has no consciousness of the presence of opposites; he lives quite unconsciously in his own particular way, in conformity with the morality of his town, without ever having reflected on the fact that he practises this morality. If he then comes into a foreign land, he is much surprised, for through encountering the opposite he for the first time experiences the fact that he has these customs, and he immediately arrives at uncertainty as to whether his point of view or the opposite is wrong. For the opposite of what held good to him holds equally good, and he does not possess any further ground for his practice; so that since the one holds good equally with the other, neither holds good.

We now see in these modes that, properly speaking, they are not logical modes at all, nor have they to do with the Notion, for they proceed directly against empiricism. Something is by immediate certainty given out as being true, the opposite of this last is from some other point of view demonstrated to be equally true, and thus its other-being is set forth as valid. The different modes in which the non-validity of the first and the validity of the other-being relate to one another, are ranged under the above heads. If we now classify these ten tropes in conformity with the plan indicated above by Sextus (p. 347), we find in the first four tropes the dissimilarity of the object to depend on the judging subject, because that which judges is either the animal or the man or one of his senses or particular dispositions in him. Or the dissimilarity depends on the object, and here we come to the seventh and tenth tropes, since first the amount makes a thing into something quite

different, and then the code of morals in different places makes itself the only absolute, excluding and prohibiting any other. The fifth, sixth, eighth and ninth tropes finally deal with a union of both sides, or these all together contain the relationship; this is a demonstration that the object does not present itself in itself, but in relation to something else.

From content and form we see in these modes their early origin; for the content, which has only to deal with Being, shows its change only, takes up only the variability of its manifestation, without showing its contradiction in itself, *i.e.* in its Notion. But in form they show an unpractised thought, which does not yet bring the whole of these examples under their universal points of view, as is done by Sextus, or which places the universal, relativity, alongside of its particular modes. On account of their dulness we are not accustomed to lay great stress on such methods, nor esteem them of any value; but, in fact, as against the dogmatism of the common human understanding they are quite valid. This last says directly, "This is so because it is so," taking experience as authority. Now through these modes this understanding will be shown that its belief has contingencies and differences within it, which at one time present a thing in this way and at another time in that way; and thereby it will be made aware that it itself, or another subject, with equal immediacy and on the same ground (on none at all), says: "It is not so, for it really is the opposite," Thus the signification of these tropes has still its value. Should faith or right be founded on a feeling, this feeling is in me, and then others may say: "It is not in me." If one person's tastes are to be accepted as authoritative, it is not difficult to demonstrate that another person's tastes are utterly opposite, but Being is thereby degraded into seeming, for in every assurance such as that, the opposite holds equally good.

2. The Later Tropes.

The five other sceptical tropes have an entirely different character, and it is at once evident that they indicate quite another point of view and degree of culture as regards philosophic thought; for they pertain more to thinking reflection, and contain the dialectic which the determinate Notion has within it. Sextus Empiricus[206] sets them forth as follows: —

a. The first trope is the diversitude in opinions (ἀπὸ τῆς διαφωνίας), and that not among animals and men, but expressly among philosophers; of this matter we have just spoken above (pp. 349, 350). Sextus, and an Epicurean quoted by Cicero (Vol. I. p. 16), adduce the manifold nature of dogmas, and from this the conclusion is drawn that the one has just as much support as the other. Philosophers and others still make copious use of this sceptical trope, which is consequently in great favour: on account of the diversitude in philosophies, they say, Philosophy has no value, and truth is unattainable because men have thought about it in ways so contradictory. This diversitude in philosophic opinion is said to be an invincible weapon against Philosophy; but the category of difference is very barren, and we have said in the introduction (Vol. I. pp. 17-19) how it is to be understood. The Idea of Philosophy is to all philosophers one and the same, even if they themselves are not aware of it; but those who speak so much of this diversity know as little about it. The true difference is not a substantial one, but a difference in the different stages of development; and if the difference implies a one-sided view, as it does with the Stoics, Epicureans, and Sceptics, in their totality undoubtedly we first reach truth.

b. A very important trope is that of failing into an infinite progression (ἡ εἰς ἄπειρον ἔκπτωσις); by it the Sceptics show that the reason which is brought forward for an assertion itself again requires a reason, and this again another, and so on into infinitude; from this suspension of judgment thus likewise follows, for there is nothing which can furnish a solid foundation. Consequently no permanent ground can be pointed out, for each

continues to press further and further back, and yet finally a cessation must be made. In more recent times many have plumed themselves on this trope, and, in fact, it is as regards the understanding and the so-called syllogism (*supra*, pp. 222, 223), a trope of great force. For if deduction from reasons is made the power of knowledge, we must, on the other hand, remember that by so doing we have premises which are quite ungrounded.

c. The trope of Relationship, the relativity of determinations (ὁ ἀπὸ τοῦ πρός τι), has already been found among those mentioned above (p. 353). It is that what is maintained shows itself as it appears, partly merely in relation to the judging subject and partly to other things, but not as it is in itself by nature.

d. The fourth trope is that of Pre-supposition (ὁ ἐξ ὑποθέσεως): "When the dogmatists see that they are thrown back into the infinite, they put forward something as principle which they do not prove, but wish to have conceded to them simply and without proof:" that is an axiom. If the dogmatist has the right to pre-suppose an axiom as unproved, the sceptic has equally the right, or, if we choose to say so, equally no right, to pre-suppose the opposite as unproved. One is as good as the other. Thus all definitions are pre-suppositions. For instance, Spinoza pre-supposes definitions of the infinite, of substance, of attribute, &c.; and the rest follows consistently from them. Nowadays men prefer to give assurances and speak of facts of consciousness.

e. The last trope is that of Reciprocity (διάλληλος), or proof in a circle. "That which is dealt with is grounded on something which itself again requires something else as its ground; now that which has been said to be proved by it is used for this purpose, so that each is proved through the other." When we would avoid infinite progression and the making of pre-suppositions, we use again that which was proved to prove its own proof.

To the question, “What is the ground of the phenomenon?” the reply is “Power,” but this is itself merely deduced from the moments of the phenomenon.

Now Sextus shows (Pyrrh. Hyp. I. c. 15, §§ 169-177) in the following way that, speaking generally, all sceptical investigations pass into these five modes of reasoning; and from this it is likewise clear that Scepticism is not really a reasoning against anything from reasons which can be found, which quick-wittedness discovers in the particular object, but that it has a profound knowledge of the categories. (α) “The object before us is either one felt” (according to Epicurus), “or one thought” (according to the Stoics). “But however it may be determined, there always is a difference of opinion respecting it,” and specially of sophic opinions. This is the first trope. “For some believe what is felt and others what is thought to be alone the truth,” *i.e.* the criterion; “others, however, again accept partly what is thought and partly what is felt.” There consequently is a contradiction present here. “Now is it possible to harmonize this contradiction or not? If not, we must withhold our judgment. But if it is to be solved, the question is, ‘How shall we decide?’” What is to contain the criterion, the standard, the implicit? “Is what is felt to be judged by what is felt, or by what is thought?” (β) Either side, individually considered as the implicit, passes, according to the Sceptics, into the infinite; but this is a description which must necessarily be proved on its own account. “If what is felt is to be judged by what is felt, it is allowed (since feeling is in question) that this sensation requires another sensation as its reason;” for the conviction of its truth is not without contradiction. “But if that which constitutes the reason is again a feeling, that which is said to be a reason must have a reason just as much; thus we go on into infinitude” — and here we have the second trope. The case is, however, similar if what is thought is the criterion, or if the implicit is made to rest on it. “If to what is thought is given the power of

judging what is felt, this likewise, since it is that respecting which no harmony prevails, requires another as its ground. This reason is, however, something thought likewise, and it again requires a reason; thus this, too, passes into the infinite.” From effect men thus reach cause; nevertheless this too is not original, but is itself an effect; and so on. But if men thus progress into infinitude, they have no first original ground to stand on, for what is accepted as first cause is itself merely effect; and since they merely progress continually, it is implied that no ultimate is posited. The false belief that this progression is a true category, is also to be found in Kant and Fichte; but there is really no true ultimate, or, what is the same, no true first. The understanding represents infinite progression as something great; but its contradiction is that men speak of a first cause and it is then shown that it is only an effect. Men only attain to the contradiction and constant repetition of the same, but not to the solution of it, and consequently to the true *prius*. (γ) But should this endless progression not satisfy us — which the Sceptics indeed perceived — and therefore have to be put a stop to, this may happen by what is or what is felt having its foundation in thought, and, on the other hand, by likewise taking for the foundation of thought that which is felt. In this way each would be founded without there having been a progression into infinitude; but then that which founds would also be that which is founded, and there would merely be a passing from one to the other. Thus, in the third place, this falls into the trope of Reciprocity, in which, however, there is no more than there was before any true foundation. For in it each merely exists through the other, neither is really set forth absolutely, but each is the implicit only for the other, and this is self-abrogation. (δ) But if this is avoided by an unproved axiom which is taken as an implicit fact, a first and absolute ground, this way of arguing falls into the mode of Presupposition — the fourth trope. But if an assumption such as this were to be allowed, it would also be legitimate for anyone to assume the contrary. Thus

against the absolute assertion of idealism, “The Absolute is the I,” it is with equal force maintained that “The Absolute is existence.” The one man says in the immediate certainty of himself: “I am absolute to myself;” another man likewise in certainty of himself says, “It is absolutely certain to me that things exist.” Idealism did not prove the former, nor did it destroy the latter; it takes its stand alongside of it, and only bases its assertions on its own principle. Everything, however, then, comes round to this, that because the ‘I’ is absolute, the ‘not-I’ cannot be absolute. On the other hand it may be said as justly: “Because the thing is absolute, the ‘I’ cannot be absolute.” If it is legitimate, Sextus further says, immediately to pre-suppose something as unproved, it is absurd to pre-suppose anything else as proof of that on whose behalf it is pre-supposed; we only require to posit straightway the implicit existence of that which is in question. But as it is absurd to do so, so also is the other absurd. Men set to work in the finite sciences in a similar way. But when, as in a dogmatism like this, a man asserts his right of pre-supposing something, every other man has equally the right of pre-supposing something. Consequently the modern immediate revelation of the subject now appears. It does no good for any man to affirm, for example, that he finds in his consciousness that God exists; since anyone has the right to say that he finds in his consciousness that God does not exist. In modern times men have not got very far with this immediate knowledge — perhaps not further than the ancients, (ε) In the fifth place everything perceived has, according to the trope of Relationship, a relation to something else, to what perceives; its Notion is just that of being for another. The same holds good with what is thought; as the universal object of thought it likewise has the form of being something for another.

If we sum this up in a general way, the determinate, whether it is existent or thought, is (α) really, as determinate, the negative of another, *i.e.* it is related to another and exists for the same, and is thus in relationship; in this

everything is really exhausted. (β) In this relationship to another this last, posited as its universality, is its reason; but this reason, as opposed to that which is proved, is itself a determinate, and consequently has its reality only in what is proved. And for the reason that I really again consider this universal as a determinate, it is conditioned by another like the one that goes before, and so on into infinity. (γ) In order that this determinate for which, as in consciousness, the other is, should have existence, this other must exist, for in this it has its reality; and because this its object is likewise for another, they mutually condition each other and are mediated through one another, neither being self-existent. And if the universal as the basis has its reality in the existent, and this existent its reality in the universal, this forms the Reciprocity whereby what in themselves are opposites mutually establish one another. (δ) But what is implicit is something which is not mediated through another; as the immediate, that is because it is, it is, however, an Hypothesis. (ε) Now if this determinate is taken as presupposed, so also may another be. Or we might say more shortly that the deficiency in all metaphysics of the understanding lies partly in (α) the Demonstration, by which it falls into the infinite; and partly in (β) the Hypotheses, which constitute an immediate knowledge.

These tropes thus form an effective weapon against the philosophy of the ordinary understanding, and the Sceptics directed them with great acuteness, sometimes against the common acceptation of things, and sometimes against principles of philosophic reflection. These sceptical tropes, in fact, concern that which is called a dogmatic philosophy — not in the sense of its having a positive content, but as asserting something determinate as the absolute; and in accordance with its nature, such a philosophy must display itself in all these forms. To the Sceptics, the Notion of dogmatic philosophy is in effect that something is asserted as the implicit; it is thus opposed to idealism by the fact of its maintaining that an

existence is the absolute. But there is a misunderstanding or a formal understanding in considering that all philosophy that is not Scepticism is Dogmatism. Dogmatism, as the Sceptics quite correctly describe it, consists in the assertion that something determinate, such as ‘I’ or ‘Being,’ ‘Thought’ or ‘Sensation,’ is the truth. In the talk about idealism, to which dogmatism has been opposed, just as many mistakes have been made, and misunderstandings taken place. To the criticism which knows no implicit, nothing absolute, all knowledge of implicit existence as such is held to be dogmatism, while it is the most wanton dogmatism of all, because it maintains that the ‘I,’ the unity of self-consciousness, is opposed to Being, is in and for itself, and that the implicit in the outside world is likewise so, and therefore that the two absolutely cannot come together. By idealism that is likewise held to be dogmatism in which, as is the case in Plato and Spinoza, the absolute has been made the unity of self-consciousness and existence, and not self-consciousness opposed to existence. Speculative philosophy thus, indeed, asserts, but does not assert a determinate; or it cannot express its truth in the simple form of a proposition, although Philosophy is often falsely understood as pre-supposing an original principle from which all others are to be deduced. But though its principle can be given the form of a proposition, to the Idea what pertains to the proposition as such is not essential, and the content is of such a nature that it really abrogates this immediate existence, as we find with the Academicians. As a matter of fact, that which is now called a proposition, absolutely requires a mediation or a ground; for it is an immediate determinate that has another proposition in opposition to it, which last is again of a similar nature, and so on into infinitude. Consequently, each, as being a proposition, is the union of two moments between which there is an inherent difference, and whose union has to be mediated. Now dogmatic philosophy, which has this way of representing one principle in a

determinate proposition as a fundamental principle, believes that it is therefore universal, and that the other is in subordination to it. And undoubtedly this is so. But at the same time, this its determinateness rests in the fact that it is *only* universal; hence such a principle is always conditioned, and consequently contains within it a destructive dialectic.

As against all these dogmatic philosophies, such criticism and idealism not excepted, the sceptical tropes possess the negative capacity of demonstrating that what the former maintain to be the implicit is not really so. For implicitude such as this is a determinate, and cannot resist negativity, its abrogation. To Scepticism is due the honour of having obtained this knowledge of the negative, and of having so definitely thought out the forms of negativity. Scepticism does not operate by bringing forward what is called a difficulty, a possibility of representing the matter otherwise; that would merely indicate some sort of fancy which is contingent as regards this asserted knowledge. Scepticism is not an empiric matter such as this, for it contains a scientific aim, its tropes turn on the Notion, the very essence of determinateness, and are exhaustive as regards the determinate. In these moments Scepticism desires to assert itself, and the Sceptic therein recognizes the fancied greatness of his individuality; these tropes prove a more cultivated dialectic knowledge in the process of argumentation than is found in ordinary logic, the logic of the Stoics, or the canon of Epicurus. These tropes are necessary contradictions into which the understanding falls; even in our time progression into infinitude and presupposition (immediate knowledge) are particularly common (*supra*, p. 363).

Now, speaking generally, this is the method of Scepticism, and it is most important. Because the sceptical conscience demonstrates that in all that is immediately accepted there is nothing secure and absolute, the Sceptics

have taken in hand all particular determinations of the individual sciences, and have shown that they are not fixed. The further details of this application to the different sciences do not concern us here: this far-seeing power of abstraction is also requisite in order to recognize these determinations of negation or of opposition everywhere present in all concrete matter, and in all that is thought, and to find in this determinate its limits. Sextus, for example, takes up the individual sciences concretely, thereby demonstrating much capacity for abstraction, and he shows in all their determinations the opposite of themselves. Thus he sets the definitions of mathematics against one another, and that not externally, but as they are in themselves; he lays hold of the fact (adv. Math. III. 20-22) that there is said to be a point, space, line, surface, one, &c. We unquestioningly allow the point to rank as a simple unit in space, according to which it has no dimension; but if it has no dimension, it is not in space, and therefore is no longer a point. On the one hand it is the negation of space, and, on the other, inasmuch as it is the limit of space, it touches space. Thus this negation of space participates in space, itself occupies space, and thus it is in itself null, but at the same time it is also in itself a dialectic. Scepticism has thus also treated of ideas which are, properly speaking, speculative, and demonstrated their importance; for the demonstration of the contradiction in the finite is an essential point in the speculatively philosophic method.

The two formal moments in this sceptical culture are firstly the power of consciousness to go back from itself, and to take as its object the whole that is present, itself and its operation included. The second moment is to grasp the form in which a proposition, with whose content our consciousness is in any way occupied, exists. An undeveloped consciousness, on the other hand, usually knows nothing of what is present in addition to the content. For instance, in the judgment “This thing is one,” attention is paid only to the one and the thing, and not to the circumstance that here something, a

determinate, is related to the one. But this relation is the essential, and the form of the determinate; it is that whereby this house which is an individual, makes itself one with the universal that is different from it. It is this logical element, *i.e.* the essential element, that Scepticism brings to consciousness, and on this it depends; an example of this is number, the one, as the hypothetical basis of arithmetic. Scepticism does not attempt to give the thing, nor does it dispute as to whether it is thus or thus, but whether the thing itself is something; it grasps the essence of what is expressed, and lays hold of the whole principle of the assertion. As to God, for example, the Sceptics do not inquire whether He has such and such qualities, but turn to what is most inward, to what lies at the ground of this conception, and they ask whether this has reality. "Since we do not know the reality of God," says Sextus (Pyrrh. Hyp. III. c. I, § 4), "we shall not be able to know and perceive His qualities." Likewise in the preceding books (II. c. 4, sqq.), inquiry is made as to whether the criterion of truth as fixed by the understanding is anything, whether we know the thing in itself, or whether the 'I' is to itself the only absolute certainty. This is the way to penetrate to reality.

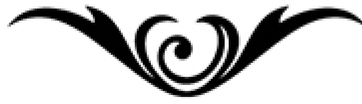
In these ways the operations of Scepticism are undoubtedly directed against the finite. But however much force these moments of its negative dialectic may have against the properly-speaking dogmatic knowledge of the understanding, its attacks against the true infinite of the speculative Idea are most feeble and unsatisfactory. For this last is in its nature nothing finite or determinate, it has not the one-sided character which pertains to the proposition, for it has the absolute negative in itself; in itself it is round, it contains this determinate and its opposite in their ideality in itself. In so far as this Idea, as the unity of these opposites, is itself again outwardly a determinate, it stands exposed to the power of the negative; indeed its nature and reality is just to move continually on, so that as determinate it

again places itself in unity with the determinates opposed to it, and thus organizes itself into a whole whose starting-point again coincides with the final result. This identity is quite different from that of the understanding; the object as concrete in itself, is, at the same time, opposed to itself; but the dialectic solution of this finite and other is likewise already contained in the speculative, without Scepticism having first had to demonstrate this; for the rational, as comprehended, does, as regards the determinate, just what Scepticism tries to do. However, if Scepticism attempts to deal with this properly speculative element, it can in no way lay hold of it, nor make any progress except by doing violence to the speculative itself; thus the method of its procedure against the rational is this, that it makes the latter into a determinate, and always first of all introduces into it a finite thought-determination or idea of relationship to which it adheres, but which is not really in the infinite at all; and then it argues against the same. That is to say it comprehends it falsely and then proceeds to contradict it. Or it first of all gives the infinite the itch in order to be able to scratch it. The Scepticism of modern times, with which for crudity of comprehension and false teaching the old cannot compare, is specially noteworthy in this respect. Even now what is speculative is transformed into something crude; it is possible to remain faithful to the letter, and yet to pervert the whole matter, because the identity of the determinate has been carried over to the speculative. What here appears to be most natural and impartial is to have an investigation made of what the principle of a speculative philosophy is; its essential nature seems to be expressed thereby, and nothing is apparently added or imputed to it, nor does any change appear to be effected in it. Now, here, according to the conception of the non-speculative sciences, it is placed in this dilemma: the principle is either an unproved hypothesis or demands a proof which in turn implies the principle. The proof that is demanded of this principle itself pre-supposes something else, such as the logical laws of

proof; these rules of logic are, however, themselves propositions such as required to be proved; and so it goes on into infinitude, if an absolute hypothesis to which another can be opposed is not made (*supra*, p. 362). But these forms of proposition, of consecutive proof, &c., do not in this form apply to what is speculative (*supra*, p. 364) as though the proposition were before us here, and the proof were something separate from it there; for in this case the proof comes within the proposition. The Notion is a self-movement, and not, as in a proposition, a desire to rest; nor is it true that the proof brings forward another ground or middle term and is another movement; for it has this movement in itself.

Sextus Empiricus (adv. Math. VII., 310-312), for example, thus reaches the speculative Idea regarding reason, which, as the thought of thought, comprehends itself, and is thus in its freedom at home with itself. We saw this (pp. 147-151) with Aristotle. In order to refute this idea, Sextus argues in the following way: "The reason that comprehends is either the whole or it is only a part." But to know the speculative it is requisite that there should be, besides the 'either ... or,' a third; this last is 'both ... and' and 'neither ... nor.' "If reason as the comprehending is the whole, nothing else remains to be comprehended. If the comprehending reason is, however, only a part which comprehends itself, this part again, as that which comprehends, either is the whole (and in that case again nothing at all remains to be comprehended), or else, supposing what comprehends to be a part in the sense that what is comprehended is the other part, that which comprehends does not comprehend itself," &c. In the first place, however, it is clear that by arguing thus nothing is shown further than the fact that here Scepticism in the first place brings into the relationship of thought thinking about thought, the very superficial category of the relationship of the whole and the parts, as understood by the ordinary understanding, which last is not found in that Idea, although as regards finite things the whole is simply

composed of all the parts, and these parts constitute the whole, the parts and the whole being consequently identical. But the relationship of whole and part is not a relationship of reason to itself, being much too unimportant, and quite unworthy of being brought into the speculative Idea. In the second place Scepticism is wrong in allowing this relationship to hold good immediately, as it does in the ordinary and arid conception, where we make no objection to it. When reflection speaks of a whole, there is for it beyond this nothing else remaining. But the whole is just the being opposed to itself. On the one hand it is as whole simply identical with its parts, and, on the other hand, the parts are identical with the whole, since they together constitute the whole. The self-comprehension of reason is just like the comprehension by the whole of all its parts, if it is taken in its real speculative significance; and only in this sense could this relationship be dealt with here. But in the sense implied by Sextus, that there is nothing except the whole, the two sides, the whole and the parts, remain in mutual, isolated opposition; in the region of speculation the two indeed are different, but they are likewise not different, for the difference is ideal. Outside of the whole there thus undoubtedly remains another, namely itself as the manifold of its parts. The whole argument thus rests upon the fact that a foreign determination is first of all brought within the Idea, and then arguments against the Idea are brought forward, after it has been thus corrupted by the isolation of a one-sided determination unaccompanied by the other moment of the determination. The case is similar when it is said; "Objectivity and subjectivity are different, and thus their unity cannot be expressed." It is indeed maintained that the words are literally adhered to; but even as contained in these words, the determination is one-sided, and the other also pertains to it. Hence this difference is not what remains good, but what has to be abrogated.



We may perhaps have said enough about the scientific nature of Scepticism, and we have concluded therewith the second section of Greek philosophy. The general point of view adopted by self-consciousness in this second period, the attainment of the freedom of self-consciousness through thought, is common to all these philosophies. In Scepticism we now find that reason has got so far that all that is objective, whether of Being or of the universal, has disappeared for self-consciousness. The abyss of the self-consciousness of pure thought has swallowed up everything, and made entirely clear the basis of thought. It not only has comprehended thought and outside of it a universe in its entirety, but the result, positively expressed, is that self-consciousness itself is reality. External objectivity is not an objective existence nor a universal thought; for it merely is the fact that the individual consciousness exists, and that it is universal. But though for us there is an object, yet this is for it no object, and thus it still has itself the mode of objectivity. Scepticism deduces no result, nor does it express its negation as anything positive. But the positive is in no way different from the simple; or if Scepticism aims at the disappearance of all that is universal, its condition, as immovability of spirit, is itself in fact this universal, simple, self-identical — but a universality (or a Being) which is the universality of the individual consciousness. Sceptical self-consciousness, however, is this divided consciousness to which on the one hand motion is a confusion of its content; it is this movement which annuls for itself all things, in which what is offered to it is quite contingent and indifferent; it acts according to laws which are not held by it to be true, and is a perfectly empiric existence. On another side its simple thought is the immovability of self-identity, but its reality, its unity with itself is something that is perfectly empty, and the actual filling in is any content that one chooses. As this simplicity, and at the same time pure confusion, Scepticism is in fact the wholly self-abrogating contradiction. For in it the

mind has got so far as to immerse itself in itself as that which thinks; now it can comprehend itself in the consciousness of its infinitude as the ultimate. In this way Scepticism flourishes in the Roman world, because, as we saw (p. 281), in this external, dead abstraction of the Roman principle (in the principle of Republicanism and imperial Despotism) the spirit has flown from an existence here and now, that could give it no satisfaction, into intellectuality. Then because here the mind can only seek reconciliation and eudæmonism inwardly through cultured thought, and the whole aim of the world is merely the satisfaction of the individual, good can only be brought forth as individual work in each particular case. Under the Roman emperors we certainly find famous men, principally Stoics, such as Marcus Aurelius and others; they, however, only considered the satisfaction of their individual selves, and did not attain to the thought of giving rationality to actuality through institutions, laws and constitutions. This solitude of mind within itself is then truly Philosophy; but the thought is abstractly at home with itself as dead rigidity, and as to outward things it is passive. If it moves it only moves while bearing with it a contempt of all distinctions. Scepticism thus belongs to the decay both of Philosophy and of the world.

The stage next reached by self-consciousness is that it receives a consciousness respecting that which it has thus become, or its essential nature becomes its object. Self-consciousness is to itself simple essence; there is for it no longer any other reality than this, which its self-consciousness is. In Scepticism this reality is not yet an object to it, for to it its object is merely confusion. Because it is consciousness, something is for it; in this opposition only the vanishing content is for the sceptical consciousness, without its having been comprehended in its simple permanence. Its truth, however, is its immersion in self-consciousness, and the fact of self-consciousness becoming an object to itself. Thus reality has indeed the form of a universal in existence or in thought, but in this its self-

consciousness is really not a foreign thing as it is in Scepticism. In the first place it is not simple as immediate and merely existent, a complete 'other,' as when we speak of the soul being simple; for this last is the simple negative that turns back out of movement, out of difference, as the universal, into itself. In the second place this universal power that expresses that "I am at home with myself," has likewise the significance of the Being, which, as objective reality, has a permanence for consciousness, and does not merely, as with the Sceptics, disappear; for reason in it alone knows how to possess and to find itself. This inwardness of mind at home with itself has built in itself an ideal world, has laid the foundation and groundwork of the intellectual world, of a kingdom of God which has come down into actuality and is in unity with it, and this is the standpoint of the Alexandrian philosophy.

SECTION THREE Third Period: The Neo-Platonists.

SINCE SCEPTICISM IS the annulling of the opposites which in Stoicism and Epicureanism were accepted as the universal principles from which all other opposites took their rise, it likewise is the unity in which these opposites are found as ideal determinations, so that the Idea must now come into consciousness as concrete in itself. With this third development, which is the concrete result of all that has gone before, an entirely new epoch begins. Philosophy is now on quite a different footing, since, with the rejection of the criterion for subjective knowledge, finite principles in general also disappear; for it is with these that the criterion has to do. This then is the form which Philosophy takes with the Neo-Platonists, and which is closely connected with the revolution which was caused in the world by Christianity. The last stage which we reached — that subjective contentment and return of self-consciousness into itself which is attained by the renunciation of all that is fixed and objective, by flight into the pure, infinite abstraction in itself, by the absolute dearth of all determinate content — this stage had come to perfection in Scepticism, although the Stoic and Epicurean systems have the same end in view. But with this complete entering into and abiding within itself of infinite subjectivity, Philosophy had reached the standpoint at which self-consciousness knew itself in its thought to be the Absolute (Vol. II. p. 372); and since Philosophy now rejected the subjective and finite attitude of self-consciousness, and its manner of distinguishing itself from an unmeaning external object, it comprehended in itself the difference, and perfected the truth into an intelligible world. The consciousness of this, expressing itself as it did in the spirit of the world, now constitutes the object of Philosophy;

it was principally brought about by employing and reasoning from Platonic conceptions and expressions, but also by making use of those of the Aristotelians and Pythagoreans.

The idea which had now come home to men that absolute existence is nothing alien to self-consciousness, that nothing really exists for it in which self-consciousness is not itself immediately present — this is the principle which is now found as the universal of the world-spirit, as the universal belief and knowledge of all men; at once it changes the world's whole aspect, destroying all that went before, and bringing about a regeneration of the world. The manifold forms which this knowledge assumes do not belong to the history of Philosophy, but to the history of consciousness and culture. This principle appears as a universal principle of justice, by which the individual man, in virtue of his existence, has absolute value as a universal being recognized by all. Thus, as far as external politics are concerned, this is the period of the development of private rights relating to the property of individual persons. But the character of Roman culture, under which this form of philosophy falls, was at the same time abstract universality (Vol. II. p. 235), in the lifelessness of which all characteristic poetry and philosophy, and all citizen life perished. Cicero, for example, shows, as few philosophers do, an utter want of appreciation of the state of affairs in his country. Thus the world has in its existence separated into two parts; on the one side we have the atoms, private individuals, and on the other side a bond connecting them, though only externally, which, as power, had been relegated to one subject, the emperor. The Roman power is thus the real Scepticism. In the domain of thought we find an exact counterpart to this species of abstract universality, which, as perfect despotism, is in the decline of national life directly connected with the isolation of the atom, showing itself as the withdrawal into the aims and interests of private life.

It is at this point that mind once more rises above the ruin, and again goes forth from its subjectivity to the objective, but at the same time to an intellectual objectivity, which does not appear in the outward form of individual objects, nor in the form of duties and individual morality, but which, as absolute objectivity, is torn of mind and of the veritable truth. Or, in other words, we see here on the one hand the return to God, on the other hand the manifestation of God, as He comes before the human mind absolutely in His truth. This forms the transition to the mind's restoration, by the fact of thought, which had conceived itself only subjectively, now becoming objective to itself. Thus in the Roman world the necessity became more and more keenly felt of forsaking the evil present, this ungodly, unrighteous, immoral world, and withdrawing into mind, in order here to seek what there no longer can be found. For in the Greek world the joy of spiritual activity has flown away, and sorrow for the breach that has been made has taken its place. These philosophies are thus not only moments in the development of reason, but also in that of humanity; they are forms in which the whole condition of the world expresses itself through thought.

But in other forms some measure of contempt for nature here began to show itself, inasmuch as nature is no longer anything for itself, seeing that her powers are merely the servants of man, who, like a magician, can make them yield obedience, and be subservient to his wishes. Up to this time oracles had been given through the medium of trees, animals, &c., in which divine knowledge, as knowledge of the eternal, was not distinguished from knowledge of the contingent. Now it no longer is the gods that work their wonders, but men, who, setting at defiance the necessities of nature, bring about in the same that which is inconsistent with nature as such. To this belief in miracle, which is at the same time disbelief in present nature, there is thus allied a disbelief in the past, or a disbelief that history was just what it was. All the actual history and mythology of Romans, Greeks, Jews, even

single words and letters, receive a different meaning; they are inwardly broken asunder, having an inner significance which is their essence, and an empty literal meaning, which is their appearance. Mankind living in actuality have here forgotten altogether how to see and to hear, and have indeed lost all their understanding of the present. Sensuous truth is no longer accepted by them; they constantly deceive us, for they are incapable of comprehending what is real, since it has lost all meaning for their minds. Others forsake the world, because in it they can now find nothing, the real they discover in themselves alone. As all the gods meet together in one Pantheon, so all religions rush into one, all modes of representation are absorbed in one; it is this, that self-consciousness — an actual human being — is absolute existence. It is to Rome that all these mysterious cults throng, but the real liberation of the spirit appeared in Christianity, for it is therein that its true nature is reached. Now it is revealed to man what absolute reality is; it is a man, but not yet Man or self-consciousness in general.

The one form of this principle is therefore the infinitude in itself of the consciousness that knows itself, distinguishes itself in itself, but yet remains in perfectly transparent unity with itself; and only as this concretely self-determining thought has mind any meaning. An actual self-consciousness is the fact that the Absolute is now known in the form of self-consciousness, so that the determinations of the former are manifested in all the forms of the latter; this sphere does not properly belong to Philosophy, but is the sphere of Religion, which knows God in this particular human being. This knowledge, that self-consciousness is absolute reality, or that absolute reality is self-consciousness, is the World-spirit. It is this knowledge, but knows this knowledge not; it has merely an intuition of it, or knows it only immediately, not in thought. Knowing it only immediately means that to the World-spirit this reality as spirit is doubtless absolute self-consciousness, but in existent immediacy it is an individual man. It is this individual man,

who has lived at a particular time and in a particular place, and not the Notion of self-consciousness, that is for the World-spirit absolute spirit: or self-consciousness is not yet known nor comprehended. As an immediacy of thought, absolute reality is immediate in self-consciousness, or only like an inward intuition, in the same way that we have pictures present in our mind.

The other form is that this concrete is grasped in a more abstract way, as the pure identity of thought, and thus there is lost to thought the point of self-hood pertaining to the concrete. This aspect, expressed as absolute reality in the form of mind in conceiving thought, but yet as in some measure existing immediately in self-consciousness as absolute reality, comes under Philosophy. But spirit, if complete in every aspect, must have also the natural aspect, which in this form of philosophy is still lacking. Now as in Christianity universal history makes this advance of mind in the consciousness of itself, so in the innermost mysteries of the same, in Philosophy, this same change must just as inevitably take place; in fact, Philosophy in her further development does nothing else than grasp this Idea of absolute reality, which in Christianity is merely shadowed forth. Absolute Spirit implies eternal self-identical existence that is transformed into another and knows this to be itself; the unchangeable, which is unchangeable in as far as it always, from being something different, returns into itself. It signifies the sceptical movement of consciousness, but in such a form that the transient objective element at the same time remains permanent, or in its permanence has the signification of self-consciousness.

In the Christian religion this spiritual reality was first of all represented as indicating that eternal reality becomes for itself something different, that it creates the world, which is posited purely as something different. To this there is added later this moment, that the other element in itself is not anything different from eternal reality, but that eternal reality manifests

itself therein. In the third place there is implied the identity of the other and eternal reality, Spirit, the return of the other into the first: and the other is here to be understood as not only the other at that point where eternal reality manifested itself, but as the other in a universal sense. The world recognizes itself in this absolute reality which becomes manifest; it is the world, therefore, which has returned into reality; and spirit is universal Spirit. But since this Idea of spirit appeared to the Christians first of all in the bare form of ordinary conception, God, the simple reality of the Jews, was for them beyond consciousness; such a God doubtless thinks, but He is not Thought, for He remains beyond reality, and He is only that which is distinguished from the world that our senses perceive. There likewise stands in opposition to the same an individual man — the moment of unity of the world and reality, and spirit, the universality of this unity, as a believing community, which possesses this unity only in the form of ordinary conception, but its reality in the hope of a future.

The Idea in pure Thought — that God's way of working is not external, as if He were a subject, and therefore that all this does not come to pass as a casual resolution and decree of God, to whom the thought of so acting happened to occur, but that God is this movement as the self-revealing moments of His essence, as His eternal necessity in Himself, which is not at all conditioned by chance — this we find expressed in the writings of philosophic or expressly Platonic Jews. The place where this point of view took its origin happens to be the country where East and West have met in conflict; for the free universality of the East and the determinateness of Europe, when intermingled, constitute Thought. With the Stoics the universality of thought has a place, but it is opposed to sensation, to external existence. Oriental universality is, on the contrary, entirely free; and the principle of universality, posited as particular, is Western Thought. In Alexandria more especially this form of philosophy was cultivated, but at

the same time regard was had to the earlier development of thought, in which lie the partially concealed beginnings of the building up in thought of the concrete, which is now the point mainly regarded. Even in the Pythagorean philosophy we found difference present as the Triad; then in Plato we saw the simple Idea of spirit as the unity of indivisible substance and other-being, though it was only as a compound of both. That is the concrete, but only in simple moments, not in the comprehensive manner in which other-being is in general all reality of nature and of consciousness, — and the unity which has returned as this self-consciousness is not only a thought, but living God. With Aristotle, finally, the concrete is ἐνέργεια, Thought which is its own object, the concrete. Therefore although this philosophy is known as Neo-Pythagorean and Neo-Platonic, it may also be termed Neo-Aristotelian; for the Alexandrians studied Aristotle just as much as Plato, and valued both very highly, later on combining their philosophies in one unity.

But we must have a clearer grasp of the difference between this point of view and the earlier. Already in the earlier philosophies we have seen, that νοῦς is the essence of the world, and similarly Aristotle comprehended the whole series of things endued with life and mind in such a way as to recognize the Notion to be the truth of these things. In the case of the Stoics this unity, this system, was most definitely brought forward, while Aristotle rather followed up the particulars. This unity of thought we saw among the Stoics more especially on the one side as the return of self-consciousness into itself, so that spirit through the purity of thought is independent in itself; on the other hand we have seen there an objectivity in which the λόγος became essentially the all-penetrating basis of the whole world. With the Stoics, however, this basis remained as substance only, and thus took on the form of Pantheism, for that is the first idea that we light on when we determine the universal to be the true. Pantheism is the beginning of the

elevation of spirit, in that it conceives everything in the world to be a life of the Idea. For when self-consciousness emerges from itself, from its infinitude, from its thought directed on self, and turns to particular things, duties, relationships; or when thought, which thinks this universal substance, passes over from it to the particular, and makes the heavens, the stars, or man its object, it descends from the universal immediately into the particular, or immediately into the finite, since all these are finite forms. But the concrete is the universal which makes itself particular, and in this making of itself particular and finite yet remains eternally at home with itself. In Pantheism, on the contrary, the one universal substance merely makes itself finite, and thereby lowers itself. That is the mode of emanation, according to which the universal, in making itself the particular, or God in creating the world, by becoming particular becomes debased or deteriorated and sets a limit to Himself; so that this making of Himself finite is incompatible with any return into Himself. The same relation is also found in the mythology of the Greeks and Romans; the giving definiteness and form to God, who remains no empty abstraction, is a rendering finite of God, who thus becomes a mere work of art; but the Beautiful itself remains a finite form, which is not brought to such a point as to express the free Idea. The determination, the specialization, the reality of objectivity, must now be of such a nature that it shall be adequate to the absolute universal; the forms of the gods, as also natural forms and the forms which are known as duties, fail to be thus adequate.

What is therefore now required is that the knowing mind, which thus out of objectivity returns into itself and its inwardness, should reconcile with itself the world which it has left, so that the world's objectivity may of course be distinct from mind, yet adequate thereto. This concrete standpoint which, as it is that of the world, is also that of Philosophy, is the development of Mind, for it is requisite to Mind that it should not merely be

pure thought, but that it should be thought which makes itself objective, and therein maintains itself and is at home with itself. The earlier efforts of thought towards objectivity constitute a passing into determinateness and finitude merely, and not into an objective world adequate to absolute existence. The universal standpoint of the Neo-Platonic or Alexandrian philosophy now is from the loss of the world to produce a world which in its outwardness shall still remain an inward world, and thus a world reconciled; and this is the world of spirituality, which here begins. Thus the fundamental Idea was Thought which is its own object, and which is therefore identical with its object, with what is thought; so that we have the one and the other, and the unity of both.

This concrete Idea has again come to the front, and in the development of Christianity, as thought also penetrated there, it became known as the Trinity; and this Idea is absolute reality. This Idea did not develop directly from Plato and Aristotle, but took the circuitous path of Dogmatism. With the earlier thinkers it doubtless immediately emerged as supreme; but beside and beyond it appears the other content in addition, the riches of the thoughts of Mind and of Nature; and so it is conceived. Aristotle has thus comprehended the kingdom of Nature; and with Plato development is represented only in a loose multiplicity. But in order that the Idea should appear as the truth that encompasses and includes all within itself, it was requisite that this finite, this wider content of determinations which had been collected, should be comprehended on its finite side also, that is, in the finite form of a universal opposition. That was the function of Dogmatism, which was then dissolved by Scepticism. The dissolution of all that is particular and finite, which constitutes the essence of the latter, was not taken in hand by Plato and Aristotle, and therefore the Idea was not posited by them as all-inclusive. Now the contradiction is done away with, and Mind has attained to its negative rest. The affirmative, on the other hand, is

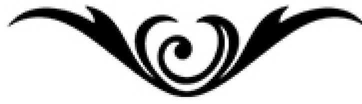
the repose of mind in itself, and to this freedom from all that is particular Mind now proceeds. It is the knowledge of what Mind is in itself, after it has come to be reconciled in itself through the dissolution of all finality. This eternal rest of Mind in itself now constitutes its object; it is aware of the fact, and strives to determine and develop it further by thought. In this we likewise possess the principle of evolution, of free development; everything except Mind is only finite and transitory. When therefore Mind goes forth to the particular, the particular is determined as something plainly contained in this ideality, which Mind knows as something subject to itself. That is the affirmative result of sceptical philosophy. It is evident that, starting from this point of view, an utterly different opinion will be expressed. God, as absolute pure Mind in and for Himself, and His activity in Himself, are now the object. But God is no longer known as the Abstract, but as the Concrete in Himself, and this Concrete is nothing but Mind. God is living, the One and the Other and the unity of these distinct determinations; for the abstract is only the simple, but the living has difference in itself, and is yet therein at home with itself.

Further, the following points have specially claimed the attention of Mind; firstly, that this consciousness which has become subjective makes its object the absolute as truth, placing this absolute outside of itself; or that it attains to faith in God, that God is now manifested, and reveals Himself, that is, exists for consciousness. The absolute, altogether universal, posited at the same time as objective, is God. Here comes in the relation of man to this his object, to absolute truth. This new standpoint, which from this time acquires an absolute interest, is therefore not a relation to external things, duties and the like; these are all determined, limited, they are not the all-embracing determination, as that is which has just been spoken of. In this relation the mere turning of the subject on himself, this talk of the wise man. in his one-sidedness, is likewise done away with. The same liberty,

happiness, steadfastness, which were the aim of Epicureanism, Stoicism and Scepticism are doubtless still to be reached by the subject, but now this can only be brought about by turning to God, by giving heed to absolute truth, not by fleeing from the objective; so that by means of the objective itself, liberty and happiness are attained for the subject. This is the standpoint of reverencing and fearing God, so that by man's turning to this his object, which stands before him free and firm, the object of the subject's own freedom is attained.

In the second place, there are contradictions herein contained which necessarily attract the attention of mind, and whose reconciliation is essential. If we adopt this one-sided position, God is on the one side, and man in his freedom is on the other. A freedom such as this, standing in contrast to the objective, a freedom in which man, as thinking self-consciousness, conceives as the absolute the relation of his pure inwardness to himself, is, however, only formally, and not concretely absolute. In so far then as the human will determines itself negatively towards the objective, we have the origin of sin, evil in contrast to the absolute Affirmative.

A third essential point of interest is the form in which God must now be apprehended in general, for since it pertains essentially to the Notion of Mind to determine God as concrete, living God, it is indispensable that God should be thought of in relation to the world and to man. This relation to the world is then a relation to an 'other,' which thereby at first appears to be outside of God; but because this relation is *His* activity, the fact of having this relation in Himself is a moment of Himself. Because the connection of God with the world is a determination in Himself, so the being another from the one, the duality, the negative, the distinction, the self-determination in general, is essentially to be thought of as a moment in Him, or God reveals Himself in Himself, and therefore establishes distinct determinations in Himself. This distinction in Himself, His concrete nature, is the point where



the absolute comes into connection with man, with the world, and is reconciled with the same. We say God has created man and the world, this is His determination in Himself, and at the same time the point of commencement, the root of the finite in God Himself. In this manner, therefore, that which afterwards appears finite is yet produced by Him in Himself — the particular Ideas, the world in God Himself, the Divine world, where God has begun to separate Himself, and has His connection with the temporal world. In the fact that God is represented as concrete, we have immediately a Divine world in Himself.

Since the Divine forms, as natural and political, have now separated themselves from the True, and the temporal world has appeared to men as the negative, the untrue, so, in the fourth place, man recognizes God in Mind; he has recognized that natural things and the State are not, as in mythology, the mode in which God exists, but that the mode, as an intelligible world, exists in Himself. The unhappiness of the Roman world lay in its abstraction from that in which man had hitherto found his satisfaction; this satisfaction arose out of that pantheism, in which man found his highest truth in natural things, such as air and fire and water, and further in his duties, in the political life of the State. Now, on the contrary, in the world's grief over her present woes, despair has entered in, and disbelief in these forms of the natural finite world and in the moral world of citizen life; to this form of reality, in its external and outwardly moral character, man has proved untrue. That condition which man terms the life of man in unity with nature, and in which man meets with God in nature because he finds his satisfaction there, has ceased to exist. The unity of man with the world is for this end broken, that it may be restored in a higher unity, that the world, as an intelligible world, may be received into God. The relation of man to God thereby reveals itself in the way provided for our salvation in worship, but more particularly it likewise shows itself in

Philosophy; and that with the express consciousness of the aim that the individual should render himself capable of belonging to this intelligible world. The manner in which man represents to himself his relation to God is more particularly determined by the manner in which man represents to himself God. What is now often said, that man need not know God, and may yet have the knowledge of this relation, is false. Since God is the First, He determines the relation, and therefore in order to know what is the truth of the relation, man must know God. Since therefore thought goes so far as to deny the natural, what we are now concerned with is not to seek truth in any existing mode, but from our inner Being to go forth again to a true objective, which derives its determination from the intrinsic nature of thought.

These are the chief moments of the present standpoint, and the reflections of the Neo-Platonists belong to it. Before entering upon them we must, however, make cursory mention of Philo the Jew, and also notice sundry moments appearing in the history of the Church.

A. Philo.

PHILO, A LEARNED Jew of Alexandria, lived before and after the birth of Christ, in the reigns of the first Roman Emperors; that is to say, he was born B.C. 20, but lived until after Christ's death. In him we for the first time see the application of the universal consciousness as philosophical consciousness. In the reign of Caligula, before whom very heinous charges against the Jews had been brought by Apion, he was, when advanced in years, sent to Rome as ambassador from his people, in order to give to the Romans a more favourable account of the Jews. There is a tradition that he came also in the reign of the Emperor Claudius to Rome, and there fell in with the Apostle Peter.[207]

Philo wrote a long series of works, many of which we still possess; for instance, those on The Creation of the World, on Rewards and Punishments, the Offerers of Sacrifices, the Law of Allegories, Dreams, the Immutability of God, &c.; they were published in folio at Frankfort in 1691, and afterwards by Pfeiffer at Erlangen. Philo was famous for the great extent of his learning, and was well acquainted with Greek philosophy.

He is more especially distinguished for his Platonic philosophy, and also for the pains he took to demonstrate the presence of Philosophy in the sacred writings of the Jews. In his explanation of the history of the Jewish nation, the narratives and statements therein contained have lost for him the immediate significance of reality. He reads into them throughout a mystical and allegorical meaning, and finds Plato present in Moses; in short, the endeavour of Philo resembled that of the Alexandrians when they recognized philosophic dogmas in Greek mythology. He treats of the nature

of Mind, not, indeed, as comprehended in the element of thought, but as expressed therein, and this expression is still both far from pure and is associated with all sorts of imageries. By the spirit of Philosophy the Jews were compelled to seek in their sacred books, as the heathen sought in Homer and in the popular religion, a deeper speculative meaning, and to represent their religious writings as a perfect system of divine wisdom. That is the character of the time, in consequence of which all that appealed to the finite understanding in popular conceptions has not endured. The important point, then, is that on the one hand the popular conception is here still allied with the forms of reality; but as, on the other hand, what these forms express only immediately is no longer sufficient, the desire arises to understand them in a deeper sense. Although in the external histories of the Jewish and heathen religions men had the authority and starting-point of truth, they yet grasped the thought that truth cannot be given externally. Therefore, men read deep thoughts into history, as the expression is, or they read them out of it, and this latter is the true conception. For in the case of the Divine Book, whose author is the Spirit, it cannot be said that this spirituality is absent. The point of importance comes to be, whether this spirituality lies deeper down or nearer to the surface; therefore, even if the man who wrote the book had not the thoughts, they are implicitly contained in the inward nature of the relation. There is, generally speaking, a great difference between that which is present therein and that which is expressed. In history, art, philosophy, and the like, the point of importance is that what is contained therein should also be expressed; the real work of the mind is wholly and solely that of bringing to consciousness what is contained therein. The other side of the matter is that although all that lies within a form, a-religion, &c., does not come before consciousness, one can still not say that it did not enter into the human mind; it was not in consciousness, neither did it come into the form of the ordinary conception,

and yet it was in mind. On the one side, the bringing of thought into definite consciousness is a bringing in from without, but on the other side, as far as matter is concerned, there is nothing brought in from without. Philo's methods present this aspect in a pre-eminent sense. All that is prosaic has disappeared, and, therefore, in writers of the period that follows, miracles are of common occurrence, inasmuch as external connection is no longer required as a matter of necessity. The fundamental conceptions of Philo, and these alone need be taken into consideration, are then somewhat as follows: —

1. With Philo the main point is the knowledge of God. In regard to this, he says, in the first place: God can be known only by the eye of the soul, only by Beholding (ὅρασις). This he also calls rapture, ecstasy, God's influence; we often find these terms. For this it is requisite that the soul should break loose from the body, and should give up its sensuous existence, thus rising to the pure object of thought, where it finds itself nearer to God. We may term this a beholding by the intelligence. But the other side is that God cannot be discerned by the eye of the soul; the soul can only know that He is, and not what He is. His essence is the primordial light.[208] Philo here speaks in quite Oriental fashion; for light is certainly simple, in contrast with which perception has the signification of knowing something as determined, as concrete in itself. So long, therefore, as the determination of simplicity is adhered to, this First Light permits not itself to be known, and since Philo says, "This One is God as such," we cannot know what God is. In Christianity, on the contrary, simplicity is only a moment, and only in the Whole do we find God the Spirit.

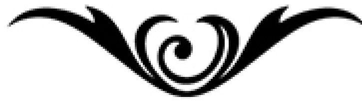
Philo continues: "The First is the space of the universe, encompassing and filling it; this existence is itself place, and is filled by itself. God is sufficient for Himself; all other things are paltry and meaningless; He fills all other things and gives them coherence, but He Himself is surrounded by

nothing, because He Himself is One and All. Similarly, God exists in the primordial form of time (αἰών),"[209] that is, in the pure Notion of time. Why is it necessary that God should fill Himself with Himself? Even the subjective and abstract has need also of an object. But the all is likewise, as with Parmenides, the abstract, because it is only substance, which remains empty beside that which fills it. Absolute fulness, on the other hand, is the concrete, and we reach this first in the λόγος, in which we have that which fills, that which is filled, and a third composed of both.

2. To this Philo now comes in the second place: "God's image and reflection is thinking reason (λόγος), the Firstborn Son, who rules and regulates the world. This λόγος is the innermost meaning of all Ideas; God Himself, in contrast to this, as the One, as such, is pure Being (τὸ ὄν) only[210] — an expression which Plato also used. Here verily we come upon a contradiction; for the image can only represent what the thing is; if therefore the image is concrete, its original must also be understood to be concrete. For the rest, it is therefore only logical, after Philo has once limited the name of God to the First Light or to pure Being, to assert that only the Son can be known. For as this Being God is only abstract existence, or only His own Notion; and it is quite true that the soul cannot perceive what this Being is, since it is really only an empty abstraction. What can be perceived is that pure existence is only an abstraction, and consequently a nothing, and not the true God. Of God as the One it may therefore be said that the only thing perceived is that He does exist. Perception is the knowledge of the concrete self-determination of the living God. If we therefore desire to know God, we must add to Being, as the First, this other moment also; the former is defective, and as abstract as when we say, 'God the Father,'" that is, this undisclosed One, this indeterminate in Himself, who has not yet created anything; the other moment is, however, the determination and distinction of Himself in

Himself, the begetting. What is begotten is His other, which at the same time is in Him, and belongs to Him, and is thus a moment of Himself, if God is to be thought of as concrete and living it is this that is here by Philo called λόγος. In Christianity the name of God is therefore not limited to Essence, but the Son is conceived of as a determination which itself belongs to the true Essence of God. That which God is, He is therefore as Spirit only, and that is the unity of these moments.

God’s differences therefore, according to Philo, constitute the finite understanding (λόγος) itself, which is then the archangel (ἀρχάγγελος), a realm of thought which contains determinateness. That is man as heavenly man, primeval man, who is also represented under the name of Wisdom (σοφία, תגמה), as Adam Kadmon, as the rising of the sun — man in God. This finite understanding now separates itself into Ideas, which by Philo are also named angels or messengers (ἄγγελοι). This mode of conception is not yet conception in pure thought, for forms of the imagination are still interwoven with it. Moreover there comes in here for the first time that which determines, where God is looked on as activity, which so far Being was not. This λόγος is therefore itself, we might say, the first restful world of thought, although it is already differentiated; but another λόγος is that which gives utterance (λόγος προφορικός) as speech. That is the activity, the creation of the world, as the former is its preservation, its permanent understanding. Speech has always been regarded as a manifestation of God, because it is not corporeal; as sound it is momentary and immediately disappears; its existence is therefore immaterial. “God created by the word of His month, interposing nothing;” what He created remains ideal, like speech. “If we would express the dogma in a still truer form, the Logos is the ‘Work of God.’”[211]



This Logos is at the same time the teacher of wisdom for self-consciousness. For natural things are upheld only in their laws; but self-

conscious beings know also of these laws, and this is wisdom. Thus the λόγος is the high priest, who is the mediator between God and man, the Spirit of the Godhead, who teaches man — even the self-conscious return of God into Himself, into that first unity of the primordial light. That is the pure intelligible world of truth itself, which is nothing other than the Word of God.[212]

3. In the third place, since thought has come to negativity, the sensuous existent world stands in opposition to this ideal world. Its principle with Philo, as with Plato, is matter, the negative (οὐκ ὄν).[213] As God is Being, so the essence of matter is non-being; it is not nothing, as when we say that God created the world out of nothing, for non-being, the opposite of Being, is itself a positive, and as good as Being. It exists, in so far as there is placed within it a resemblance to implicit truth. Philo had the true perception that the opposite of Being is just as positive as Being. If this seems absurd to anyone, he need only be reminded that really when we posit Being, the negative of Being is thinking — which is something very positive. But the next step, the Notion of this opposition, and the passing of Being into non-being, is not to be found in Philo. In general this philosophy is less a metaphysic of the Notion or of Thought itself, than a philosophy in which Mind appears only in pure Thought, and not here in the mode of ordinary conception — Notions and Ideas are still represented as independent forms. Thus, for instance, it is said: "In the beginning the Word of God created the heavens, which consist of the purest Being and are the dwelling-place of the purest angels, which do not appear, and are not perceptible by the senses," but by thought alone; these are the Ideas. "The Creator before the whole of the intelligible world made the incorporeal heavens and the non-sensuous earth, and the Idea of the air and of the void, and after this the incorporeal essence of the water and an incorporeal light, and a non-sensuous archetype (ἀρχέτυπος) of the sun and all the stars;"[214] and the sensuous world is the

anti-type of this. Philo now proceeds according to the Mosaic record. In the Old Testament history of creation, grass, plants, and trees are created on the third day, and on the fourth day lights in the firmament of heaven, the sun and moon. Philo therefore says (De mundi opificio, pp. 9, 10) that on the fourth day a number adorned the heavens, the four, the tetractys, the most perfect, &c. These are the main points in Philo's philosophy.

B. Cabala and Gnosticism.

THE CABALISTIC PHILOSOPHY and the Gnostic theology both occupied themselves with these same conceptions which Philo also had. To them also the First is the abstract, the unknown, the nameless; the Second is the unveiling, the concrete, which goes forth into emanation. But there is also to be found in some degree the return to unity, especially among Christian philosophers: and this return, which is accepted as the Third, belongs to the λόγος; so with Philo Wisdom, the teacher, the high priest, was that which in the contemplation of God leads back the Third to the First.

1. Cabalistic Philosophy.

Cabala is the name given to the secret wisdom of the Jews, with which, however, much that is dark and mysterious is mingled; regarding its origin also many fables are related. We are told of it that it is contained in two books, *Jezirah* (Creation) and *Sohar* (Brightness). *Jezirah*, the more important of these two books, is ascribed to a certain Rabbi Akibha; it is about to be published in a more complete form by Herr von Mayer, in Frankfort. The book has certain very interesting general principles, and this better portion of it consists of ideas, which in some respects resemble those of Philo, though they are more fancifully presented, and often sink into the fantastic. It is not of the antiquity which those who reverence the Cabala would assign to it; for they relate that this heavenly book was given to Adam to console him after his fall. It is a medley of astronomy, magic, medicine, and prophecy; sundry traces followed up historically indicate that such were cultivated in Egypt. Akibha lived soon after the destruction of

Jerusalem, and took an active part in a revolt of the Jews against Hadrian, in the course of which they collected an army two hundred thousand strong, in order to establish Barcochba as the Messiah; the revolt was, however, suppressed, and the Rabbi was flayed alive. The second book is said to have been the work of his disciple, Rabbi Simeon Ben Jochai, who was called the Great Light, the Spark of Moses.[215] Both books were translated into Latin in the seventeenth century. A speculative Israelite, Rabbi Abraham Cohen Irira, also wrote a book, the Door of Heaven (*Porta c\nlorum*); it is later, dating from the fifteenth century, and sundry references to the Arabians and Scholastics are contained in it. These are the sources of the high cabalistic wisdom.

In earlier times there is no representation among the Jews of God as being in His essence Light, of an opposite to God, Darkness and Evil, which is at strife with the Light; there is nothing of good and evil angels, of the Fall of the wicked, of their condemnation, of their being in Hell, of a future day of judgment for the good and the evil, of the corruption of the flesh. It was not until this time that the Jews began to carry their thoughts beyond their reality; only now does a world of spirit, or at least of spirits, begin to open itself up before them; before this these Jews cared only for themselves, being sunk in the filth and self-conceit of their present existence, and in the maintenance of their nation and tribes.

Further particulars of the Cabala are these. One is expressed as the principle of all things, as it is likewise the first source of all numbers. As unity itself is not one number among the rest, so is it with God, the basis of all things, the *En-Soph*. The emanation therewith connected is the effect of the first cause by the limitation of that first infinite whose boundary (ὅρος) it is. In this one cause all is contained *eminenter*, not *formaliter* but *causaliter*. The second element of importance is the Adam Kadmon, the first man, *Kether*, the first that arose, the highest crown, the microcosm, the

macrocosm, with which the world that emanated stands in connection as the efflux of light. By further expansion the other spheres or circles of the world came into being; and this emanation is represented as streams of light. In the first place there come forth ten of such emanations, *Sephiroth*, forming the pure world *Azilah*, which exists in itself and changes not. The second is the world *Beriah*, which does change. The third is the created world, *Jezirah*, the world of pure spirits set in matter, the souls of the stars — that is, further distinctions into which this dark and mysterious philosophy proceeds. In the fourth place comes the created world, the *Asijja*: it is the lowest, the vegetative and sensible world.[216]

2. The Gnostics.

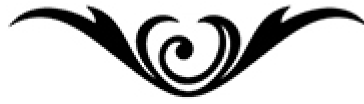
Though there are various sects of the Gnostics, we find certain common determinations constituting their basis.

\Joe Cooper\roddr\charliehoward\ — Professor Neander has with great learning made a collection of these, and elaborated them exhaustively; some of the forms correspond with those which we have given. Their general aim was that of knowledge (γνῶσις); whence they also derived their name.

One of the most distinguished Gnostics is Basilides. For him, too, the First is the unspeakable God (θεὸς ἄῤῥητος) — the *En-Soph* of the Cabala; He is, as with Philo also, that which is (τὸ ὄν), He who is (ὁ ὥν), the nameless one (ἀνωνόμαστος) — that is, the immediate. The second is then the Spirit (νοῦς), the first-born, also λόγος, the Wisdom (σοφία), Power (δύναμις): more closely defined, it is Righteousness (δικαιοσύνη), and Peace (εἰρήνη). These are followed by principles still further determined, which Basilides names archons, heads of spiritual kingdoms. One main point in this is likewise the return, the refining process of the soul, the economy of purification (οἰκονονία καθάρσεων): the soul from matter must

come back to wisdom, to peace. The First Essence bears all perfection sealed up in Himself, but only in potentiality; Spirit, the first-born, is the first revelation of the latent. It is, moreover, only through being made one with God that all created beings can attain to a share in true righteousness and the peace which flows therefrom.[217]

The Gnostics, for instance Marcus, term the First also the Unthinkable (ἀνεννόητος), even the Non-existent (ἀνούσιος) which proceeds not to determinateness, the Solitude (μονότης), and the pure Silence (σιγή); the Ideas, the angels, the æons, then form the Other. These are termed the Notions, roots, seeds of particular fulfillings (πληρώματα), the fruit; every æon in this bears its own special world in itself.[218]



With others, as for instance Valentinus, the First is also termed "the completed æon in the heights that cannot be seen or named," or the unfathomable, the primordial cause, the absolute abyss (ἄβυσσον, βῦθος), wherein all is, as abrogated: also what is even before the beginning (προάρχη), before the Father (προπάτωρ). The active transition of the One signifies then the differentiation (διάθεσις) of this abyss; and this development is also termed the making itself comprehensible of the incomprehensible (κατάληψις τοῦ ἀκαταλήπτου), in the same way that we found comprehension spoken of by the Stoics (Vol. II. p. 250). Æons, particular expositions, are Notions. The second step is likewise termed limitation (ὅρος); and inasmuch as the development of life is conceived more clearly by contrast, the key to this is stated to be contained in two principles, which appear in the form of male and female. The one is required to perfect the other, each has its complement (σύζυγος) in the other; from their conjunction (σύνθεσις, συξυγία), which first constitutes the real, a perfect whole proceeds. The inward significance of these fulfilments generally is the world of æons, the universal filling of the abyss, which therefore, inasmuch as what was distinguished in it was still

unrevealed, is also termed hermaphrodite, man-woman (ἀῤῥενόθηλυς),[219] — very much the same theory as was held long before by the Pythagoreans (Vol. I. p. 221).

Ptolemæus assigns two conjunctions (σύζυγους) to the abyss, and two separations, which are pre-supposed throughout all temporal existence, Will and Perception (θέλημα καὶ ἔννοια). Complicated and motley forms here appear, but the fundamental determination is the same throughout, and abyss and revelation are the most important matters. The revelation which has come down is also conceived as the glory (δόξα, Shekinah) of God; as heavenly wisdom, which is itself a beholding of God; as unbegotten powers which encircle Him and are radiant with the most brilliant light. To these Ideas the name of God is more especially given, and in this regard He is also called the many-named (πολυώνυμος), the demiurge; this is the manifestation, the determination of God.[220]

All these forms pass into the mysterious, but they have on the whole the same determinations as principle; and the general necessity which forms their basis is a profound necessity of reason, namely, the determination and comprehension of what is absolute as the concrete. I have, however, merely been desirous of calling these forms to remembrance, in order to indicate their connection with the universal.

C. Alexandrian Philosophy.

THE UNITY OF self-consciousness and Being appears in more philosophical and intelligent form in the Alexandrian School, which constitutes the most important, and at the same time the most characteristic form of philosophy pertaining to this sphere. For Alexandria had for some time past, mainly through the Ptolemies, become the principal seat of the sciences. Here, as if in their centre-point, all the popular religions and mythologies of the East and West, and likewise their history, came into touch and intermingled with one another in various forms and shapes. Religions were compared with one another: in each of them there was, on the one hand, a searching for and putting together of that which was contained also in the other, and, on the other hand, there was the more important task of reading into the popular conceptions of religion a deeper meaning, and of giving to them a universal allegorical signification. This endeavour has doubtless given birth to much that is dim and mystical; its purer product is the Alexandrian Philosophy. The bringing together of the philosophies naturally succeeded better than those connections which, on the side of religion, are only the mystic products of a Reason that as yet is unintelligible to itself. For while in fact there is but one Idea in Philosophy, it annuls by its own means the special form which it has adopted, the one-sidedness in which it expresses itself. In Scepticism had been reached this negative stage of seeing annulled the definite modes of Being in which the Absolute was posited.

Since the form of philosophy which arose in Alexandria did not attach itself to any of the earlier philosophic schools, but recognized all the different systems of philosophy, and more especially the Pythagorean,

Platonic, and Aristotelian, to be in their various forms but one, it was frequently asserted to be Eclecticism. Brucker (Hist. crit. phil. T. II., p. 193) is the first to do so, as I have found, and Diogenes Laërtius gave him the occasion thereto, by speaking (Pr\nmium, § 21) of a certain Potamo of Alexandria, who not so very long before (ρπὸ ὀλίγου) had selected from the different philosophies their principal maxims and the best of their teaching. Then Diogenes goes on to quote several passages from Potamo, saying that this writer had produced an eclectic philosophy; but these maxims drawn from Aristotle, Plato, and the Stoics are not of importance, and the distinguishing characteristics of the Alexandrians cannot be recognized therein. Diogenes is also earlier than the Alexandrian School; but Potamo, according to Suidas (s.v. Ποτάμον, T. III., p. 161), was tutor of the stepsons of Augustus, and for the instructor of princes eclecticism is a very suitable creed. Therefore, because this Potamo is an Alexandrian, Brucker has bestowed on the Alexandrian philosophy the name of Eclectic; but that is neither consistent with fact, nor is it true to history. Eclecticism is something to be utterly condemned, if it is understood in the sense of one thing being taken out of this philosophy, and another thing out of that philosophy, altogether regardless of their consistency or connection, as when a garment is patched together of pieces of different colours or stuffs. Such an eclecticism gives nothing but an aggregate which lacks all inward consistency. Eclectics of this kind are sometimes ordinary uncultured men, in whose heads the most contradictory ideas find a place side by side, without their ever bringing these thoughts together and becoming conscious of the contradictions involved; sometimes they are men of intelligence who act thus with their eyes open, thinking that they attain the best when, as they say, they take the good from every system, and so provide themselves with a *vade mecum* of reflections, in which they have everything good except consecutiveness of thought, and consequently thought itself. An eclectic

philosophy is something that is altogether meaningless and inconsequent: and such a philosophy the Alexandrian philosophy is not. In France the Alexandrians are still called Eclectics; and there, where *système* is synonymous with narrowness of views, and where indeed one must have the name which sounds least systematic and suspicious, that may be borne with.

In the better sense of the word the Alexandrians may, however, very well be called eclectic philosophers, though it is quite superfluous to give them this designation at all. For the Alexandrians took as their groundwork the philosophy of Plato, but availed themselves of the general development of Philosophy, which after Plato they became acquainted with through Aristotle and all the following philosophies, and especially through the Stoics; that is to say, they reinstated it, but as invested with a higher culture. Therefore we find in them no refutation of the views of the philosophers whom they quote. To this higher culture there more especially belongs the deeper principle that absolute essence must be apprehended as self-consciousness, that its very essence is to be self-consciousness, and that it is therefore in the individual consciousness. This is not to be understood as signifying that God is a Spirit who is outside of the world and outside self-consciousness, as is often said, but as indicating that His existence as self-conscious spirit is really self-consciousness itself. The Platonic universal, which is in thought, accordingly receives the signification of being as such absolute essence. In the higher sense a wider point of view as regards the Idea thus signifies its concretely blending into one the preceding principles, which contain only single one-sided moments of the Idea. This really indicates a deeper knowledge of the philosophical Idea which is known concretely in itself, so that the more abstract principles are contained in the deeper form of the Idea. For after some divergence has taken place in the past it must from time to time come about that the implicit identity of the

divergent views is recognized, so that difference has force only as form. In this sense even Plato is eclectic, since he harmonized Pythagoras, Heraclitus, and Parmenides; and the Alexandrians are also thus eclectics, seeing that they were just as much Pythagoreans as Platonists and Aristotelians; the only thing is that this term always at once calls up the idea of an arbitrary selection.

All earlier philosophies could therefore find a place in that of the Alexandrians. For in Alexandria the Ptolemies had attracted to themselves science and the learned, partly by reason of their own interest in science, and partly on account of the excellence of their institutions. They founded the great and celebrated library for which the Greek translation of the Old Testament was made; after Cæsar had destroyed it, it was again restored. There was also there a museum, or what would nowadays be called an Academy of Science, where philosophers and men of special learning received payments of money, and had no other duties than that of prosecuting scientific study. In later times such foundations were instituted in Athens also, and each philosophic school had its own public establishment,[221] without favour being shown to one philosophy or to the other. Thus the Neo-Platonic philosophy arose beside the others, and partly upon their ruins, and overshadowed the rest, until finally all earlier systems were merged therein. It, therefore, did not constitute an individual philosophical school similar to those which went before; but, while it united them all in itself, it had as its leading characteristic the study of Plato, of Aristotle, and of the Pythagoreans.

With this study was combined an interpretation of the writings of these men, which aimed at exhibiting their philosophic ideas in their unity; and the principal mode in which the Neo-Platonic teachers carried on and elaborated Philosophy consisted in their explaining the various philosophical works, especially the writings of Plato and Aristotle, or giving

sketches of these philosophies. These commentaries on the early philosophers were either given in lectures or written; and many of them have come down to us, some in the number being excellent. Aristotle's works were commented on by Alexander Aphrodisiensis, Andronicus Rhodius, Nicolaus Damascenus, and also Porphyrius. Plato had as commentators Numenius and Maximus Tyrius. Other Alexandrians combined a commentary on Plato with study of the other philosophic maxims or philosophies, and managed to grasp the point of unity of the various modes of the Idea very successfully. The best commentaries date from this period; most of the works of Proclus are commentaries on single dialogues of Plato and similar subjects. This school has the further peculiarity of expressing speculation as actual divine Being and life, and, therefore, it makes this appear to be mystical and magical.

1. Ammonius Saccas.

Ammonius Saccas, that is, the sack-bearer, is named as one of the first or most celebrated teachers of this school; he died A.D. 243.[222] But we have none of his writings, nor have any traditions regarding his philosophy come down to us. Among his very numerous disciples Ammonius had many men celebrated in other branches of science, for example, Longinus and Origen; it is, however, uncertain if this were the Christian Father of that name. But his most renowned disciple in philosophy is Plotinus, through whose writings as they are preserved to us we derive our chief knowledge of the Neo-Platonic philosophy. The systematized fabric of this philosophy is, indeed, ascribed to him by those who came after, and this philosophy is known specially as his philosophy.

2. Plotinus.

As the disciples of Ammonius had, by their master's desire, made an agreement not to commit his philosophy to writing, it was not until late in life that Plotinus wrote; or, rather, the works received from him were published after his death by Porphyrius, one of his disciples. From the same disciple we have an account of the life of Plotinus; what is remarkable in it is that the strictly historical facts recounted are mixed up with a great variety of marvellous episodes. This is certainly the period when the marvellous plays a prominent part; but when the pure system of Philosophy, the pure meaning of such a man, is known, it is impossible to express all one's astonishment at anecdotes of this kind. Plotinus was an Egyptian; he was born at Lycopolis about A.D. 205, in the reign of Septimius Severus. After he had attended the lectures of many teachers of Philosophy, he became melancholy and absorbed in thought; at the age of eight and twenty he came to Ammonius, and, finding here at last what satisfied him, he remained for eleven years under his instruction. As at that time wonderful accounts of Indian and Brahminical wisdom were being circulated, Plotinus set out on his way to Persia in the army of the Emperor Gordian; but the campaign ended so disastrously that Plotinus did not attain his object, and had difficulty even in procuring his own safety. At the age of forty he proceeded to Rome, and remained there until his death, twenty-six years later. In Rome his outward demeanour was most remarkable; in accordance with the ancient Pythagorean practice, he refrained from partaking of flesh, and often imposed fasts on himself; he wore, also, the ancient Pythagorean dress. As a public lecturer, however, he gained a high reputation among all classes. The Emperor of those days, Gallienus, whose favour Plotinus enjoyed, as well as that of the Empress, is said to have been inclined to hand over to him a town in Campania, where he thought to realize the Platonic Republic. The ministers, however, prevented the carrying out of this plan, and therein they showed themselves men of sense, for in such an

outlying spot of the Roman Empire, and considering the utter change in the human mind since Plato's days, when another spiritual principle had of necessity to make itself universal, this was an enterprise which was far less calculated than in Plato's time to bring honour to the Platonic Republic. It does little credit to the sagacity of Plotinus that this idea ever entered into his head; but we do not exactly know if his plan were limited to the Platonic Republic, or if it did not admit of some extension or modification thereof. Of course an actual Platonic state was contrary to the nature of things; for the Platonic state is free and independent, which such an one as this, within the Roman Empire, could of course not be. Plotinus died at Rome, in the sixty-sixth year of his age, A.D. 270.[223]

The writings of Plotinus are originally for the most part answers given as occasion required to questions proposed by his auditors; he committed them to writing during the last sixteen years of his life, and Porphyrius edited them some time later. In his teaching Plotinus adopted, as has been already mentioned, the method of commenting in his lectures on the writings of various earlier philosophers. The writings of Plotinus are known as Enneads, and are six in number, each of them containing nine separate treatises. We thus have altogether fifty-four of such treatises or books, which are subdivided into many chapters; it is consequently a voluminous work. The books do not, however, form a connected whole; but in each book, in fact, there are special matters brought forward and philosophically handled; and it is thus laborious to go through them. The first Ennead has for the most part a moral character; the first book proposes the question of what animals are, and what man is; the second deals with the virtues; the third with dialectic; the fourth with happiness (περὶ εὐδαιμονίας); the fifth investigates whether happiness consists in protraction of time (παρατάσει χρόνου); the sixth speaks of the beautiful; the seventh of the highest (πρώτου) good and of the other goods; the eighth inquires into the origin of

evil; the ninth treats of a rational departure from life. Other Enneads are of a metaphysical nature. Porphyrius says in his Life of Plotinus (pp. 3-5, 9, 17-19) that they are unequal. He states that twenty-one of these books were already in written form before he came to Plotinus, which was when the latter was fifty-nine years of age; and in that year and the five following, which Porphyrius spent with Plotinus as his disciple, other four-and-twenty were added. During the absence of Porphyrius in Sicily, Plotinus wrote nine more books, in the last years before his death, which later books are weaker. Creuzer is preparing to bring out an edition of Plotinus. To give an account of him would be a difficult task, and would amount to a systematic explanation. The mind of Plotinus hovers over each of the particular matters that he deals with; he treats them rationally and dialectically, but traces them all back to one Idea. Many beautiful detached quotations could be made from Plotinus, but as there is in his works a continual repetition of certain leading thoughts, the reading of them is apt to prove wearisome. Since then it is the manner of Plotinus to lead the particular, which he makes his starting-point, always back again to the universal, it is possible to grasp the ideas of Plotinus from some of his books, knowing that the reading of those remaining would not reveal to us any particular advance. Plato's ideas and expressions are predominant with him, but we find also many very lengthy expositions quite in the manner of Aristotle; for he makes constant use of terms borrowed from Aristotle — force, energy, &c. — and their relations are essentially the object of his meditations. The main point is that he is not to be taken as placing Plato and Aristotle in opposition; on the contrary, he went so far as to adopt even the Logos of the Stoics.

It is very difficult to give a systematic account of his philosophy. For it is not the aim of Plotinus, as it was of Aristotle, to comprehend objects in their special determinations, but rather to emphasize the truth of the substantial in

them as against the phenomenal. The point of greatest importance and the leading characteristic in Plotinus is his high, pure enthusiasm for the elevation of mind to what is good and true, to the absolute. He lays hold of knowledge, the simply ideal, and of intellectual thought, which is implicitly life, but not silent nor sealed. His whole philosophy is on the one hand metaphysics, but the tendency which is therein dominant is not so much an anxiety to explain and interpret and comprehend what forces itself on our attention as reality, or to demonstrate the position and the origin of these individual objects, and perhaps, for instance, to offer a deduction of matter, of evil; but rather to separate the mind from these externals, and give it its central place in the simple, clear Idea. The whole tenor of his philosophy thus leads up to virtue and to the intellectual contemplation of the eternal, as source of the same; so that the soul is brought to happiness of life therein. Plotinus then enters to some extent on special considerations of virtue, with the view of cleansing the soul from passions, from false and impure conceptions of evil and destiny, and also from incredulity and superstition, from astrology and magic and all their train. This gives some idea of the general drift of his teaching.

If we now go on to consider the philosophy of Plotinus in detail, we find that there is no longer any talk of the criterion, as with the Stoics and Epicureans, — that is all settled; but a strenuous effort is made to take up a position in the centre of things, in pure contemplation, in pure thought. Thus what with the Stoics and Epicureans is the aim, the unity of the soul with itself in untroubled peace, is here the point of departure; Plotinus takes up the position of bringing this to pass in himself as a condition of ecstasy (ἔκστασις), as he calls it, or as an inspiration. Partly in this name and partly in the facts themselves, a reason has been found for calling Plotinus a fanatic and visionary, and this is the cry universally raised against this philosophy; to this assertion the fact that for the Alexandrian school all truth

lies in reason and comprehension alone, presents a very marked antithesis and contradiction.

And firstly, with regard to the term ecstasy, those who call Plotinus a fanatic associate with the idea nothing but that condition into which crazy Indians, Brahmins, monks and nuns fall, when, in order to bring about an entire retreat into themselves, they seek to blot out from their minds all ordinary ideas and all perception of reality; thus this in some measure exists as a permanent and fixed condition; and again as a steady gaze into vacuity it appears as light or as darkness, devoid of motion, distinction, and, in a word, of thought. Fanaticism like this places truth in an existence which stands midway between reality and the Notion, but is neither the one nor the other, — and therefore only a creature of the imagination. From this view of ecstasy, however, Plotinus is far removed.

But in the second place there is something in the thing itself which has contributed to bring upon him this reproach, and it is this, that very often the name of fanaticism is given to anything that transcends sensuous consciousness or the fixed notions of the finite understanding, which in their limitation are held to constitute real existence. Partly, however, the imputation is due to the manner in which Plotinus speaks in general of Notions, spiritual moments as such, as if they had a substantial existence of their own. That is to say, Plotinus sometimes introduces sensuous modes, modes of ordinary conception, into the world of Notions, and sometimes he brings down Ideas into the sphere of the sensuous, since, for instance, he utilizes the necessary relations of things for purposes of magic. For the magician is just he who attributes to certain words and particular sensuous signs a universal efficacy, and who attempts by prayers, &c., to lift them up to the universal. Such a universal this is not, however, in itself, in its own nature: universality is only attributed to it; or the universal of thought has not yet given itself therein a universal reality, while the thought, the act of a

hero is the true, the universal, whose effects and whose means have equal greatness and universality. In a certain sense therefore the Neo-Platonists have well deserved the reproach of fanaticism, for in the biographies of the great teachers of this school, Plotinus, Porphyrius and Iamblichus we certainly find much recounted that comes under the category of miracle-working and sorcery, just as we found it in the case of Pythagoras (Vol. I. p. 200). Upholding as they did the belief in the gods of heathendom, they asserted in reference to the worship of images that these really were filled with the divine power and presence. Thus the Alexandrian school cannot be altogether absolved from the charge of superstition.[224] For in the whole of that period of the world's history, among Christians and heathen alike, the belief in miracle-working prevailed, because the mind, absorbed in itself and filled with astonishment at the infinite power and majesty of this self, paid no heed to the natural connection of events, and made the interference of a supreme power seem easy. But what the philosophers taught is utterly remote therefrom; except the quite theoretical observation regarding the images of the gods which we mentioned above, the writings of Plotinus contain nothing in any way related thereto.

He then who gives the name of fanaticism to every effort of the soul to rise to the supersensuous, to every belief that man can have in the virtuous, the noble, the divine, the eternal, to every religious conviction, — may count the Neo-Platonists as being fanatics; but fanaticism is in this case an empty name employed only by the dull finite understanding, and by unbelief in all that is high and noble. If we, however, give the name of fanatics to those who rise to speculative truths which contradict the categories of the finite understanding, the Alexandrians have indeed incurred this imputation, but with quite equal reason may the Platonic and Aristotelian philosophy be also termed fanaticism. For Plato most certainly speaks with enthusiasm of the elevation of the spirit into thought, or rather

the Platonic enthusiasm proper consists in rising into the sphere of the movement of thought. Those who are convinced that the absolute essence in thought is not thought itself, constantly reiterate that God is beyond consciousness, and that the thought of Him is the notion of One whose existence or reality is nevertheless an utterly different thing; just as, when we think of or imagine an animal or a stone, our notion or imagination is something quite different from the animal itself, — which is making this last to be the truth. But we are not speaking of this or that animal perceived by our senses, but of its essential reality, and this is the Notion of it. The essential reality of the animal is not present as such in the animal of our senses, but as being one with the objective individuality, as a mode of that universal; as essence it is our Notion, which indeed alone is true, whereas what the senses perceive is negative. Thus our Notion of absolute essence is the essence itself, when it is the Notion of absolute essence, not of something else. But this essence does not seem to be co-extensive with the idea of God; for He is not only Essence or His Notion, but His existence. His existence, as pure essence, is our thought of Him; but His real existence is Nature. In this real existence the 'I' is that which has the faculty of individual thought; it belongs to this existence as a moment present in it, but does not constitute it. From the existence of essence as essence we must pass over to existence, to real existence as such. As such, God is doubtless a Beyond to individual self-consciousness, that is to say, of course, in the capacity of essence or pure thought; thus to a certain extent He, as individual reality, is Nature which is beyond thought. But even this objective mode comes back into essence, or the individuality of consciousness is overcome. Therefore what has brought upon Plotinus the reproach of fanaticism is this, that he had the thought of the essence of God being Thought itself and present in Thought. As the Christians said that He was once present to sensuous perception at a certain time and in a certain

place — but also that He ever dwells in His people and is their Spirit — so Plotinus said that absolute essence is present in the self-consciousness that thinks, and exists in it as essence, or Thought itself is the Divine.

In further defining the relation of individual self-consciousness to the knowledge of absolute essence, Plotinus asserts (Ennead. VI. l. 7, c. 35, 36) that the soul which withdraws from the corporeal and loses every conception but that of pure essence brings itself nigh to the Deity. The principle of the philosophy of Plotinus is therefore the Reason which is in and for itself. The condition of ecstasy through which alone that which has true Being comes to be known, is named by Plotinus (Ennead. VI. l. 9, c. 11) a simplification of the soul, through which it is brought into a state of blissful repose, because its object is itself simple and at rest. But it is evident that we are not to imagine this simplification of self-consciousness to be a condition of fanaticism, seeing that even an immediate knowledge of God such as this is a thinking of Him and a comprehension of Him, and not a vacant feeling, or what is quite as vacant, an intuition. This withdrawal of the soul from the body takes place through pure thought; thought is the activity and at the same time the object. It is thus a tranquil state, without any wild turmoil of the blood or of the imagination. Ecstasy is not a mere rapturous condition of the senses and fancy, but rather a passing beyond the content of sensuous consciousness; it is pure thought that is at home with itself, and is its own object. Plotinus often speaks of this condition in the same way as in the following passage: "Often when I out of the body awaken to myself, and am beyond the other," the external, "and have entered into my inmost nature, and have a wondrous intuition, and live a godlike life," &c.[225] In this way Plotinus certainly approaches to the intuitive point of view. Yet his figurative mode of expression separates itself still more from the, in great measure, confused mythical ideas. The Idea of the philosophy of Plotinus is thus an intellectualism or a higher idealism,

which indeed from the side of the Notion is not yet a perfect idealism; that of which Plotinus becomes conscious in his ecstasy is, however, philosophic thought, speculative Notions and Ideas.

As for the determinate principle of Plotinus, the objective, the content, which is at home with itself in this ecstasy, in this Being of Thought — this content, as regards its chief moments in the universal, is that already dealt with. The three principles are for him the One, the νοῦς and the soul.

a. The first, the absolute, the basis, is here, as with Philo, pure Being, the unchangeable, which is the basis and the cause of all Being that appears, whose potentiality is not apart from its actuality, but is absolute actuality in itself. It is the unity which is likewise essence, or unity as the essence of all essence. The true principle is not the multiplicity of present Being, the ordinary substantiality of things, according to which each appears as one separated from the others, for really and truly their unity is their essence. This unity is, properly speaking, not All; for All is nothing but the result of the units, the comprehension of them — forming the basis, as they do, as essence — in a unity which is strange to them. Nor is it before all; for it is not different from the all in actual existence, since otherwise it would again be only something thought.[226] The later unity, as regulative of the Reason, has the force of a subjective principle; but Plotinus establishes it as the highest objectivity, as Being.

This unity has no multiplicity in it, or multiplicity is not implicit; unity is only as it was for Parmenides and Zeno, absolute, pure Being; or else the absolute Good, in the sense in which the absolute was spoken of in the writings of Plato and especially in those of Aristotle. In the first place, what is the Good?— “It is that on which all depends (ἀνήρτηται),[227] and which all things desire (ἐφίεται)” — also according to Aristotle— “and have as principle, and which they are all in want of, while itself it has lack of

nothing, is sufficient for itself, and is the measure and limit of all, which out of itself gives the νοῦς and essence (οὐσίαν) and soul and life, and the activity of reason (περὶ νοῦν ἐνήργειαν). And up to this point all is beautiful, but *it* is more than beautiful (ὑπέρκαλος) and better than the best (ἐπέκεινα τῶν ἀρίστων), the superlatively good, bearing free rule, exercising royal rights in Thought (βασιλεύων ἐν τῷ νοητῷ). But it is itself by no means that whose principle it is. For when thou hast said "the Good," add nothing thereto, and think of nothing beyond. When thou hast abrogated Being itself, and takest it in this wise, astonishment will seize thee; and, making this thy aim and resting therein, thou wilt understand it and its greatness by what is derived from it. And when thou hast Being thus before thee, and regardest it in this purity, wonder will lay hold of thee."[228]

Of absolute Being Plotinus then asserted that it is unknowable — which Philo also said — and that it remains in itself. On this point Plotinus expatiates at great length, and frequently recurs to the fact that the soul must really first attain to the thought of this unity through negative movement, which is something different from mere assertion, and is rather sceptical movement which makes trial of all predicates and finds nothing except this One. All such predicates as Being and substance do not conform to it in the opinion of Plotinus; for they express some determination or other. There is no sensation, no thought, no consciousness; for in all these there lies a distinction. Because the determination of the One is the main point, with Plotinus the Good is the aim for subjective thought as well as for practical; but although the Good is the absolutely free, it is nevertheless without resolution and will; for will has in it the distinction of itself and the Good.[229]

That Being is and remains God, and is not outside of Him, but is His very self: "Absolute unity upholds things that they fall not asunder; it is the firm bond of unity in all, penetrating all — bringing together and unifying things which in mutual opposition were in danger of separation. We term it

the One and the Good. It neither *is*, nor is it something, nor is it anything, but it is over all. All these categories are negatived; it has no magnitude, is not infinite. It is the middle point of the universe, the eternal source of virtue and the origin of divine love, around which all moves, by which every thing directs its course, in which νοῦς and self-consciousness ever have their beginning and their end."[230] To this substance Plotinus leads back everything; it alone is the true, and in all remains simply identical with itself.

But out of this First all proceeds, owing to its revealing itself; that is the connection with creation and all production. But the Absolute cannot be conceived as creative, if it is determinate as an abstract, and is not rather comprehended as the One which has energy in itself. This transition to the determinate is thus not made by Plotinus philosophically or dialectically, but the necessity of it is expressed in representations and images. Thus he says (Ennead. III. l. 8, c. 9) of the νοῦς, his second principle, "The one absolute Good is a source which has no other principle, but is the principle for all streams, so that it is not swallowed up by these, but as source remains at rest in itself," and thus contains these streams as such in itself; so that they, "flowing out in one direction and another, have yet not flowed away, but know whence and whither they are flowing." This distinction is the point to which Plotinus often returns, and this advance from the unrevealed to the revelation, this production, is a point of importance.

b. Now what is first begotten by this Unity, the Son, is finite understanding (νοῦς), the second Divine Being, the other principle. Here the main difficulty confronts us — the task known and recognized long years ago — the comprehension of how the One came to the decision to determine itself; and the endeavour to elucidate this fact still constitutes the essential point of interest. The ancients did not frame this question in the definite form in which we have it; but they nevertheless occupied

themselves with it. For the νοῦς is nothing more or less than the self-finding of self; it is the pure duality (δυάς), itself and its object; it contains all that is thought, it is this distinction, but pure distinction that remains at the same time identical with itself. Simple unity is, however, the First. Plotinus thus also says in a somewhat Pythagorean fashion that things are as numbers in this λόγος. "But number is not the First, for unity is not a number. The first number is the two, but as indeterminate duality; and the one is what determines it; the two is also the soul. Number is the solid; what sensuous perception takes to be existent, is a later development."[231]

Plotinus has here (Ennead. V. l. 1, c. 6) all sorts of modes of representation in order to make clear to himself the development out of the One: "How then this process is accomplished, how out of unity proceed two and plurality in general — if we would know how to express this, we must call on God, not, however, with audible voice, but pouring out our soul in prayer to Him; this we can do only by coming all alone to Him who is alone. He who contemplates must retire into his secret heart as into a temple, and remain there at rest, being elevated above all things, and in such contemplation as admits of no change." This is always the mood of the thinking soul, to which Plotinus exhorts and would lead everything back. In this pure thought or contemplation the νοῦς is actual; and this is divine activity itself.

Plotinus continues: "This production is not a movement nor a change; change and what comes to pass through change, the changeable, we arrive at only in the third place;" change implies other-Being and is directed to something else, νοῦς is still the remaining at home with self of meditation. "The finite understanding originating thus from absolute essence, yet without change, is the immediate reflection of the same; it is not established by an act of will or a resolution. But God," as One, the Good, "is the immovable; and production is a light proceeding from Him who endures.

The One sheds light round about Himself; the finite understanding flows from Him, the enduring one, just as the light from the sun encircles it. All things which are permanent give forth and diffuse from their substance an essence which is dependent upon them;" or, as Plotinus really says, it is identical with them. "As fire diffuses warmth, and snow cold, around itself, but especially as the fragrance of things clings round them," so does νοῦς, like light, diffuse Being around. "That which has come to perfection passes into the emanation, into the circle of light," spreads a fragrance around.[232] For this going forth (πρόοδον) or production, Plotinus also employs the image of overflowing, whereby, however, the One remains simply one. "Because it is complete in itself, without anything lacking, it overflows; and this overflow is what is produced. This that is produced merely, however, returns to the One," the Good, "which is its object, content and fulfilling; and this is finite understanding," — this the reversion of what is produced to the original unity. "The first state of Being that is restful is absolute essence, and finite understanding is the contemplation of this essence;" or it comes into existence by means of the first essence, through return upon itself, seeing itself, by its being a seeing seeing. The light shed around is a contemplation of the One; this reflection of self on self (ἐπιστρέφειν) is then thought, or the νοῦς is this movement in a circle (ἐπιστροφή).[233]

These are the main principles of Plotinus; and he has in this way truly determined the nature of the Idea in all its moments. Only there is a difficulty here which makes us pause; and it is found in this development. We can imagine the infinite disclosing itself in a variety of ways; in later times there has been much talk of an issuing-forth from God, which, however, is still a sensuous conception or something quite immediate. The necessity of self-disclosure is not expressed thereby, for it is stated only as something having come to pass. That the Father begets the eternal Son satisfies the imagination; the Idea is according to its content quite correctly

conceived as the Trinity, and this is an important matter. But although these determinations are true, the form of the immediacy of movement is at the same time neither sufficient nor satisfying for the Notion. For because the Becoming of the simple unity, as the abrogation of all predicates, is that same absolute negativity which is implicitly the production of itself, we must not begin with unity and only then pass over into duality, but we must grasp them both as one. For, according to Plotinus, the object of the finite understanding is clearly nothing which is alien or opposite to this or to itself; the manifold Ideas are alone the content of the same. God therefore through distinction and extension is likewise a return to Himself, that is, this very duality is simply in the unity, and is its object. What is thought is not outside of νοῦς in thought νοῦς merely possesses itself as thinking. The object of thought, that to which thought turns back, is absolute unity; into this, however, as such, there is no forcing a way, and it is not determined, but remains the unknown. Since thinking is, however, only the fact of having itself as object, it has thus already an object which contains mediation and activity, or, to speak generally, duality in itself. This is Thought as the thought of Thought. Or in the perfecting of this thought in itself, inasmuch as it is its own object, there lies for Plotinus the first and truly intellectual world, which thus stands to the world of sense in such a relation that the latter is only a distant imitation of the former. Things, looked at as they exist in this absolute Thought, are their own Notions and essence (λόγοι); and these are the patterns of sensuous existences, as Plato also expressed it.[234]

That the nature of thought is to think itself, is a quite Aristotelian definition. But with Plotinus and the Alexandrians it is likewise the case that the true universe, the intellectual worlds is produced from thought; what Plato termed the Ideas, is here the understanding that forms, the intelligence that produces, which is actual in that which is produced, and

has itself as object, thinks itself. Of the relation of these many Notions in the understanding, Plotinus states that they are present there, just as the elements are present in a thing, and therefore not as mutually indifferent species, but as being diverse and yet entirely one. They are not indifferent through space, but only differ through an inner difference, that is, not in the manner of existent parts.[235] The finite understanding is thereby expressed as negative unity. But it is utterly inappropriate when the relation of the elements which constitute a thing is defined as that of the parts of which the whole consists, and each of which is absolute — for instance, when it is represented that in a crystal, water, flint, &c., are still present as such. Their Being is really neutrality, in which each of them is abrogated as indifferent and existent: therefore their unity is negative unity, the inner essence, the principle of individuality as containing in itself elements that differ.

c. The world that changes, which is subject to difference, arises from this, that the multiplicity of these forms is not only implicitly in the understanding, but they also exist for it in the form of its object. Further, there is for it a three-fold mode of thinking: in the first place it thinks the unchangeable, its unity, as object. This first mode is the simple undifferentiated contemplation of its object, or it is light; not matter, but pure form, activity. Space is the abstract pure continuity of this activity of light, not the activity itself, but the form of its uninterruptedness. The understanding, as the thought of this light, is itself light, but light real in itself, or the light of light.[236] In the second place the understanding thinks the difference between itself and essence; the differentiated multiplicity of the existent is object for it. It is the creation of the world; in it everything has its determinate form in regard to everything else, and this constitutes the substance of things. Since, in the third place, substantiality or permanency in the faculty of thought is determination, its production, or the flowing out of all things from it, is of such a nature that it remains filled with all things,

or likewise absorbs all immediately. It is the abrogation of these differences, or the passing over from one to another; this is its manner of thinking itself, or it is object to itself in this fashion. This is change; thinking has thus the three principles in it. Inasmuch as νοῦς thinks of itself as changing, but yet in change remaining simple and at home with itself, the subject of its thought is life as a whole; and the fact of its establishing its moments as existing in opposition to each other is the true, living universe. This turning round on itself of the outflow from itself, this thinking of itself, is the eternal creation of the world.[237] It is plain that in these thoughts of Plotinus the Being-another, the foreign element, is abrogated, existent things are implicitly Notions. The Divine understanding is the thinking of them, and their existence is nothing else than this very fact of their being the object of thought of the Divine understanding; they are moments of thought and, for this very reason, of Being. Plotinus thus distinguishes in νοῦς thinking (νοῦς), the object thought of (νοητόν), and thought (νόησις), so that νοῦς is one, and at the same time all; but thought is the unity of what had been distinguished.[238] We would term thought not so much unity as product; yet even thought, that is, the subject, soars upwards to God. The distinction between thought and an external God is thus doubtless at an end; for this reason the Neo-Platonists are accused of being visionaries, and in truth they do themselves propound wondrous things.

α. Plotinus now goes on to describe the third principle, the soul: "Νοῦς is eternally active in exactly the same way as now. The movement to it and around it is the activity of the soul. Reason (λόγος), which passes from it to the soul, confers on the soul a power of thought, placing nothing between them. Thinking (νοῦς) is not a manifold; thinking is simple, and consists in the very fact of thinking. The true νοῦς (not ours, as it is found, for instance, in desire) thinks in thoughts, and the object of its thought is not beyond it; for it is itself the object of its thought, has of necessity itself in thought and

sees itself; and sees itself not as non-thinking, but as thinking. Our soul is partly in the eternal" (light), "a part of the universal soul; this itself is in part in the eternal, and flows out thence, remaining in contemplation of itself, without any designed regulation. The embellishment of the whole gives to every corporeal object what in view of its determination and nature it is capable of carrying out, just as a central fire diffuses warmth all around it. The One must not be solitary, for were it so all things would be hidden, and would have no form present in them; nothing of what exists would exist if the One stood by itself, neither would there be the multitude of existent things, produced by the One, if those who have attained to the order of souls had not received the power to go forth. Similarly souls must not exist alone, as if what is produced through them should not appear, for in every nature it is immanent to make and bring to light something in conformity with itself, as the seed does from an undivided beginning. There is nothing to prevent all from having a share in the nature of the Good."[239] Plotinus leaves the corporeal and sensuous on one side, as it were, and does not take pains to explain it, his sole and constant aim being to purify therefrom, in order that the universal soul and our soul may not be thereby endangered.

β. Plotinus speaks, moreover, of the principle of the sensuous world, which is matter, and with which the origin of evil is closely connected. He dwells much on this subject of matter in his philosophy. Matter is the non-existent (οὖκ ὄν), which presents an image of the existent. Things differ in their pure form, the difference that distinguishes them; the universal of difference is the negative, and this is matter. As Being is the first absolute unity, this unity of the objective is the pure negative; it lacks all predicates and properties, figure, &c. It is thus itself a thought or pure Notion, and indeed the Notion of pure indeterminateness; or it is universal potentiality without energy. Plotinus describes this pure potentiality very well, and defines it as the negative principle. He says, "Brass is a statue only in

potentiality; for in what is not permanent, the possible, as we have seen, was something utterly different. But when the grammarian in potentiality becomes the grammarian in actuality, the potential is the same as the actual. The ignorant man may be a grammarian, as it were by accident (κατὰ συμβεβηκός), and it is not in virtue of his present ignorance that he has the possibility of knowledge. It is for the very reason of its possessing a certain measure of knowledge that the soul which is actual attains to what it was potentially. It would not be inappropriate to give the name of form and idea to energy, in so far as it exists as energy and not as mere potentiality — not simply as energy, but as the energy of something determinate. For we might give the name more properly, perhaps, to another energy, namely that which is opposed to the potentiality which leads to actuality, for the possible has the possibility of being something else in actuality. But through possibility the possible has also in itself actuality, just as skill has the activity related thereto, and as bravery has brave action. When in the object of thought (ἐν τοῖς νοηντοῖς)[240] there is no matter, — as in the case of something existing in potentiality — and it does not become something that does not yet exist, nor something that changes into something else, nor something that — itself permanent — produces another, or emerging from itself permits another to exist in its place — in that case we have then no mere potential but the existent, which has eternity and not time. Should we consider matter to be there as form, as even the soul, although a form, is matter in respect to what is different? But, speaking generally, matter is not in actuality, it is what exists in potentiality. Its Being only announces a Becoming, so that its Being has always to do with future Being. That which is in potentiality is thus not something, but everything;" energy alone is determinate. "Matter consequently always leans towards something else, or is a potentiality for what follows; it is left behind as a feeble and dim image that cannot take shape. Is it then an image in respect to reality, and therefore a deception?

This is the same as a true deception, this is the true non-existent;" it is untrue by reason of energy. "That is therefore not existent in actuality which has its truth in the non-existent;" it exists not in truth, for "it has its Being in non-Being. If you take away from the false its falseness, you take away all the existence that it has. Similarly, if you introduce actuality into that which has its Being and its essence in potentiality, you destroy the cause of its substance (ὑποστάσεως), because Being consisted for it in potentiality. If we would therefore retain matter uninjured, we must keep it as matter; apparently we must therefore say that it is only in potentiality, in order that it may remain what it is."[241]

In accordance with this, therefore, Plotinus (Ennead. III. l. 6, c. 7, 8) defines it: "Matter is truly non-existent, a motion which abrogates itself, absolute unrest, yet itself at rest — what is opposed in itself; it is the great which is small, the small which is great, the more which is less, the less which is more. When defined in one mode, it is really rather the opposite; that is to say, when looked at and fixed, it is not fixed and escapes, or when not fixed it is fixed — the simply illusory." Matter itself is therefore imperishable; there is nothing into which it can change. The Idea of change is itself imperishable, but what is implied in this Idea is changeable. This matter is nevertheless not without form; and we have seen that the finite understanding has a third relationship to its object, namely in reference to differences. As now this relation and alteration, this transition, is the life of the universe, the universal soul of the same, its Being is in like manner not a change which takes place in the understanding, for its Being is its being the immediate object of thought through the understanding.

γ. The Evil likewise, as contrasted with the Good, now begins to be the object of consideration, for the question of the origin of evil must always be a matter of interest to the human consciousness. These Alexandrians set up as matter the negative of thought, but since the consciousness of the

concrete mind entered in, the abstract negative is apprehended in this concrete fashion as within the mind itself, therefore as the mentally negative. Plotinus regards this question of evil from many sides; but thoughtful consideration of this subject does not yet go very far. The following conceptions are those that prevail at this time: "The Good is νοῦς, but not the understanding in the sense it used to bear for us, which from a pre-supposition both satisfies itself and understands what is said to it, which forms a conclusion and from what follows draws up a theory, and from the consequence comes to a knowledge of what is, having now obtained something not formerly possessed; for before this its knowledge was empty, although it was understanding. But νοῦς, as we now understand it, contains all things in itself, is all things, and is at home with itself; it has all things while not having them," because it is in itself ideal. "But it does not possess all in the sense in which we regard what we possess as something different or alien from ourselves; what is possessed is not distinguished from itself. For it is each thing and everything and not confounded, but absolute. What partakes of the same does not partake of all things at once, but partakes in so far as it can. Νοῦς is the first energy and the first substance of the soul, which has activity in regard thereto. The soul, externally revolving round νοῦς, contemplating it and gazing into its depths, beholds God by means of it; and this is the life of the gods, free from evil and filled with blessedness" — in so far as the intelligence which goes forth from itself has in its difference to do only with itself, and remains in its divine unity. "If it remained thus constant there would be no evil. But there are goods of the first and second and third rank, all surrounding the King over all; and He is the originator of all good, and all is His, and those of the second rank revolve round the second, and those of the third round the third. If this is the existent and something even higher than the existent, evil is not included in what is existent or higher than the existent; for this is the good. Nothing

remains then but that evil, if it exists, is in the non-existent, as a form of the non-existent — but the non-existent not as altogether non-existent, but only as something other than the existent.” Evil is no absolute principle independent of God, as the Manichæans held it to be. “It is not non-existent in the same way that motion and rest are existent, but is like an image of the existent, or non-existent in an even greater degree; it is the sensuous universe.”[242]. Thus evil has its root in the non-existent.

In the eighth book of the first Ennead Plotinus says (c. 9, 3, 4, 7): “But how is evil recognized? It is owing to thought turning away from itself that matter arises; it exists only through the abstraction of what is other than itself. What remains behind when we take away the Ideas is, we say, matter; thought accordingly becomes different, the opposite of thought, since it dares to direct itself on that which is not within its province. Like the eye turning away from the light in order to see the darkness which in the light it does not see — and this is a seeing which yet is non-seeing — so thought experiences the opposite of what it is, in order that it may see what is opposed to itself.” This abstract other is nothing but matter, and it is also evil; the seeing of the less measure is nothing but a non-seeing. “The sensuous in regard to measure, or the limited, is the less measure, the boundless, the undefined, unresting, insatiable, the utterly deficient; such is not accidental to it, but its substance.” Its aim is always Becoming; we cannot say that it is, but only that it is always about to be. “The soul which makes νοῦς its aim is pure, holds off matter and all that is indeterminate and measureless. But why then, when there is the Good, is there also necessarily Evil? Because there must be matter in the whole, because the whole necessarily consists of opposites. It would not be there, if matter were not present; the nature of the world is compounded of νοῦς and necessity. To be with the gods means to be in thought; for they are immortal. We may also apprehend the necessity of evil in this wise: As the Good cannot exist alone,

matter is a counterpart to the Good, necessary to its production. Or we might also say that Evil is that which by reason of constant deterioration and decay has sunk until it can sink no lower; but something is necessary after the first, so that the extreme is also necessary. But that is matter, which has no longer any element of good in it; and this is the necessity of evil."

With Plotinus, as with Pythagoras, the leading of the soul to virtue is also an important subject. Plotinus has for this reason blamed the Gnostics frequently, especially in the ninth book of the second Ennead (c. 15), because "they make no mention at all of virtue and the Good, nor of how they may be reached, and the soul rendered better and purer. For no purpose is served by saying,[243] 'Look unto God;' it must also be shown how we can succeed in causing man thus to behold God. For it may be asked, What is to prevent a man from beholding, while at the same time he refrains from the gratification of no desire, and allows anger to take possession of him? Virtue, which sets a final end before itself and dwells in the soul with wisdom, manifests God; but without true virtue God is an empty word." The Gnostics limit truth to the mental and intellectual; to this mere intellectuality Plotinus declares himself distinctly opposed, and holds firmly to the essential connection of the intelligible and the real. Plotinus honoured the heathen gods, attributing to them a deep meaning and a profound efficacy. He says in the same treatise (c. 16), "It is not by despising the world and the gods in it, and all else that is beautiful, that man attains to goodness. The wicked man holds the gods in contempt, and it is only when he has completely reached this stage that he becomes utterly depraved. The above-mentioned reverence of the Gnostics for the intelligible gods (νοητοὺς θεούς) is nothing corresponding with this (ἀσυμπαθὴς ἂν γένοιτο):" that is to say, there is no harmony between thoughts and the real world, when one does not go beyond the object of thought. "He who loves anything loves also all things related to the same, therefore also the children

of the father whom he loves. Every soul is the daughter of this father. But souls in the heavenly spheres are more intelligible, and better, and far more nearly related to the higher Power than our souls are. For how could this world of reality be cut off from that higher sphere? Those who despise that which is related thereto know it only in name. How could it be pious to believe that Divine providence (πρόνοια) does not reach to matters here below? Why is God not also here? For how otherwise could He know what takes place within this sphere? Therefore He is universally present, and is in this world, in whatever way it be, so that the world participates in Him. If He is at a distance from the world, He is at a distance also from us, and you could say nothing of Him or of what He produces. This world also partakes of Him, and is not forsaken by Him, and never will be so. For the whole partakes of the divine much more than the part does, and the world-soul shares in it to a still greater degree. The Being and the rationality of the world are a proof of this."

In this we have the main ideas on which the intellectualism of Plotinus is based, the general conceptions to which everything particular is led back; the instances in which this is done are often, however, figurative. What, in the first place, is lacking in them, as we have already remarked, is the Notion. Severance, emanation, effluence or process, emergence, occurrence, are words which in modern times have also had to stand for much, but in fact nothing is expressed by them. Scepticism and dogmatism, as consciousness or knowledge, establish the opposition of subjectivity and objectivity. Plotinus has rejected it, has soared upwards into the highest region, into the Aristotelian thought of Thought; he has much more in common with Aristotle than with Plato, and thereby he is not dialectic, nor does he proceed out of himself, nor as consciousness does he go back out of himself into himself again. With this, in the second place, there is connected the fact that the further descent either to nature or to manifested

consciousness, even when expressed as the operation of the higher soul, yet contains much that is arbitrary, and is devoid of the necessity of the Notion; for that which ought to be defined in Notions is expressed in many-coloured pictures, in the form of a reality; and this, to say the least, is a useless and inadequate expression. I quote one example only: our soul belongs not only to the sphere of the finite understanding, where it was perfect, happy, lacking nothing; its power of thought alone belongs to the first, the finite understanding. Its power of motion, or itself looked on as life, had as its source the intelligent world-soul, but sensation had its source in the soul of the world of sensation. That is to say, Plotinus makes the first world-soul to be the immediate activity of the finite understanding, which is an object to itself; it is pure soul above the sublunar region, and dwells in the upper heaven of the fixed stars. This world-soul has power to originate; from it again there flows an entirely sensuous soul. The desire of the individual and particular soul separated from the whole gives it a body; this it receives in the higher region of the heavens. With this body it obtains fancy and memory. At last it repairs to the soul of the sensible world; and from this it acquires sensation, desires, and the life that is vegetative in nature.[244]

This declension, this further step towards the corporeality of the soul, is described by the followers of Plotinus as if the soul sank from the Milky Way and the Zodiac into the orbits of planets which have their place lower down, and in each of these it receives new powers, and in each begins also to exercise these powers. In Saturn the soul first acquires the power of forming conclusions with regard to things; in Jupiter it receives the power of effectiveness of the will; in Mars, affections and impulses; in the Sun, sensation, opinion, and imagination; in Venus, sensuous desires aiming at the particular; in the Moon, lastly, the power of production.[245] In such a way as this Plotinus makes into a particular existence for the spiritual the very things that he declares to be, on the one hand, intelligible moments. The

soul which only has desires is the beast; that which only vegetates, which has only power of reproduction, is the plant. But what we spoke of above are not particular conditions of mind, outside of the universal spirit, in the world-spirit's particular stages of its self-consciousness regarding itself; and Saturn and Jupiter have nothing further to do with it. When they in their potency are expressed as moments of the soul, this is not a whit better than when each of them was supposed to express a particular metal. As Saturn expresses lead, Jupiter tin, and so forth, so Saturn also expresses argumentation, Jupiter will, &c. It is doubtless easier to say that Saturn corresponds with lead, &c., that it is the power of drawing conclusions, or that it represents lead and the power of drawing conclusions, or anything else you like, instead of expressing its Notion, its essence. The above is a comparison with a thing that in like manner does not express a Notion, but is apparent to the senses, which is laid hold of out of the air, or rather indeed from the ground. Such representations are warped and false; for if we say that this is lead, we mean thereby the essence or the implicitness of lead, with which the soul has an affinity; but this is no longer the sensuous Being which is known as lead, nor has this moment of such a state any reality for the soul.

3. Porphyry and Iamblichus.

Porphyry and Iamblichus, who have already been mentioned as the biographers of Pythagoras (Vol. I. p. 197), are distinguished followers of Plotinus. The first, a Syrian, died in 304: the latter, likewise of Syria, in the year 333.[246] Amongst other works by Porphyrius, we possess an "Introduction to the Organon of Aristotle on Genera, Species, and Judgments," in which his logic is propounded in its principal elements. This work is one which has at all times been the text-book of Aristotelian Logic, and also an authority from which the knowledge of its form has been

derived; and our ordinary books of logic contain little more than what is found in this Introduction. The fact that Porphyry devoted himself to logic shows that a determinate form of thought was coming into favour with the Neo-Platonists; but this is something pertaining altogether to the understanding and very formal. Thus we here have the characteristic fact that with the Neo-Platonists the logic of the understanding, the quite empiric treatment of the sciences, is found in conjunction with the entirely speculative Idea, and in respect of practical life with a belief in theurgy, the marvellous and strange: in his life of Plotinus, Porphyry, indeed, describes him a miracle-worker, which statement we, however, must set aside as appertaining to literature.

Iamblichus evinces more mistiness and confusion still; he certainly was a teacher highly esteemed in his time, so that he even received the name of divine instructor; but his philosophic writings form a compilation without much specially to characterize them, and his biography of Pythagoras does not do much credit to his understanding. It was likewise in the Pythagorean philosophy that the Neo-Platonists gloried, and more particularly they revived the form of number-determination which pertains to it. In Iamblichus thought sinks into imagination, the intellectual universe to a kingdom of demons and angels with a classification of the same, and speculation comes down to the methods of magic. The Neo-Platonists called this theurgy (θεουργία); for in the miracle speculation, the divine Idea, is, so to speak, brought into immediate contact with actuality, and not set forth in a universal way. As to the work *De mysteriis Ægyptiorum*, it is not known for certain whether it had Iamblichus as its author or not; later on Proclus makes great ado concerning him, and testifies that he was indebted to Iamblichus for his main ideas.[247]

4. Proclus.

Proclus, a later Neo-Platonist who has still to be mentioned, is more important. He was born in 412 at Constantinople, but carried on his studies and spent most of his life with Plutarchus in Athens, where he also died in 485. His life is written by Marinus, in a style similar to that of the biographies just mentioned. According to this his parents came from Xanthus in Lycia, a district of Asia Minor; and since Apollo and Minerva were the tutelary deities of this town, he rendered grateful worship to them. They, themselves, vouchsafed to him, as their favourite, particular regard and personal manifestations; indeed, he was healed of an illness by Apollo touching his head; by Minerva, however, he was called upon to go to Athens. First of all he went to Alexandria to study rhetoric and philosophy, and then to Athens, to be with Plutarchus and Syrianus, the Platonists. Here he first studied Aristotelian and then Platonic philosophy. Above all the daughter of Plutarchus, Asclepigenia, initiated him into the profound secrets of philosophy; she, as Marinus assures us, was the only individual at that time who retained the knowledge, transmitted to her by her father, of the mystic ceremonies and of the whole theurgic discipline. Proclus studied everything pertaining to the mysteries, the Orphic hymns, the writings of Hermes, and religious institutions of every kind, so that, wherever he went, he understood the ceremonies of the pagan worship better than the priests who were placed there for the purpose of performing them. Proclus is said to have had himself initiated into all the pagan mysteries. He himself kept all the religious festivals and observances pertaining to nations the most various; he was even familiar with the Egyptian form of worship, observed the Egyptian days of purification and festivals, and spent certain fast days in offering up prayers and praise. Proclus himself composed many hymns — of which we still possess some that are very beautiful — both in honour of the better known divinities and of those whose fame is entirely local. Of the circumstance that he— “the most God-fearing man” — had dealings with

so many religions, he himself says: “It is not fitting for a philosopher to be minister (θεραπευτήν) to the worship of one town or of what pertains to the few, for he should be the universal hierophant of the whole world.” He considered Orpheus to be the originator of all Greek theology, and set a specially high value on the Orphic and Chaldaic oracles. It was in Athens that he taught. Of course his biographer, Marinus, relates the most marvellous things about him, that he brought down rain from heaven and tempered great heat, that he stilled the earthquake, healed diseases, and beheld visions of the divine.[248]

Proclus led a most intellectual life; he was a profoundly speculative man, and the scope of his knowledge was very great. In his case, as also in that of Plotinus, the contrast between the insight of such philosophers and what their disciples relate of them in biographies, must strike one very forcibly, for of the wonders described by the biographers few traces are to be found in the works of the subjects themselves. Proclus left behind him a great number of writings, many of which we now possess; he was the author of several mathematical works which we also have, such as that on the Sphere. His more important philosophic works are the Commentaries on Plato’s Dialogues, certain of which have been published from time to time; that on the Timæus was the most famous. But several were only found in manuscript, and of these Cousin issued in Paris the Commentaries on the Alcibiades (Vols. II. III.), and the Parmenides (Vols. IV.-VI.) for the first time. The first volume of Cousin’s edition contains some writings by Proclus which now exist only in Latin, on Freedom, Providence, and Evil. Works separately published are his important writings, The Platonic Theology (εἰς τὲν Πλάτωνος θεολογίαν) and his Theological Elements (συοιχείωσις θεολογική); the latter short work Creuzer has had re-published, as also some of the before-mentioned Commentaries.

Proclus lived, so to speak, in the worship of science. We cannot fail to see in him great profundity of perception, and greater capacity for working a matter out and clearness of expression than are found in Plotinus; scientific development also advanced with him, and on the whole he possesses an excellent manner of expression. His philosophy, like that of Plotinus, has the form of a Commentary on Plato; his book "On the Theology of Plato," is in this respect his most interesting work. The main ideas of his philosophy may easily be recognized from this work, which possesses many difficulties for this reason in particular, that in it the pagan gods are considered, and philosophic significations derived from them. But he distinguishes himself entirely from Plotinus by the fact that with him the Neo-Platonic philosophy, as a whole, has at least reached a more systematic order, and also a more developed form; thus in his Platonic theology especially (dialectic as the work undoubtedly is) a more distinct progression and distinction between the spheres in the Idea is to be found, than is noticeable in Plotinus. His philosophy is an intellectual system; we must see how we can work it out. His way of putting it is not perfectly clear, but leaves much to be desired.

Proclus differs first of all from Plotinus in not making Being his principle or purely abstract moment, but by beginning from unity, and for the first time understanding Being or subsistence as the third; thus to him everything has a much more concrete form. But the self-development of this unity is not made the necessity of the Notion with Proclus any more than with Plotinus; we must once for all give up seeking here for the Notion of disunion. Proclus (Theol. Plat. II. p. 95) says, "The one is in itself inexpressible and unknowable; but it is comprehended from its issuing forth and retiring into itself." Proclus in the same place (pp. 107, 108) defines this self-differentiation, the first characteristic of unity, as a production (παράγειν), a going forth (πρόοδος), and also as a representation or

demonstration. The relation to difference of the unity which brings forth is, however, not an issuing forth from self, for an issuing forth would be a change, and unity would be posited as no more self-identical. Hence through its bringing forth unity suffers no loss or diminution, for it is the thought that suffers no deterioration through the creation of a determinate thought, but remains the same, and also receives what is brought forth into itself.[249] As far as this goes, the Notion is, properly speaking, no clearer than with Plotinus.

What distinguishes Plotinus is his more profound study of the Platonic dialectic; in this way he occupies himself in his Platonic theology with the most acute and far-reaching dialectic of the One. It is necessary for him to demonstrate the many as one and the one as many, to show forth the forms which the One adopts. But it is a dialectic which to a greater or less extent is externally worked out, and which is most wearisome. But while with Plato these pure notions of unity, multiplicity, Being, &c., appear naturally, and so to speak devoid of other significance than that which they immediately possess (for we designate them as universal ideas which are present in our thought), with Proclus they have another and higher meaning; and hence it comes to pass that, as we have seen (pp. 59, 60), he found in the apparently negative result of the Platonic Parmenides the nature of absolute existence particularly and expressly recognized. Proclus now shows, according to the Platonic dialectic, how all determinations, and particularly that of multiplicity, are resolved into themselves and return into unity. What to the conceiving consciousness is one of its most important truths — that many substances exist, or that the many things, each of which is termed a one, and hence substance, exist in truth in themselves — is lost in this dialectic, and the result ensues that only unity is true existence, all other determinations are merely vanishing magnitudes, merely moments, and thus their Being is only an immediate thought. But since we now

ascribe no substantiality, no proper Being to a thought, all such determinations are only moments of a thing in thought. The objection at this point made and constantly maintained against the Neo-Platonists and Proclus is this, that certainly for thought everything goes back within unity, but that this is a logical unity alone, a unity of thought and not of actuality, and that consequently there can be no arguing from the formal to actuality. From this they say it by no means follows that all actual things are not actual substances, that they have not different principles independent of one another, and even that they are not different substances, each of which is separated from the other and in and for itself. That is to say, this contradiction always begins the whole matter over again when it says of actuality that it is something implicit, for those who do this call actuality a thing, a substance, a one — which last are merely thoughts; in short they always again bring forward, as something implicitly existent, that whose disappearance or non-implicitude has been already demonstrated.

But in this regard Proclus displays great sagacity in a remark he makes on the manner in which this mode of production appears in the Parmenides of Plato, who shows in a negative way in this Dialogue that if the existence of unity is affirmed, the existence of multiplicity, &c., must be denied. Respecting these negations (ἀποφάσεις) Proclus now says (Theol. Plat. II. pp. 108, 109) that they do not signify an abrogation of the content (στερητικαὶ τῶν ὑποκειμένων) of which they are predicated, but are the creation of determinatives in accordance with their opposites (γεννητικαὶ τῶν οἷον ἀντικειμένων). "Thus if Plato shows that the first is not many, this has the significance that the many proceed from the first; if he shows that it is not a whole, it proves that the fact of being a whole proceeds from it. The mode (τρόπος) of negations is thus to be taken as perfection which remains in unity, issues forth from everything, and is in an inexpressible and ineffable preponderance of simplicity. On the other hand, God must

likewise be derived from these negations; else there would be no Notion (λόγος) of them, and also no negation. The Notion of the inexpressible revolves round itself, never resting, and it strives with itself;" *i.e.* the one implies its determinations ideally, the whole is contained in the one. Multiplicity is not taken empirically and then merely abrogated; the negative, as dividing, producing, and active, not merely contains what is privative, but also affirmative determinations. In this way the Platonic dialectic wins for Proclus a positive significance; through dialectic he would lead all differences back to unity. With this dialectic of the one and many Proclus makes much ado, more especially in his famous elementary doctrines. The submersion of everything in unity remains, however, merely beyond this unity, instead of which this very negativity must really be grasped as signifying its production.

That which brings forth, according to Proclus, furthermore brings forth through a superfluity of power. There certainly also is a bringing forth through want; all need, all desire, for example, becomes cause through want; and its bringing forth is its satisfaction. The end here is incomplete, and the energy arises from the endeavour to complete itself, so that only in production the need becomes less, the desire ceases to be such, or its abstract Being-for-self disappears. Unity, on the other hand, goes forth out of itself through the superfluity of potentiality, and this superabundant potentiality is actuality generally: this reflection of Proclus is quite Aristotelian. Hence the coming forth of the unity consists in the fact that it multiplies itself, pure number comes forth; but this multiplication does not negate or diminish that first unity, but rather takes place in the method of unity (ἑνιαίως). The many partakes of the unity, but the unity does not partake of multiplicity.[250] The absolute unity which multiplies itself into many ones has consequently generated multiplicity as it is in these ones. Proclus makes use of a many-sided dialectic to show that the many does not

exist in itself, is not the creator of the many, that everything goes back into unity, and thus unity is also the originator of the many. It is, however, not made clear how this is the negative relation of the one to itself; what we see is then a manifold dialectic, which merely passes backwards and forwards over the relationship of the one to the many.

To Proclus an important characteristic of this progression is the fact that it takes place through analogy, and what is dissimilar to the truth is the further removed from the same. The many partakes of unity, but it is in a measure likewise not one, but dissimilar to one. But since the many is also similar to what produces it, it likewise has unity as its essence; hence the many are independent unities (ἑνάδες). They contain the principle of unity within themselves, for if as being many they are likewise different, they are, so to speak, only many for a third, being in and for themselves unities. These unities again beget others which must, however, be less perfect, for the effect is not exactly like the cause, that which is brought forth is not quite similar to what brings it forth. These next unities are wholes, *i.e.*, they are no longer real unities, unities in themselves, since in them the unity is only an accident. But because things themselves are in their synthetic nature merely wholes because their souls bind them together, they are dissimilar to the first unity, and cannot be immediately united to it. The abstractly conceived multiplicity is thus their mean; multiplicity is analogous to absolute unity, and is that which unites unity with the whole universe. Pure multiplicity makes the different elements like one another, and hence unites them to unity; but things only have similarity to unity. Thus things that are begotten ever remove themselves more and more from unity, and partake of it less and less.[251]

The further determination of the Idea is known as the trinity (τριάς). Of this Proclus (Theol. Plat. III. p. 140) first of all gives the abstract definition that its three forms are three gods, and now we have more especially to find

out how he defined the trinity. This trinity is certainly interesting in the Neo-Platonists, but it is specially so in the case of Proclus, because he did not leave it in its abstract moments. For he again considers these three abstract determinations of the absolute, each on its own account, as a totality of triunity, whereby he obtains one real trinity. Thus in the whole there are three spheres, separated from one another, which constitute the totality, but in such a way that each has again to be considered as complete and concrete in itself; and this must be acknowledged as a perfectly correct point of view which has been reached. Because each of these differences in the Idea, as remaining in unity with itself, is really again the whole of these moments, there are different orders in production; and the whole is the process of the three totalities establishing themselves in one another as identical. It will be shown directly which orders these are, and Proclus occupies himself much with these, because he tries to demonstrate the different powers again in them. Proclus is hence much more detailed, and he went much further than did Plotinus; it may indeed be said that in this respect we find in him the most excellent and best that was formulated by any of the Neo-Platonists.

As regards the further details of his trinity there are, according to his account, three abstract moments present in it, which are worked out in his Platonic theology — the one, the infinite and the limitation; the last two we have likewise seen in Plato (p. 68). The first, God, is just the absolute unity already frequently discussed, which by itself is unknowable and undisclosed, because it is a mere abstraction; it can only be known that it is an abstraction, since it is not yet activity. This unity is the super-substantial (ὑπερούσιον), and in the second place its first production is the many ones (ἑνάδες) of things, pure numbers. In these we have the thinking principles of things, through which they partake of absolute unity; but each partakes of it only through a single individual unity, through the one, while souls do so

through thought-out, universal unities. To this Proclus refers the forms of ancient mythology. That is to say, as he calls that first unity God, he calls these numerous unities of thought that flow from it, gods, but the following moments are likewise so called. He says, (Institut. theol. c. 162): "The gods are named in accordance with what depends upon the orders (τάξεων); hence it is possible to know from this their unknowable substances, which constitute their determinate nature. For everything divine is inexpressible on its own account and unknowable as forming part of the inexpressible one; but from differentiation, from change, it comes to pass that we know its characteristics. Thus there are gods capable of being known, which radiate true Being; hence true Being is the knowable divine, and the incommunicable is made manifest for the νοῦς." But there always remains a compulsion to represent mythology in the determinateness of the Notion. These gods or unities do not correspond to the order of things in such a way that there are just as many and such unities (ἑνάδες) or gods as there are things; for these unities only unite things with the absolute unity. The third is just the limit which holds these unities (ἑνάδες) together, and constitutes their unity with the absolute unity; the limit asserts the unity of the many and the one.[252]

This is better expressed by what follows, in which Proclus takes up the three fundamental principles — the limit, the infinite and what is mingled — of Plato's Philebus, because the opposition is thus more clearly determined; and therefore these appear to be the original gods. But to such abstractions the name gods is not applicable, for it is as returning that we first of all see them as divine. Proclus says (Theol. Plat. III. pp. 133-134): "From that first limit (πέρας)," the absolute one, "things have (ἐξέρτηται) union, entirety and community," the principle of individuality, "and divine measure. All separation and fertility and what makes for multiplicity, on the contrary, rest on the first infinitude (ἄπειρον);" the infinite is thus quantity,

the indeterminate, just as Plato in the Philebus calls the infinite the evil, and pleasure the untrue, because no reason is present in it (pp. 68, 69). "Hence when we speak of the process of anything divine, it is implied that in the individuals it remains steadfastly one, and only progresses towards infinitude," continuity as self-production, "and has at the same time the one and multiplicity present in it — the former from the principle of limitation, and the latter from the principle of infinitude. In all opposition which is found in species that are divine, what is more excellent belongs to limitation, and what is less excellent to the infinite. From these two principles everything derives its progress until it steps forth into Being. Thus the eternal, in so far as it is measure as intellectual, partakes of limitation, but in so far as it is the cause of unceasing effort after Being, of infinitude. Thus the understanding in so far as it has the standard (ραραδειγματικὰ μέτρα) within it, is a product of limitation; in so far as it eternally produces everything, it has undiminished capacity for infinitude." Multiplicity as Notion, not as the many, is itself unity; it is duality, or the determinateness which stands over against indeterminateness. Now according to Proclus (Theol. Plat. III. p. 137) the third is a whole, the unity of determinate and indeterminate, or that which is mingled (μικτόν). "This is first of all everything existent, a monad of many possibilities, a completed reality, a many in one (ἓν πολλά)." The expression "mingled" is not very suitable, is indeed faulty, because mixture at first expresses only an external union, while here the concrete, the unity of opposites, and even more the subjective, is properly speaking indicated.

Now if we consider further the nature of what is mingled we find the three triads likewise, for each of those three abstract principles is itself a similar complete triad, but under one or these particular forms. Proclus says (Theol. Plat. III. p. 135); "The first Being (τὸ πρώτως ὄν) is the mingled, the unity of the triad with itself; it is the Being of the life as well as of the

understanding. The first of what is mingled is the first of all existence, the life and the spirit are the two other orders; everything is consequently in triads. These three triads determine themselves thus as absolute Being, life and spirit; and they are spiritual and to be grasped in thought." According to this only the intelligible world is true for Proclus. But that Proclus did not make the understanding proceed immediately from the unity, is the second point in which he differs from Plotinus; in this Proclus is more logical, and he follows Plato more closely. His sequence is excellent, and he is right in placing the understanding, as the richer, last, since it is not until after the development of the moments which are present in life that the understanding springs forth, and from it in turn the soul.[253] Proclus says (Theol. Plat. I. pp. 21, 22, 28) that certainly in the first unity all agree, but that Plotinus makes the thinking nature appear just after the unity; yet the instructor of Proclus, who led him into all divine truth, limited better this indefinite way of looking at things adopted by the ancients, and differentiated this disorderly confusion of various orders into a comprehensible plan, and succeeded in satisfactorily following and maintaining the distinction of determinations. As a matter of fact we find more distinction and clearness in Proclus than in the turbidity of Plotinus; he is quite correct in recognizing the νοῦς as the third, for it is, that which turns back.

Regarding the relationship of the three orders Proclus now expresses himself in the passage already quoted (Theol. Plat. III. pp. 135-136) thus: "These three are themselves really contained in the existent, for in it is substance, life, the νοῦς and[254] what is the culminating point of all existence (ἀκρότης τῶν ὄντων)," the individuality of the self, the existent on its own account, the subjective, the point of negative unity. "The life that is grasped by thought is the very centre-point of existence. But the understanding is the limit of the existent, and it is thought as known (ὁ νοητὸς νοῦς), for in

what is thought is thinking, and in thinking what is thought. But in what is thought thinking is in the mode of thought (νοητῶς), in thinking what is thought is in the mode of thinking (νοερῶς). Substance is the enduring element in existence and that which is interwoven with the first principles and which does not proceed from the one." The second, "the life, is however that which proceeds from the principles and is born with infinite capacity;" it is itself the whole totality in the determination of infinitude, so that it is a concrete manifold. "The understanding is, again, the limit which leads back once more to the principles, brings about conformity with the principle, and accomplishes an intellectual circle. Now since it is a three-fold in itself, in part it is the substantial in itself, in part the living, in part the intellectual, but everything is substantially contained in it, and hence it is the foremost in existence, that which is united from the first principles." That is the first reality. Excellent! "I call it substance, since the first substance (αὐτοουσία) is supreme over all existence and is, so to speak, the monad of everything. The understanding itself is that which knows, but life is thinking, and Being is just what is thought. Now if the whole of what exists is mingled, but the first existence (τὸ αὐτοόν) is substance, the substance that comes from the three principles (ὑφισταμένε) is mingled. What is mingled is thus substance as thought; it is from God, from whom also come the infinite and limitation. There are thus four moments, since what is mingled is the fourth." The first is the monad, the absolute one, then come the many which themselves are units, the infinite of Plato; the third is limitation. The one is clearly all-penetrating, remaining at home with itself, all-embracing; it does not thus appear as one of the three moments, for Proclus adds a fourth which then likewise appears as the third moment, since it is the totality. "This united one is not only derived from those principles which are according to the one, but it also goes forth from them and is three-fold." It is one trinity and three trinities. The limit and the

infinite are, according to Proclus (Theol. Plat. III. pp. 138, 139), before substance and again in it; and this unity of moments is what comes first in all existence (πρωτίστη οὐσία). In the abstract trinity everything is thus contained in itself. Proclus says (Theol. Plat. III. pp. 139, 140): "The truly existent has the trinity of Beauty, Truth, and Symmetry in itself" (this is the way in which, like Plato, he names these three triads), "Beauty for order, Truth for purity, and Symmetry for the unity of what is joined together. Symmetry gives the cause that the existent is unity; Truth, that it is Being; Beauty, that it is thought." Proclus shows that in each of the three triads, limit, the unlimited, and that which is mingled, are contained; each order is thus the same, but set forth in one of the three forms which constitute the first triad.

a. Proclus says (Theol. Plat. III. p. 140): "Now this is the first triad of all that is thought — the limit, the infinite, and that which is mingled. The limit is God going forth to the culminating point of thought from the uncommunicable and first God, measuring and determining everything, admitting all that is paternal and coherent, and the unblemished race of gods. But the infinite" (quantity) "is the inexhaustible potentiality of this God, that which makes all productions and orders to appear, and the whole infinitude, the primeval essence as well as the substantial, and even the ultimate matter. What is mingled is, however, the first and highest order (διάκοσμος) of the gods, and it is that which holds everything concealed in itself, completed in accordance with the intelligible and all-embracing triad, comprehending in simple form the cause of all that exists, and establishing in the first objects of thought the culminating point which is derived from the wholes." The first order is thus in its culminating point the abstract substance in which the three determinations as such are shut up without development and maintained in strict isolation; this pure reality is in so far the undisclosed. It is the greatest height reached by thought and likewise

really the turning back, as this likewise appears in Plotinus; and this first begets in its culminating point the second order which in the whole is life, and culminates in its turn in the νοῦς.

b. This second triad is placed in the determination of the infinite. On making this step forward Proclus (Theol. Plat. III. pp. 141, 142) breaks into a transport of bacchanalian ecstasy, and says, "After this first triad which remains in unity, let us now in hymns praise the second which proceeds from this, and is brought to pass through the abolition of that which comes before it. As the first unity begets the culminating point of existence, the middle unity begets the middle existence; for it is likewise begetting and self-retaining." In the second order three moments again appear as before: "Here the principle or the first is the substance which was the completion of the first triad; the second, which was there the infinite, is here potentiality (δύναμις). The unity of both these is Life (ζωή)," the centre, or what gives determinateness to the whole order; "the second existence is life as thought, for in the most external thought Ideas have their subsistence (ὑπόστασιν). The second order is a triad analogous to the first, for the second is likewise a God." The relationship of these trinities is hence this: "As the first triad is everything, but is so intellectually (νοητῶς) and as proceeding immediately from the one (ἑνκαίως), and remaining within limits (περατοειδῶς), so the second is likewise everything, but in living fashion and in the principle of infinitude (ζωτικῶς καὶ ἀπειροειδῶς), and similarly the third has proceeded after the manner of what is mingled. Limitation determines the first trinity, the unlimited the second, the concrete (μικτόν) the third. Each determination of unity, the one placed beside the other, also explains the intelligible order of gods; each contains all three moments subordinate to itself, and each is this trinity set forth under one of these moments." These three orders are the highest gods; later on, we find in Proclus (in Timæum, pp. 291, 299) four orders of gods appearing.

c. Proclus comes (Theol. Plat. III. p. 143) to the third triad, which is thought itself as such, the νούς: "The third monad places round itself the νούς as thought, and fills it with divine unity; it places the middle between itself and absolute existence, fills this last by means of the middle and turns it to itself. This third triad does not resemble cause (κατ᾽ αἰτίαν), like the first existence, nor does it reveal the all like the second; but it is all as act and expression (ἐκφανῶς); hence it is also the limit of all that is thought. The first triad remains concealed in limit itself, and has all subsistence of intellectuality fixed in it. The second is likewise enduring, and at the same time steps forward;" the living appears, but is in so doing led back to unity. "The third after progression shifts and turns the intelligible limit back to the beginning, and bends the order back into itself; for the understanding is the turning back to what is thought" (to unity), "and the giving of conformity with it. And all this is one thought, one Idea: persistence, progression and return." Each is a totality on its own account, but all three are led back into one. In the νοῦς the first two triads are themselves only moments; for spirit is just the grasping in itself of the totality of the first two spheres. "Now these three trinities announce in mystic form the entirely unknown (ἄγνωστον) cause of the first and unimparted (ἀμεθεκτοῦ) God," who is the principle of the first unity, but is manifested in the three: "the one has inexpressible unity, the second the superfluity of all powers, but the third the perfect birth of all existence." In this the mystic element is that these differences which are determined as totalities, as gods, become comprehended as one. The expression "mystic" often appears with the Neo-Platonists. Thus Proclus for example says (Theol. Plat. III. p. 131): "Let us once more obtain initiation into the mysteries (μυσταγωγίαν) of the one." Mysticism is just this speculative consideration of Philosophy, this Being in thought, this self-satisfaction and this sensuous perception. However, μυστήριον has not to the Alexandrians the meaning that it has to us, for to

them it indicates speculative philosophy generally. The mysteries in Christianity have likewise been to the understanding an incomprehensible secret, but because they are speculative, reason comprehends them, and they are not really secret, for they have been revealed.

In conclusion, Proclus institutes a comparison between these triads. "In the first order the concrete is itself substance, in the second it is life, and in the third the thought that is known." Proclus calls substance likewise Ἑστία, the fixed, the principle. "The first trinity is the God of thought (θεὸς νοητός); the second the thought of and thinking (θεὸς νοητὸς καὶ νοερός)" the active; "the third the" pure, "thinking God (θεὸς νοερός)," who is in himself this return to unity in which, as return, all three are contained; for "God is the whole in them." These three are thus clearly the absolute one, and this then constitutes one absolute concrete God. "God knows the divided as undivided, what pertains to time as timeless, what is not necessary as necessary, the changeable as unchangeable, and, speaking generally, all things more excellently than in accordance with their order. Whose are the thoughts, his also are the substances, because the thought of every man is identical with the existence of every man, and each is both the thought and the existence," and so on.[255]

These are the principal points in the theology of Proclus, and it only remains to us to give some external facts. The individuality of consciousness is partially in the form of an actuality, as magic and theurgy; this often appears among the Neo-Platonists and with Proclus, and is called making a god. The element of theurgy is thus brought into relation with the heathen divinities: "The first and chief names of the gods, one must admit, are founded in the gods themselves. Divine thought makes names of its thoughts, and finally shows the images of the gods; each name gives rise, so to speak, to an image of a god. Now as theurgy through certain symbols calls forth the unenvying goodness of God to the light of the images of the

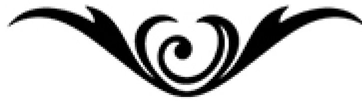
artist, the science of thought makes the hidden reality of God appear through the uniting and separating of the tones."[256] Thus the statues and pictures of artists show the inward speculative thought, the being replete with the divinity that brings itself into externality; thus the consecration of images is likewise represented. This connecting fact — that the Neo-Platonists have even inspired the mythical element with the divine — is thereby expressed, so that in images, &c., the divine power is present. Nevertheless I have only wished to call this moment to mind because it plays a great part at this particular time.

5. The Successors of Proclus.

In Proclus we have the culminating point of the Neo-Platonic philosophy; this method in philosophy is carried into later times, continuing even through the whole of the Middle Ages. Proclus had several successors who were scholarchs at Athens — Marinus, his biographer, and then Isidorus of Gaza, and finally Damascius. Of the latter we still possess some very interesting writings; he was the last teacher of the Neo-Platonic philosophy in the Academy. For in 529 A.D. the Emperor Justinian caused this school to be closed, and drove all heathen philosophers from his kingdom: amongst these was Simplicius, a celebrated commentator on Aristotle, several of whose commentaries are not yet printed. They sought and found protection and freedom in Persia under Chosroïs. After some time they ventured to return to the Roman Empire, but they could no longer form any school at Athens; thus as far as its external existence is concerned, the heathen philosophy went utterly to ruin.[257] Eunapius treats of this last period, and Cousin has dealt with it in a short treatise. Although the Neo-Platonic school ceased to exist outwardly, ideas of the Neo-Platonists, and specially the philosophy of Proclus, were long maintained and preserved in the Church; and later on we shall on several occasions refer to it. In the earlier,

purer, mystical scholastics we find the same ideas as are seen in Proclus, and until comparatively recent times, when in the Catholic Church God is spoken of in a profound and mystical way, the ideas expressed are Neo-Platonic.

In the examples given by us perhaps the best of the Neo-Platonic philosophy is found; in it the world of thought has, so to speak, consolidated itself, not as though the Neo-Platonists had possessed this world of thought alongside of a sensuous world, for the sensuous world has disappeared and the whole been raised into spirit, and this whole has been called God and His life in it. Here we witness a great revolution, and with this the first period, that of Greek philosophy, closes. The Greek principle is freedom as beauty, reconciliation in imagination, natural free reconciliation that is immediately realized, and thus represents an Idea in sensuous guise. Through philosophy thought, however, desires to tear itself away from what is sensuous, for philosophy is the constitution of thought into a totality beyond the sensuous and the imaginary. Herein is this simple progression contained, and the points of view which we have noticed are, as cursorily surveyed, the following.



First of all we saw the abstract in natural form: then abstract thought in its immediacy, and thus the one, Being. These are pure thoughts, but thought is not yet comprehended as thought; for us these thoughts are merely universal thoughts to which the consciousness of thought is still lacking. Socrates is the second stage, in which thought appears as self, the absolute is the thought of itself; the content is not only determined, *e.g.* Being, the atom, but is concrete thought, determined in itself and subjective. The self is the most simple form of the concrete, but it is still devoid of content; in as far as it is determined it is concrete, like the Platonic Idea. This content, however, is only implicitly concrete and is not yet known as such; Plato, beginning with what is given, takes the more determinate

content out of sensuous perception. Aristotle attains to the highest idea; the thought about thought takes the highest place of all; but the content of the world is still outside of it. Now in as far as this manifold concrete is led back to the self as to the ultimate simple unity of the concrete, or, on the other hand, the abstract principle has content given to it, we saw the systems of dogmatism arising. That thought of thought is in Stoicism the principle of the whole world, and it has made the attempt to comprehend the world as thought. Scepticism, on the other hand, denies all content, for it is self-consciousness, thought, in its pure solitude with itself, and likewise reflection on that beginning of pre-suppositions. In the third place the absolute is known as concrete, and this is as far as Greek philosophy goes. That is to say, while in the system of Stoics the relation of difference to unity is present only as an "ought," as an inward demand, without the identity coming to pass, in the Neo-Platonist school the absolute is finally set forth in its entirely concrete determination, the Idea consequently as a trinity, as a trinity of trinities, so that these ever continue to emanate more and more. But each sphere is a trinity in itself, so that each of the abstract moments of this triad is itself likewise grasped as a totality. Only that which manifests itself, and therein retains itself as the one, is held to be true. The Alexandrians thus represent the concrete totality in itself, and they have recognized the nature of spirit; they have, however, neither gone forth from the depths of infinite subjectivity and its absolute chasm, nor have they grasped the absolute, or, if we will, abstract freedom of the "I" as the infinite value of the subject.

The Neo-Platonic standpoint is thus not a philosophic freak, but a forward advance on the part of the human mind, the world and the world-spirit. The revelation of God has not come to it as from an alien source. What we here consider so dry and abstract is concrete. "Such rubbish," it is said, "as we consider when in our study we see philosophers dispute and

argue, and settle things this way and that at will, are verbal abstractions only." No, no; they are the deeds of the world-spirit, gentlemen, and therefore of fate. The philosophers are in so doing nearer to God than those nurtured upon spiritual crumbs; they read or write the orders as they receive them in the original; they are obliged to continue writing on. Philosophers are the initiated ones — those who have taken part in the advance which has been made into the inmost sanctuary; others have their particular interests — this dominion, these riches, this girl. Hundreds and thousands of years are required by the world-spirit to reach the point which we attain more quickly, because we have the advantage of having objects which are past and of dealing with abstraction.

[89] Not only the form which is to be abrogated, but also matter is spoken of by Aristotle as τι, because in truth the form which is to be abrogated serves only as material for the form which is to be posited; so that he in the first passage names the three moments ἔκ τινος, τι, ὑπό τινος, and in the last passage names them τι, εἴς τι, ὑπό τινος. — [Editor's Note.]

[90] As this explanation by Hegel of Aristotle's celebrated passage has so many authorities to support it, the editor cannot here, as frequently elsewhere in these lectures, remain faithful to the directions of his colleagues, quietly to set right anything that is incorrect. It is, nevertheless, clear that Aristotle is speaking of three substances: a sublunar world, which the heavens move; the heavens as the centre which is both mover and moved; and God, the unmoved Mover. The passage must therefore, on the authority of Alexander of Aphrodisias (Schol. in Arist. ed. Brandis, p. 804 *b*), of Cardinal Bessarion (Aristoteles lat. ed. Bekk. p. 525 *b*) and others, be thus read: ἔστι τοίνυν τι καὶ ὃ κινεῖ (sc. ὁ οὐρανός)· ἐπεὶ δε τὸ κινούμενον καὶ κινοῦν καὶ μέσον τοίνυν, ἔυτι τι ὃ οὐ κινούμενον κινεῖ. The translation, if this reading be adopted, would be as follows: Besides the heavens in perpetual motion "there is something which the heavens move. But since that which at the same time is moved and causes movement cannot be other than a centre, there is also a mover that is unmoved." (Cf. Michelet: Examen critique, etc., p. 192; Jahrbücher für wisseuschaftliche Kritik, November, 1841, No. 84, pp. 668, 669). [Editor's note]

[91] συστοιχία is a good word, and might also mean an element which is itself its own element, and determines itself only through itself.

[92] The word τὸ εἶναι, when it governs the dative (τὸ εἶναι νοήσεί καὶ νοουμένῳ) invariably expresses the Notion, while, when it governs the accusative, it denotes concrete existence. (Trendelenburg: Comment, in Arist. De anima, III. 4, p. 473.) [Editor's Note.]

[93] Aristotle here distinguishes four determinations: what is moved in capacity, or the movable [das Bewegbare] (κινητόν); what is moved in actuality (κινούμενον); the moving in capacity (κινητικόν), or what Hegel calls the motive [das Bewegliche]; the moving in actuality (κινοῦν). It might have been better to translate κινητόν by motive [Beweglich] and κινητικόν by mobile [Bewegerisch]. — [Editor's note.]

[94] While above (p. 164) we must take the expression τὸ εἶναι as immediate existence because it is opposed to the Notion, here it has the meaning of Notion, because it stands in opposition to immediate existence (καὶ οὐ χωριστὴ μὲν ὕλη, δ' εἶναι, καὶ μία τῷ ἀριθμῷ). Cf. Michelet: Comment. in Arist. Eth. Nicom. V. I., pp. 209-214. — [Editor's note.]

[95] Here τὸ εἶναι has again the signification of Notion, as above (p. 169), because in the preceding words (ἔστι δὲ ταὐτὸ καὶ κατὰ ταὐτὸ ἡ διαίρεσις καὶ ἥ ἕνωσις) immediate existence is expressed. — [Editor's note.]

[96] The editor has considered himself justified in adopting this rendering, which was commonly used by the Scholastics, and revived by Leibnitz. (Cf. Michelet, Examen Critique, &c., pp. 165, 261, 265.)

[97] Here and once again on this page τὸ εἶναι is the immediate existence of the separate sides of sense-perception, therefore their mere potentiality; while, on the other hand, the active unity of the perceived and the percipient may be expressed as the true Notion of sense-perception. — [Editor's Note.]

[98] *Cf. supra*, p. 169, and note there given. The two significations of τῷ εἶναι here come into immediate contact with one another, being likewise intermingled; for immediate existence (ἀριθμῷ ἀδιαίρετον καὶ ἀχωριστον), which is opposed to the Notion (τῷ εἶναι) becomes in what directly follows mere possibility, to which the true reality (δυνάμει μὲν γὰρ τὸ αὐτὸ καὶ ἀδιαίρετον εἶναι) is opposed (δυνάμει μὲν γὰρ τὸ αὐτὸ καὶ ἀδιαίρετον τἀναντία, δ' εἶναι ου, ἀλλα τῷ ἐνεργεῖσθαι διαίρετον). — [Editor's Note.]

[99] Cf. Tenneman, Vol. III. p. 198.

[100] While Aristotle's reply is short, and given in the manner usually adopted by him, that of following up by a second question the first question proposed (ἢ οὐδὲ τἆλλα φαντάσματα, ἀλλ´ οὐκ ἄνευ φαντασμάτον;), this answer seems quite sufficient. For Aristotle's words certainly bear the meaning that the original thoughts of the active understanding (the reason), in contradistinction to those of the passive understanding, have quite obliterated in themselves the element of pictorial

conception; while in the latter this has not been thoroughly carried out, though even in them pictorial conception is not the essential moment. — [Editor's Note.]

[101] Against this we have only to remember that in Aristotle's way of speaking ὕστερον and πρότερον always refer to the work they occur in, while he marks quotations from his other writings by the words: ἐν ἄλλοις, ἐν ἑτέροις, ἄλλοτε, or εἰς ἐκεῖνον τὸν καιρὸν ἀποκείσθω (De Ausc. phys. I. 9). And if it be said, as it may be with truth, that all the physical and psychological works, including the Metaphysics, form one great scientific system, so that ὕστερον and πρότερον may very well be used in relating these works to one another, I have yet proved that the treatise περὶ ψυχῆς must be placed much later than the Metaphysics (Michelet: Examen Critique, &c., pp. 209-222). Might not then the expression ὕστερον refer to the following chapter? In truth, the difficulty raised at the end of the seventh chapter seems completely solved by the words of the eighth chapter quoted above (pp. 198, 199). — [Editor's Note.]

[185] As it is used here and shortly afterwards, “positive philosophy” has quite an opposite meaning from what we have just seen it to bear in two previous passages (p. 329), because speculation certainly stands in opposition to dogmatism; and at the same time we must in Hegel distinguish

altogether this expression in its double significance from the positivism so prevalent in modern times, which, merely escaping from the necessity for thinking knowledge, finally throws itself into the arms of revelation and simple faith, whether it tries to call itself free thought or not. — [Editor's note.]

PART TWO. PHILOSOPHY OF THE MIDDLE AGES

INTRODUCTION

THE FIRST PERIOD embraces a space of one thousand years — from Thales, 550 B.C., to Proclus, who died 485 A.D., and until the disappearance of pagan philosophy as an outward institution, 529 A.D. The second period extends to the sixteenth century, and thus again embraces a thousand years, to pass over which we must provide ourselves with seven-leagued boots. While Philosophy has hitherto found its place in the religion of the heathen, from this time on it has its sphere within the Christian world; for Arabians and Jews have only to be noticed in an external and historic way.

1. Through the Neo-Platonic philosophy we have come into quite familiar acquaintance with the Idea of Christianity, as the new religion which has entered into the world. For the Neo-Platonic philosophy has as its essential principle the fact that the Absolute is determined as spirit in a concrete way, that God is not a mere conception. Although the Absolute is Thought, it must, in order to be true, be concrete in itself and not abstract; in what we have just seen we have, then, the first appearance of the absolutely existent spirit. But in spite of their profound and true speculation, the Neo-Platonists still had not proved their doctrine that the Trinity is the truth, for there is lacking to it the form of inward necessity. The Neo-Platonists begin from the One that determines itself, that sets a limit to itself from which the determinate proceeds; this, however, is itself an immediate method of presentation, and it is this that makes such philosophers as Plotinus and Proclus so tiresome. Undoubtedly dialectic considerations enter in, in which the opposites which are conceived as absolute are shown to be null; but this dialectic is not methodical, but occurs only disconnectedly. The principle of

retroversion and comprehension found with the Neo-Platonists is that of substantiality generally, but because subjectivity is lacking, this idea of Spirit is deficient in one moment, the moment of actuality, of the point which draws all moments into one, and which thereby becomes immediate unity, universality, and Being. To them spirit is thus not individual spirit; and this deficiency is made good through Christianity, in which spirit is found as actual, present spirit, immediately existent in the world here and now, and the absolute spirit is known in the immediate present as man.

In order to grasp and apply the Idea of Christianity, the philosophic Idea of which we have already spoken in connection with the Neo-Platonists must have been comprehended for itself; but within Christianity the basis of Philosophy is that in man has sprung up the consciousness of the truth, or of spirit in and for itself, and then that man requires to participate in this truth. Man must be qualified to have this truth present to him; he must further be convinced of this possibility. This is the absolute demand and necessity; the consciousness must be arrived at that this alone is true. The first point of interest in the Christian religion thus is that the content of the Idea should be revealed to man; more particularly that the unity of the divine and human nature should come to the consciousness of man, and that, indeed, on the one hand as an implicitly existent unity, and, on the other, in actuality as worship. The Christian life signifies that the culminating point of subjectivity is made familiar with this conception, the individual himself is laid claim to, is made worthy of attaining on his own account to this unity, which is to make himself worthy of the Spirit of God — Grace, as it is called — dwelling in him. Hence the doctrine of reconciliation is that God is known as reconciling Himself with the world, *i.e.* as we have seen in the Neo-Platonic philosophy, that He particularizes Himself and does not remain abstract. Not external nature alone, but the whole world pertains to the particular; above all must human individuality know itself in God. The

interest of the subject is itself involved, and here it plays an essential rôle in order that God may be realized and may realize Himself in the consciousness of individuals who are spirit and implicitly free. Thus through the process these accomplish that reconciliation in themselves, actualize their freedom; that is to say, they attain to the consciousness of heaven upon earth, the elevation of man to God. Thus the true intellectual world is not a beyond, but the so-called finite is an element in it, and no division exists between this side and that. The real concrete in regard to the absolute Idea is the knowing of the mundane, the 'other' in God, as implicitly divine, as universal, as the world of intellect, as having its root in God, but only the root. In God man is accepted only in his truth, and not in his immediacy, and thus this doctrine is not what we call Pantheism, for that leaves the immediate just as it is. Man then has himself to accomplish the process of reconciliation in himself in order to attain to his truth. We have thus seen that man possesses the determination and attributes of God as the first begotten son, Adam Kadmon, the first man; we may call this unity the concrete Idea, which, however, is still only implicit.

But the fact that because man is capable of the divine, the identity of the divine and human nature must likewise be present for him, has in an immediate way become known to him in Christ, as one in whom the divine and human nature are implicitly one. In the world what has come to pass is that the Absolute has been revealed as the concrete, and, further, not only in thought in a general way as intelligible world, but because it has in itself proceeded to its ultimate point of intensity. Thus it is an actual self, an "I," the absolute universal, the concrete universal, that is God; and also the absolute opposite of this determination, the clearly finite as it exists in space and time, but this finite determined in unity with the eternal as self. The Absolute comprehended as concrete, the unity of these two absolutely

different determinations, is the true God; each of them is abstract, and either of them taken by itself is thus not the true God. The fact that the concrete is thus known to men in this perfection as God, brings about the whole revolution that has taken place in the world's history. The Trinity is thereby not only present in conception, which would not yet constitute the perfect concrete, but actuality is perfectly united to it. In the consciousness of the world it has consequently broken in upon men that the Absolute has attained to this "culminating point" of immediate actuality, as Proclus says; and that is the manifestation of Christianity. The Greeks were anthropomorphic, their gods were humanly constituted; but the deficiency in them is that they were not anthropomorphic enough. Or rather the Greek religion is on the one hand too much, and, on the other hand, too little anthropomorphic — too much, because immediate qualities, forms, actions, are taken up into the divine; too little, because man is not divine as man, but only as a far-away form and not as 'this,' and subjective man.

Thus man reaches this truth, because for him it becomes a sure intuition that in Christ the λόγος has become Flesh. We thus first have man through this process attaining to spirituality, and in the second place we have man as Christ, in whom this original identity of both natures is known. Now since man really is this process of being the negation of the immediate, and from this negation attaining to himself — to a unity with God — he must consequently renounce his natural will, knowledge, and existence. This giving up of his natural existence is witnessed in Christ's sufferings and death, and in His resurrection and elevation to the right hand of the Father. Christ became a perfect man, endured the lot of all men, death; as man He suffered, sacrificed Himself, gave up His natural existence, and thereby elevated Himself above it. In Him this process, this conversion of His other-being into spirit, and the necessity of pain in the renunciation of the natural man is witnessed; but this pain, the pain of feeling that God Himself is

dead, is the starting point of holiness and of elevation to God. Thus what must come to pass in the subject — this process, this conversion of the finite — is known as implicitly accomplished in Christ. This constitutes the great leading Idea of Christianity.

From what has been said it follows, in the second place, that the world must not be left in its immediate naturalness. The original, implicitly existent, is found only in the strictest conception of mind, or as its determination: immediately, man is only a living being, who has indeed the capacity to become actual spirit — but spirit does not pertain to nature. Man is thus not by nature this particular in which the spirit of God lives and dwells: man is not by nature what he ought to be. The animal is by nature what it ought to be. But what has to be noticed in this respect is that natural things merely remain in their implicit Notion, or their truth does not enter into their sensuous life, for this their natural individuality is only a fleeting fact that cannot look back on itself. The misfortune in natural things is that they get no further, that their essential nature is not for itself and independent; from this it follows that they do not attain to infinitude, to liberation from their immediate individuality, *i.e.* they do not attain to freedom, but only remain in the necessity which is the connection of the "one" with an "other," so that when this other unites itself to natural things, these last perish because they cannot bear the contradiction. But because the truth exists for man as consciousness, and in it he has the qualities necessary for freedom, he is capable of perceiving the Absolute, of placing himself in a relation to the same, and having knowledge as an end; and the liberation of mind depends on the fact that consciousness does not remain in its natural condition, but becomes spiritual, *i.e.* that for it the eternal, that is the reconciliation of the finite as this subject with the infinite, exists. Thus consciousness does not signify remaining in the sphere of nature, but the existence of the process whereby the universal becomes object or end to

man. Man makes himself divine, but in a spiritual, that is to say not in an immediate way. In the ancient religions the divine is also united to the natural or human; but this unity is no reconciliation, but an immediate, undeveloped, and thus unspiritual unity, just because it is merely natural. But because mind is not natural but only that into which it makes itself, the spiritual is first met with in this very process of producing unity. To this spiritual unity pertains the negation of nature, of the flesh, as that in which man must not rest; for nature is from the beginning evil. Man is likewise naturally evil, for all the wickedness that man does proceeds from a natural desire. Now because man is in himself the image of God, but in existence is only natural, that which is implicit must be evolved, while the first natural condition must be abrogated. So much the more is it true that man first becomes spiritual, and attains to truth through rising above the natural, inasmuch as God Himself is a spirit only in that He transformed the hidden unity into the other of Himself, in order from this other to turn back again into Himself.

Now the fact that this is given as, or asserted to be the fundamental Idea of Christianity, implies on the one hand an historic question; at different times this idea has been grasped in different ways, and now, for example, men again have their particular conceptions of it. In order to bring about the conclusion that this is the historic idea of Christianity, we should have to enter upon an historic disquisition; but because we cannot deal with this here, we must accept it as an historic axiom. On the other hand, in so far as this question falls within the history of Philosophy, the assertion that this is the idea of Christianity has another ground to stand on than that of history, and this constitutes the third point of interest. In connection with the preceding forms it has been shown that this Idea of Christianity must have now come forth, and indeed become the universal consciousness of the

nations. The fact that it has come forth as the world-religion, is the content of history; it is this necessity in the Idea which has to be expounded more clearly in the philosophy of history. To this end the conception of mind must be made fundamental, and it must now be shown that history is the process of mind itself, the revelation of itself from its first superficial, enshrouded consciousness, and the attainment of this standpoint of its free self-consciousness, in order that the absolute command of mind, "Know thyself," may be fulfilled. The recognition of this necessity has been called the *à priori* construction of history; there is no good in decrying it as inadmissible, and indeed as arrogant. The development of history may be represented as contingent. Or, if the providence and government of God are seriously accepted, these are represented as though Christianity were so to speak ready made in the mind of God; then, when thrust into the world, it appears to be contingent. But the rationality and likewise the necessity of this decree of God's has now to be considered, and this may be called a theodicy, a justification of God, *i.e.* a vindication of our Idea. It is a demonstration that, as I have just said, things have happened rationally in the world, and it implies the fact that the world-history represents the process of mind partially as the history of mind, which has to be reflected into itself in order to come to a consciousness of what it is. It is this which is shown forth in temporal history, and as history, indeed, just because mind is the living movement, proceeding from its immediate existence to beget revolutions in the world, as well as in individuals.

Since it is hereby presupposed that this Idea must necessarily become universal religion, there is, in the fourth place, present in it the source of a method of knowledge proper to the particular consciousness. That is to say, the new religion has made the intelligible world of Philosophy the world of common consciousness. Tertullian hence says: "Even children in our day have a knowledge of God, which the wisest men of antiquity alone attained

to.” But in order that all may know the truth, this Idea must come to them as an object, not for the thinking, philosophic and cultured consciousness, but for the sensuous consciousness which still adheres to uncultured methods of regarding things. If this Idea were not to receive and to retain this form of outward consciousness, it would be a philosophy of the Christian religion; for the standpoint of Philosophy is the Idea in the form of the merely universal thought, and not the Idea as it is for the subject and directed to the subject. That through which this Idea appears as religion, belongs, however, to the history of religion, and this development of its form must here be passed over. Through these forms we must however not mistake the content, much less reject it altogether, for we must rather recognize its presence more completely; the forms must likewise not be held to be absolute, and we must not try to maintain the doctrines in this form alone, as was at one time done by an orthodoxy “of straw.”

Only one example will here be given. The so-called doctrine of original sin implies that our first parents have sinned, that this sin has thus descended to all mankind as an hereditary disorder, and has come upon posterity in an external way as something inherent in their nature, which does not pertain to freedom of the mind, nor has its ground therein. Through this original sin, it is further signified, man has drawn upon himself the wrath of God. Now if these forms be adhered to, we have in the first place there the first parents in time, and not in thought; but the thought of these first parents is none other than man as he is in and for himself. What is said of him as such, what every member of the human race really is in himself, is represented here in the form of the first man, Adam; and in this first man sin manifests itself as something contingent, or, more particularly, in his allowing himself to be enticed into eating of the apple. But it is again not merely represented that he simply partook of the fruit, but that he ate of the tree of the knowledge of good and evil; it is as man that he must partake of

it, and not as beast. The fundamental characteristic, however, through which he distinguishes himself from the animal, is the very fact that he knows what good and evil are. For God likewise says, "Behold, Adam has become as one of us, to know good and evil." But it is only through man's having the power of thinking that he can make this distinction between good and evil; in thought alone is there thus the source of good and evil, but the healing of the evil which is brought about through thought is also there. The second point is that man is by nature evil and transmits the evil. On the other hand, it is said: "Why should the sinner suffer punishment seeing that there is no responsibility for what is inborn in him?" As a matter of fact the statement that man is implicitly or by nature evil would seem to be a hard saying. But if we set aside this hard saying, and do not speak of a divine punishment, but make use of milder general expressions, in this idea of original sin the fact remains for us that man as he is by nature is not what he ought to be before God, but has the power of becoming explicitly what he only is implicitly; and the fact that this rests in the determination of man as such is represented as inheritance. The abrogation of mere naturalness is known to us simply as education, and arises of itself; through education subjection is brought about, and with that a capacity for becoming good is developed. Now if this appears to come to pass very easily, we must recollect that it is of infinite importance that the reconciliation of the world with itself, the making good, is brought about through the simple method of education.

2. What concerns us now is to make the Principle of Christianity, which has been explained at considerable length, into the principle of the world; the task set before the world is to bring this absolute Idea within itself, to actualize it in itself, and thereby to reconcile itself to God. This task once more falls into three separate divisions.

In the first place we have the dissemination of the Christian religion and the bringing of it within the hearts of men; this, however, lies outside the limits of our consideration. The heart signifies the subjective man as ‘this,’ and through this principle the latter has a different position from before; it is essential that this subject should be present. The individual subject is the object of divine grace; each subject, or man as man, has on his own account an infinite value, is destined to partake of this spirit which must, as God, be born within the heart of every man. Man is determined for freedom, he is here recognized as implicitly free; this freedom is, however, at first only formal, because it remains within the principle of subjectivity.

The second point is that the principle of the Christian religion should be worked out for thought, and be taken up into thinking knowledge, and realized in this; and thus that it should attain to reconciliation, having the divine Idea within itself, and that the riches of thought and culture belonging to the philosophic Idea should become united to the Christian principle. For the philosophic Idea is the Idea of God, and thought has the absolute right of reconciliation, or the right to claim that the Christian principle should correspond with thought. The Fathers have rendered the service of thus elaborating the Christian religion in thinking knowledge; but neither have we to consider further this development of the Christian principle, since it belongs to the history of the Church. We have only here to give the point of view adopted regarding the relation of the Fathers to Philosophy. They for the most part lived within the ancient Roman world and in Latin culture, though the Byzantines likewise are included with them. We know that the Fathers were men of great philosophic culture, and that they introduced Philosophy, and more especially Neo-Platonic philosophy, into the Church; in this way they worked out a Christian system by which the first mode in which Christianity was manifested in the world was supplemented, for system was not present in this first manifestation.

The Fathers have dealt with all questions respecting the nature of God, the freedom of man, the relationship to God — who is the objective — the origin of evil, and so on; and whatever thought decided regarding these questions was by them brought into and incorporated with the Christian system. The nature of spirit, the way of salvation, *i.e.* the various stages in the spiritualizing of the subject, his growth, the process of spirit, whereby it is spirit, the changes it has undergone, they have likewise treated in its freedom, and recognized its moments in the depths to which it reaches.

We may thus describe the attitude of the Christian Fathers, and likewise remark that this first philosophic development of the Christian principle has been looked on as a crime on their part, and it has been said that they have thus corrupted the purity of Christianity as originally manifested. We must speak of the nature of this corruption. It is well known that Luther in his Reformation made his aim the bringing of the Church back to the purity of its first estate in the early centuries, but this first condition already shows the fabric of an extensive and closely interwoven system, an elaborate tissue of doctrines regarding what God is and what is man’s relation to Him. Hence at the time of the Reformation no particular system was built up, but what was originally there was purified from later additions; it is a complicated erection, in which the most intricate pieces of workmanship are to be found. In modern times this elaborately woven system has been entirely pulled to pieces, because men have wished to bring Christianity back to the simple lines of the Word of God as found in the writings of the New Testament. Men have likewise given up the propagation of the system, the doctrine of Christianity as determined through the Idea and by the Idea, and have returned to the manner of its first appearance (and that, indeed, in eclectic fashion, and having regard to what will fit in with their own notions), so that now only the original Gospel narrative is regarded as forming the basis of Christianity. As regards the title of Philosophy and the

Fathers to bring Philosophy into Christianity we have the following remarks to make.

Modern Theology on the one hand derives its formulas from the words of the Bible, which are made to form their basis, so that the whole business of the individual, as regards his thoughts and his conceptions, is merely exegetical; religion must be retained in its positive form, and thus it is from something received and given, something most evidently externally posited and revealed, that a beginning must be made. These words and this text are, however, of a nature such that they allow full latitude to the will of the interpreter; hence the other side is also present, or the application of the Bible saying: "The letter killeth, but the spirit giveth life." This must be assented to, and the spirit means none else than the power which dwells within those who apply themselves to the letter in order that they may spiritually apprehend and animate it. This signifies that it is the conceptions which we bring along with us which have in the letter to give efficacy to themselves. Now these reflections brought along with us may be grasped by the most ordinary human understanding, which is what is indicated in modern times when we say that dogmas must be popular. In that way the right to act upon the letter with the spirit is assumed, *i.e.* the right to approach it with our individual judgment; but to the Fathers this is forbidden. They did act upon it with the Spirit; and it is expressly said that the Spirit dwells within the Church, directs, teaches, and illuminates it. The Fathers have hence a similar right to relate themselves with the Spirit to the positive, to what is given by the senses. Only it will depend absolutely upon what the nature of the Spirit is, for spirits are very different.

The assertion that the spirit must give life to the mere letter is certainly more definitely stated as that spirit has only to expound what is given, *i.e.* it must leave the actual sense of what is immediately contained in the words. We must, however, be far behind in culture if we do not see the fallacy in

the attitude here adopted. To expound without the individual spirit, as though the sense were one entirely given, is impossible. To elucidate signifies to make clear, and it must be made clear to me; this can be done by nothing excepting what was already present in me. It must be in conformity with my subjective judgment, the necessities of my knowledge, of my apprehension, of my heart, &c.; thus only is it for me. We find what we look for, and just because I make it clear to myself, I make my conception, my thought, a factor in it; otherwise it is a dead and external thing, which is not present for me at all. It is hence very difficult to make clear to ourselves those foreign religions which lie far below our spiritual needs; but yet they touch a side of my spiritual necessities and standpoints, although it is but a dim and sensuous side. Thus when we talk of "making clear," we conceal the real matter in a word; but if this word itself is made clear we find nothing in it but the fact that the spirit which is in man desires therein to recognize itself, and that it cannot know anything which does not rest in him. Thus have men made of the Bible what may be called a nose of wax. This man finds this thing, the other man that; what was secure now shows itself as insecure, because it is considered by the subjective spirit.

In this regard the nature of the text describing the method in which the first manifestation of Christianity took place, must be remarked upon; it cannot as yet expressly contain that which rests in the principle of Christianity, but only somewhat of an anticipation of what spirit is and will know as true. This also is expressly said in the text itself. Christ says: "If I depart, I will send the Comforter, the Holy Ghost.... He will guide you into all truth," He — and not Christ's earthly presence nor His spoken words. It was only to be after Him, and after His teaching through the text, that the Spirit was to come into the Apostles, and that they were to become full of the Spirit. It might almost be said that when Christianity is carried back to its first appearing, it is brought down to the level of unspirituality, for Christ

Himself says that the Spirit will not come until He Himself has departed. In the text of the first manifestation of Christianity we, on the other hand, see Christ only as the Messiah, or under the more explicit designation of a mere teacher; for His friends and apostles He is a present man whom they can perceive by the senses, and who does not yet hold to them the relationship of the Holy Ghost. His friends have seen Him, heard His doctrine, seen His miracles, and have thereby been brought to believe in Him. But Christ Himself sternly rebukes those who demand miracles of Him; if He thus be made as God to man, God in the heart of man, He cannot have a sensuous and immediate presence. The Dalai-lama, in the form of a sensuous man, is God to the inhabitants of Thibet, but in the Christian principle, where God dwells in the hearts of men, He cannot be present to them in sensuous form.

The second point then is that the sensuous and present form must disappear, so that it may be taken into the Mnemosyne, into the realm of popular conception; then for the first time can the spiritual consciousness, the spiritual relation, enter in. To the question of whither Christ has gone, the answer is given, "He sits on the right hand of God," which signifies that it is only now that God can be known as this concrete One, as the One who has the other moment, His Son (λόγος, σοφία), in Himself. Thus to know what is the principle of Christianity as truth, the truth of the Idea of spirit must be known as concrete spirit, and this is the form peculiar to the Fathers of the Church. With this the idea that the abstractly divine breaks up and has broken up within itself, first began to appear. This other moment in the divine must not, however, be grasped in the mode of an intelligible world, or, as we certainly have it in the ordinary conception, of a kingdom of heaven with many angels, who are also finite, limited, thus approaching closer to humanity. But it is not sufficient that the concrete moment should be known in God, for the further knowledge is requisite that Christ is an actual present man. This moment of Christ's actual present humanity is of

immense importance to Christianity, because it is the union of the most tremendous opposites. This higher conception could not have been present in the text, in the first manifestation; the greatness of the Idea could only come in later on, after the Spirit had perfected the Idea.

That the revelation of Christ has this significance is the belief of Christians, while the profane, immediate and direct significance of this history is that Christ was a mere prophet and met the fate of all the prophets in being misunderstood. But the fact that it has the significance given by us is known through the Spirit, for the Spirit is revealed in this history. This history is the Notion, the Idea of Spirit itself, and the world-history has in it found its end, which is in this immediate way to know the truth. It is therefore the Spirit which so comprehends that history, and at the time of Pentecost this is shown in an immediate and evident manner. For before this time the Apostles did not know the infinite significance of Christ; they did not yet know that this is the infinite history of God; they had believed in Him, but not yet as seeing in Him this infinite truth.

This is the truth which the Fathers developed; the general relation of the first Christian Church to Philosophy is hereby given. On the one hand, the philosophic Idea has been transplanted into this religion; on the other, this moment in the Idea — according to which the latter breaks up within itself into wisdom, the active Logos, the Son of God, &c., but yet in so doing remains in universality — has been brought to a culmination in subjectivity, and further in the sensuous immediate individuality and present existence of a human individual appearing in time and space. These two elements are essentially intermingled in this Christian system, the Idea itself, and secondly the form as it presents itself through its connection with a single individuality present in time and space. To the Fathers this history had thus the Idea as its principle; the true Idea of the Spirit was consequently to them likewise in the determinate form of history. But the Idea was not yet, as

such, separated from history; because the Church thus held to this Idea in historic form, it determined the doctrines. This, then, is the general character of the time.

From this Idea as comprehended through the Spirit, many so-called heresies arose in the first centuries after Christ. Among such heretics must be included those of the Gnostics who take the Christian literature as their basis, but give a spiritual significance to everything therein present. For they did not remain at this historical form of the Idea of Spirit, since they interpreted the history and deprived it of its historical value. The reflections which they introduced are, as we have seen (Vol. II., pp. 396-399), to a greater or less extent such as are to be found in the philosophy of the Alexandrians or of Philo. In conformity with their principles they adopted a speculative attitude, but they proceeded into extravagances both of the imagination and morality, although in this dim fantastic region the elements which we found in history may always be recognized. But the form of immediate existence, an essential moment in Christ, is by them etherealized into a universal thought, so that the determination of the individual as a 'this' disappears. The Docetæ, for example, said that Christ had only a phantom body, a phantom life; yet in such assertions thought still constituted the background. The Gnostics were thus antagonistic to the Western Church, and, like Plotinus and the Neo-Platonists, this last strove hard against Gnosticism, because it remained in what is general, grasped the conception in the form of imagination, and because this conception was opposed to that of Christ in the Flesh (Χριστὸς ἐν σαρκί).[1] The Church, on the contrary, held to the definite form of personality as the principle of concrete actuality.

From the East other forms of opposition in the principles than those we mentioned in connection with the Gnostics have been introduced, namely, Light and Darkness, Good and Evil. But more particularly has this Parsee

opposition emerged in Manichæism, in which God, as the Light opposes the evil, non-existent (οὐκ ὄν), the ὕλη, the material, self-annihilating. Evil is that which contains contradiction in itself: the powers of evil (ὕλη), given over to themselves and raging in blind enmity against one another, were met by a gleam from the Kingdom of Light and thereby attracted, and this light pacified the powers of evil, so as to cause them to cease from strife and unite together in order to penetrate into the Kingdom of Light. As an inducement to make them so act, in order to weaken and mitigate their blind fury through a power operating irresistibly, and in order to bring about their final overthrow, and the universal supremacy of light, of life, of the soul, the Father of Light delivered over one of the powers of good. That is the world-soul (ψυχὴ ἁπάντων); it was swallowed up by the material, and this intermixture is the basis of the whole creation. Hence the soul is everywhere disseminated, and in the dead husk it is everywhere working and striving in man, the microcosm, as in the universe, the macrocosm, but with unequal power; for where beauty reveals itself, the Light-principle, the soul, obtains the mastery over matter, but in the ugly, the hateful, it is subordinate, and matter is the conqueror. This captive soul Mani likewise called the Son of Man — that is, of the primitive man, the heavenly man, of Adam Kadmon. But only a part of the Light-principle which was destined to strive with the Kingdom of Evil is in this manner delivered over; being too weak, it incurred the danger of being vanquished, and had to deliver over to matter a part of its armour, this soul. The part of the soul which had not suffered through such intermingling with matter, but had raised itself freely to heaven, works from above for the purification of the imprisoned souls, its kindred portions of light; and that is Jesus, the Son of Man, in so far as he has not suffered (ἀπαθής), as distinguished from the suffering Son of Man, the soul confined within the universe. But that delivering soul remains in the second and visible light which is still distinguished from the

first and unapproachable, having its seat there, and by means of sun and moon exercising influence in the purification of nature. To Mani the whole course of the physical as of the spiritual world appears as a process of purification by means of this soul. The captive principle of Light required to be raised from the cycle of metempsychosis to an immediate re-union with the Kingdom of Light. Hence the pure heavenly soul came down to earth and appeared in the semblance of human form in order to reach to the suffering soul (to the νοῦς παθητικός of Aristotle?) a helping hand. The Manichæans also express themselves to the effect that God, the Good, goes forth, illumines, and thus produces an intelligible world. What comes third is Spirit as turning round, establishing the unity of the second and first, and experiencing feeling, and this feeling is Love. This heresy fully recognizes the Idea, but does away with the form of individual existence in which the Idea is presented in the Christian religion. The crucifixion of Christ is consequently taken as merely a semblance, as allegorical only, simply an image. That merely phantom crucifixion of the non-suffering Jesus, the fellow-suffering, only imaginary certainly, of the soul unmingled with matter, shows forth the actual suffering of the captive soul. Thus as the forces of Darkness could exercise no power over Christ, they must also show themselves powerless over the soul allied thereto. With the Manichæans originates the conception of a Jesus who is crucified in all the world and in the soul; the crucifixion of Christ thus mystically signifies only the wounds of our suffering souls. Through vegetation the particles of light were held fast, and thus held fast they were brought forth as plants. The earth becoming fruitful brings forth the suffering (*patibilis*) Jesus, who is the life and salvation of men and is crucified on every tree. The νοῦς which appeared in Jesus signifies all things.[2] The Church has likewise made a principal point of asserting the unity of the divine and human nature. But because this unity in the Christian religion attained to conceiving

consciousness, human nature was in its actuality taken as ‘this,’ and not merely in an allegorical or philosophic sense.

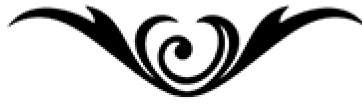
Now if, on the one hand, the essential matter with the orthodox Fathers who opposed themselves to these Gnostic speculations, is the fact that they held firmly to the definite form of an objectively conceived Christ, on the other hand they attacked the Arians and all that pertain to them; for these recognize the individual as manifested, but do not place the Person of Christ in connection with the separation, with the breaking up of the divine Idea. They took Christ to be a man, accorded to Him indeed a higher nature, not, however, making Him a moment of God, of Spirit itself. The Arians did not indeed go so far as the Socinians, who accepted Christ merely as a man of noble nature, a teacher, and so on; this sect hence did not form part of the Church at all, being simply heathen. But still the Arians, since they did not recognize God in Christ, did away with the idea of the Trinity, and consequently with the principle of all speculative philosophy. The according to Him of a higher nature is likewise a hollow mockery which cannot satisfy us; as against this the Fathers accordingly asserted the unity of the divine and human nature, which has come to consciousness in the individual members of the Church, and this is a point of fundamental importance. The Pelagians again, denied original sin, and maintained that man has by nature sufficient virtue and religion. But man should not be what he is by nature; he should be spiritual. And thus this doctrine is likewise excluded as heretical. Therefore the Church was ruled by Spirit, to enable it to hold to the determinations of the Idea, though always in the historic form. This is the philosophy of the Fathers; they produced the Church, as the developed Spirit required a developed doctrine, and nothing is so out of place as the endeavour or desire of some men of the present day to lead the Church back to her original form.

What follows thirdly is that the Idea permeates reality, is immanent therein, that not only is there a multitude of believing hearts, but that from the heart, just as the natural law rules over a sensuous world, a higher life of the world, a kingdom, is constituted — the reconciliation of God with Himself is accomplished in the world, and not as a heavenly kingdom that is beyond. This community is the kingdom of God upon earth in the Church; "Where two or three are gathered together in my name," says Christ, "there am I in the midst of them." The Idea is only for spirit, for subjective consciousness, in so far as it realizes itself in actuality, and thus it not only has to bring itself to perfection in the heart, but has to perfect itself also into a kingdom of actual consciousness. The Idea which man, self-consciousness, should recognize, must become altogether objective to him, so that he may truly apprehend himself as spirit and the Spirit, and then that he may be spiritual in a spiritual, and not in an emotional way. The first objectification is found in the first immediate consciousness of the Idea, where it appeared as an individual object, as the individual existence of a man. The second objectivity is the spiritual worship and communion extended to the Church. We might imagine a universal community of Love, a world of piety and holiness, a world of brotherly kindness, of innocent little lambs and pretty triflings with things spiritual, a divine republic, a heaven upon earth. But this is not supposed to come to pass on earth; that imagination is relegated to heaven, *i.e.* to some other place, that is to say, it is put off until death. Each living actuality directs his feelings, actions, and affairs in a very different way from this. On the appearance of Christianity it is first of all said: "My kingdom is not of this world;" but the realization has and ought to be in the present world. In other words the laws, customs, constitutions, and all that belongs to the actuality of spiritual consciousness should be rational. The kingdom of rational actuality is quite a different one, and must be organized and developed thinkingly and with

understanding; the moment of the self-conscious freedom of the individual must maintain its rights against objective truth and objective command. This, then, is the true and actual objectivity of mind in the form of an actual temporal existence as state, just as Philosophy is the objectivity of thought which comes to us in the form of universality. Such objectivity cannot be in the beginning, but must come forth after being worked upon by mind and thought.

In Christianity these absolute claims of the intellectual world and of spirit had become the universal consciousness. Christianity proceeded from Judaism, from self-conscious abjectness and depression. This feeling of nothingness has from the beginning characterized the Jews; a sense of desolation, an abjectness where no reason was, has possession of their life and consciousness. This single point has later on, and in its proper time, become a matter of universal history, and into this element of the nullity of actuality the whole world has raised itself, passing out of this principle indeed, but also into the kingdom of Thought, because that nothingness has transformed itself into what is positively reconciled. This is a second creation which came to pass after the first; in it Mind became aware of itself as I = I, that is, as self-consciousness. This second creation has first of all appeared in self-consciousness equally directly in the form of a sensuous world, in the form of a sensuous consciousness. As much of the Notion as has entered in was adopted by the Fathers from the philosophers already mentioned; their Trinity, in so far as a rational thought, and not a mere ordinary conception, comes from these, and certain other ideas also. But what mainly distinguishes them is the fact that for the Christian this intelligible world had likewise this immediate sensuous truth of an ordinary course of events — a form which it must have and retain for the majority of men.

3. This new world has therefore, however, to be adopted by a new race of men, by Barbarians; for it is characteristic of barbarians to apprehend the spiritual in a sensuous way. And it must be by northern barbarians, for it is the northern self-containedness alone that is the immediate principle of this new world-consciousness. With this self-consciousness of the intelligible world as a world immediately actual, mind, having regard to what it has in itself become, is higher than before, but, on the other side, in respect of its consciousness it is thrown quite back to the beginning of culture, and this consciousness had to commence from the beginning again. What it had to overcome was on the one hand this sensuous immediacy of its intelligible world, and secondly the opposed sensuous immediacy of actuality, by its consciousness held as null. It excludes the sun, replaces it with tapers, is furnished with images merely; it is in itself alone, and inward, not reconciled for consciousness — to self-consciousness a sinful, wicked world is present. For the intelligible world of Philosophy had not yet completed in itself the task of making itself the actual world — of recognizing the intelligible in the actual, as well as the actual in the intelligible. It is one thing to have the Idea of Philosophy, to recognize absolute essence as absolute essence, and quite another thing to recognize it as the system of the universe, of nature, and of individual self-consciousness, as the whole development of its reality. The Neo-Platonists had found that principle of realization — namely, this real substance which again places itself in quite opposed, though in themselves real determinations — but having got so far they did not find the form, the principle of self-consciousness.



On the Teutonic nations the world-spirit imposed the task of developing an embryo into the form of the thinking man. What comes first is the mind as apprehended, and to that is opposed the subjectivity of will which has not

been taken up into mind; the kingdom of truth and that of the world are bound together and at the same time evidently divided. An intelligible world has thus in the conception of men established itself in the mode of this same actuality, like a far-away land that is just as really conceived of by us, peopled and inhabited, as the world we see, but which is hidden from us as though by a mountain. It is not the Greek or any other world of gods and of mythology — a simple, undivided faith; for there is likewise present in it the highest negativity, that is, the contradiction between actuality and that other world. This intellectual world expresses the nature of real absolute existence. It is on it that Philosophy tries its powers, and on it that thought also moils and toils. We have in general outline to deal with these not very pleasing manifestations.

Our first view of Philosophy, as revealed in Christianity (pp. 10-21) is that of a dim groping which is carried on within the depths of the Idea — as being the forms assumed by the same, which constitute its moments; we see a hard struggle made by reason, which cannot force its way out of the imagination and popular conceptions to the Notion. There is no venture too rash for the imagination to undertake, because, impelled by reason, it cannot satisfy itself with beautiful images, but has to pass beyond them. There is likewise no extravagance of reason into which it does not fall, because it cannot obtain the mastery of the image, but within this element is merely in the act of warfare with it. Later on than this Western self-immersion, there arose in the East expansion, negation of all that is concrete, abstraction from all determinations; this pure contemplation or pure thought present in Mohammedanism corresponds to the Christian descent into self. Within Christianity itself, however, the intellectual world is set in opposition to that first Cabalistic principle; in it pure conceptions rule which constitute the ideas present in thought, and with this we enter upon the Scholastic philosophy. Philosophy, like the arts and sciences, when, through the rule of

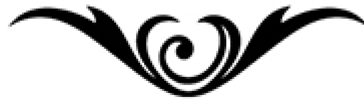
the Barbarians of Germany, they became dumb and lifeless, took refuge with the Arabians, and there attained a wonderful development; they were the first sources from which the West obtained assistance. Through the presupposition of the immediately present and accepted truth, thought had lost its freedom and the truth its presence in conceiving consciousness; and philosophy sank into a metaphysics of the understanding and into a formal dialectic. We have thus in this period first of all to consider philosophy in the East, and secondly in the West; that is, the philosophy of the Arabians first, and subsequently the philosophy of the Schools. The Schoolmen are the principal figures in this period; they represent European philosophy in the European Middle Ages. The third stage is the dissolution of what is upheld in the scholastic philosophy; new meteor-like apparitions are now seen, which precede the third period, the genuine revival of free Philosophy.

SECTION ONE. Arabian Philosophy

IN THE WEST the Germanic tribes had obtained possession of what had hitherto formed a section of the Roman Empire, and their conquests were attaining to shape and solidity, when another religion dawned in the East, namely the Mohammedan. The East purified itself of all that was individual and definite, while the West descended into the depths and actual presence of spirit. As quickly as the Arabians with their fanaticism spread themselves over the Eastern and the Western world, so quickly were the various stages of culture passed through by them, and very shortly they advanced in culture much farther than the West. For in Mohammedanism, which quickly reached its culminating point, both as regards external power and dominion and also spiritual development, Philosophy, along with all the other arts and sciences, flourished to an extraordinary degree, in spite of its here not displaying any specially characteristic features. Philosophy was fostered and cherished among the Arabians; the philosophy of the Arabians must therefore be mentioned in the history of Philosophy. What we have to say, however, chiefly concerns the external preservation and propagation of Philosophy. The Arabians became acquainted with Greek philosophy mainly through the medium of the Syrians in Western Asia, who had imbibed Greek culture, and who were under the Arabian sway. In Syria, which formed a Greek kingdom, at Antioch, especially in Berytus and Edessa, there were great institutes of learning; and thus the Syrians constituted the connecting link between Greek philosophy and the Arabians. Syrian was the language of the people even in Bagdad.[3]

Moses Maimonides, a learned Jew, gives further historical particulars in his *Doctor Perplexorum* of this transition of Philosophy to the Arabians. He says: “All that the Ishmaelites have written of the unity of God and other philosophic dogmas” — especially the sect of the Muatzali (מעתוזלה, *i.e.* the Separated), who were the first to take an interest in the abstract intellectual knowledge of such subjects, while the sect Assaria (האשעריה) arose later—“is based upon arguments and propositions which have been taken from the books of the Greeks and Aramæans” (Syrians), “who strove to refute and deny the teachings of the philosophers.” The cause of this is as follows: The Christian community came to include within it these nations also, and the Christians defended many dogmas which were contradictory of philosophic tenets; among these nations, however, the teachings of philosophers were very widely and generally diffused (for with them Philosophy had its origin), and kings arose who adopted the Christian religion. The Christian Greeks and learned Aramæans, therefore, when they perceived that their doctrines were so clearly and plainly refuted by the philosophers, thought out a wisdom of their own, the “Wisdom of the Words” (Devarim), and they themselves received on that account the name of the Speakers (Medabberim, מְדַבְּרִים). They set up principles which served the purpose both of confirming their faith and of refuting the opposite teaching of the philosophers. When the Ishmaelites followed and attained supremacy, and the books of the philosophers themselves fell into their hands, and along with them the answers which “Christian Greeks and Aramæans had written against the philosophic books, as for instance the writings of Johannes Grammaticus, Aben Adi, and others, they eagerly laid hold of these and adopted them bodily.”[4] Christians and Ishmaelites felt the same need of philosophy; the Ishmaelites, moreover, strove all the more eagerly after knowledge of this kind, because their first desire was to defend

Mohammedanism against Christianity, which was the religion of a large proportion of the nations they had conquered.



The external sequence of events is this. Syriac versions of Greek works were to be had, and these were now translated into Arabic by the Arabians; or translations were made from the Greek directly into Arabic. In the reign of Harun al-Raschid several Syrians are named who lived in Bagdad, and who had been called upon by the Caliphs to translate these works into Arabic. They were the first scientific teachers among the Arabians, and were chiefly physicians; hence the works they translated were on medicine. Among these translators was Johannes Mesue of Damascus, who lived in the reigns of Al-Raschid (*d.* A.D. 786), Al-Mamun (*d.* A.D. 833) and Al-Motawakkil (*d.* A.D. 847), rather earlier than the rise of the Turks to supremacy (A.D. 862); he was a hospital superintendent in Bagdad. Al-Raschid appointed him to make translations from Syriac into Arabic; he opened a public school for the study of medicine and all the sciences then known. Honain was a Christian, as was also his master Johannes, and belonged to the Arab tribe Ebadi; he applied himself to the study of Greek, and made a number of translations into Arabic, and also into Syriac, for example, Nicolaus *De summa philosophiæ Aristotelicæ*, Ptolemy, Hippocrate and Galen. Another is Ebn Adda, an eminent dialectician, who is quoted by Abulfaraj.[5] Among the works of the Greek philosophers it was almost exclusively the writings of Aristotle which were translated by these Syrians, and the later commentaries on the same. It was thus not the Arabians themselves who translated the above works.

In the Arabic philosophy, which shows a free, brilliant and profound power of imagination, Philosophy and the sciences took the same bent that they had taken earlier among the Greeks. Plato with his Ideas or universals laid the foundation of the independent world of intellect, and established absolute existence as an existence which is manifestly present in the mode

of thought; Aristotle developed, completed and peopled the realm of thought; the Neo-Platonic philosophy reached the further conception of the intelligible world as Idea of the existence which is independent in itself, of spirit; and then this first Idea, which we have already met with in connection with Proclus, passed over into a similar Aristotelian development and completion. Consequently it is the Alexandrian or Neo-Platonic Idea which forms the essential principle or basis of the Arabian as well as the Scholastic philosophy, and all that Christian philosophy offers; it is on it that the determinations of the Notion expend their strength, and around this that they career. A particular description of Arabian philosophy has in some parts but little interest; in other parts it will be found that the main dogmas of this philosophy have much in common with those of the Scholastics.

We may say of the Arabians that their philosophy constitutes no characteristic stage in the development of philosophy. The principal points in this, as in the later philosophy, were the question whether the world is eternal, and the task of proving the unity of God and similar dogmas. One great consideration in all this, however, was to defend the doctrines of Mohammedanism, and owing to this all philosophizing had to be carried on within the limits of these doctrines. The Arabians, like the Christians of the West, were restricted by the dogmas of their Church (if one may call it so), few though these dogmas were; yet this last circumstance of the small number of the dogmas certainly gave them greater liberty. But according to all that we know of them, they established no principle of self-conscious reason that was truly higher, and thus they brought Philosophy no further. They have no other principle than that of revelation, therefore only a principle that is external.

A. Philosophy of the Medabberim.

THE MEDABBERIM ARE specially mentioned by Moses Maimonides as a widely extended philosophic school or sect of considerable eminence. He speaks (More Nevochim, P. I. c. 71, pp. 134, 135) of the peculiarity of their method of philosophy somewhat as follows: “The Ishmaelites, however, have extended their discourses still further, and have aspired to other wonderful doctrines, of which none of the Greek Medabberim knew anything, because they were still on some points in agreement with the philosophers. The main point to be remarked is that all the Medabberim, whether among the Greeks who had become Christians, or among the Ishmaelites, in the building up of their principles did not follow the nature of the matter itself, or draw their arguments from it, but only had in view how the subject must be regarded in order to support their assertion, or at least not to refute it altogether: afterwards they boldly asserted that these were the circumstances of the case, and adduced further arguments and maxims in support of their object. They insisted on that, and that alone, which concurred with their opinions, even though it were in the most remote degree, through a hundred links of reasoning. The earliest of their learned men adopted this practice, though professing that they reached these reflections through speculation alone, without reference to any preconceived opinion. Their successors did not follow their example,” &c.

In the pure philosophy of the so-called “Speakers” was expressed the principle, peculiar to the Oriental mind, of the dissolution of definite thought in all its consequences as the dissolution of all connection and relation. Maimonides says (P. I. c. 71, p. 135; c. 73, p. 149): “The ground-principle of the Medabberim is that men can have no certain knowledge of

the nature of things, because in the understanding the contrary may ever exist and be thought. Besides this they in the majority of instances confound imagination with understanding, and give to the former the name of the latter. They adopted as a principle, atoms and empty space," where all connection appears as something contingent. "Production is nothing but a connection of atoms, and decay nothing but a separation of the same; and time consists of many 'nows.'" In this way nothing but the atom really exists. They have thus in the more advanced cultivation of thought brought to consciousness the main standpoint, then as now the standpoint of the Orientals — that of substance, the one substance. This pantheism, or Spinozism, if you like to call it so, is thus the universal view of Oriental poets, historians and philosophers.

The Medabberim go on to say: "Substances, *i.e.* individuals, which," for the rest, "are created by God, have many accidental qualities, as in snow every particle is white. But no quality can endure for two moments; as it comes, it goes again, and God creates another and yet another in its place." All determinations are thus fleeting or perishable; the individual alone is permanent. "If it pleases God to create another quality in a substance, it continues; but if He ceases to create, the substance perishes." Thereby all necessary connection is done away with, so that Nature has no meaning. "They therefore deny that anything exists by nature, likewise that the nature of this or that body necessitates that it should have certain qualities rather than others. But they say that God creates all qualities instantaneously, without natural means and without the help of anything else." General permanence is substance, and the particular is altered every moment, and so exists through the substance. "According to this principle they say, for instance, that when we think we have dyed a garment red with red dye we have not dyed it red at all; for God created the red colour in the garment at the very moment at which we thought we had brought about the result with

the red dye. God observes the invariable custom of not permitting that the colour black should be produced except when the garment is dyed with that hue; and the first colour which comes to pass on the occasion of the connection is not permanent, but disappears on the instant, and every moment another appears which is created in its turn. In the same way knowledge also is an accident, which is created by God at every moment that I know anything; to-day we no longer possess the knowledge which we yesterday possessed. A man," when writing, "does not move the pen when he thinks he moves it, but the motion is an accident of the pen, created by God at the moment." In this way God alone is in truth the operative cause; but He might have made everything differently. "Their eighth proposition is to the effect that nothing but substance or accident exists, and natural forms are themselves accidents; substances alone are individuals. The ninth proposition is that accidents have nothing to do with one another; they have no causal connection or other relation; in every substance all accidents may exist. The tenth proposition is transition (אִפְּשָׁרוּת, *transitus*, *possibilitas*):" "All that we can fancy may also pass over into the understanding, *i.e.* be possible. But in this way everything is possible," since there are no laws of the understanding; this transition of thought is thus perfectly accidental. "A man as large as a mountain, a flea as large as an elephant, are possible. Everything may just as well be something else as what it is, and there is no reason at all why anything should be one way rather than another. They term it a mere habit that the earth revolves round a centre-point, that fire moves upward and that it is hot; it is just as possible, they say, that fire should be cold."[6]

We thus see an utter inconstancy of everything; and this whirl of all things is essentially Oriental. But at the same time this is certainly also a complete dissolution of all that pertains to reasonableness, in harmony of course with Eastern exaltation of spirit, which allows of nothing definite.

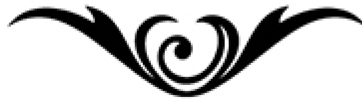
God is in Himself the perfectly undefined, His activity is altogether abstract, and hence the particulars produced thereby are perfectly contingent; if we speak of the necessity of things, the term is meaningless and incomprehensible, and no attempt should be made to comprehend it. The activity of God is thus represented as perfectly devoid of reason. This abstract negativity, combined with the permanent unity, is thus a fundamental conception in the Oriental way of looking at things. Oriental poets are in a marked degree pantheists; the pantheistic is their ordinary point of view. Thus the Arabians developed the sciences and philosophy, without further defining the concrete Idea; their work is rather the dissolution of all that is definite in this substance, with which is associated mere changeableness as the abstract moment of negativity.

B. Commentators of Aristotle.

THE ARABIANS, MOREOVER, made a point for the most part of studying the writings of Aristotle very diligently, and of availing themselves more especially both of his metaphysical and logical writings, and also of his *Physics*; they occupied themselves particularly with multiplying commentaries on Aristotle, and developing still further the abstract logical element there present. Many of these commentaries are still extant. Works of this kind are known in the West, and have been even translated into Latin and printed; but much good is not to be got from them. The Arabians developed the metaphysics of the understanding and a formal logic. Some of the famous Arabians lived as early as the eighth and ninth centuries; their progress was therefore very rapid, for the West had as yet made very little advance in culture.

Alkendi, who wrote a commentary on the *Logic*, flourished in and about A.D. 800, under Almamun.[7] Alfarabi died in 966; he wrote commentaries on Aristotle's *Organon*, which were made diligent use of by the Scholastics, and was also author of a work "On the Origin and Division of the Sciences." It is related of him that he read through Aristotle's treatise *On Hearing* forty times, and his *Rhetoric* two hundred times, without getting at all tired of them;[8] he must have had a good stomach. The very physicians made a study of philosophy, and formulated theories; among them was Avicenna (*b.* A.D. 984, *d.* A.D. 1064), who belonged to Bokhara, to the east of the Caspian Sea; he wrote a commentary on Aristotle.[9] Algazel (*d.* A.D. 1127 at Bagdad) wrote compendiums of logic and metaphysics; he was a sceptic of great ability, with a powerful mind of the Oriental cast; he held the words of the Prophet to be pure truth, and wrote *Destructio*

Philosophorum.[10] Tofail died in Seville in A.D. 1193.[11] Averroës, who died A.D. 1217, was specially distinguished as the commentator of Aristotle.[12]



The acquaintance of the Arabians with Aristotle has this interest in history that it was thus that Aristotle first became known also in the West. The commentaries on Aristotle and the collections of passages from his writings become thus for the Western world a fountain of philosophy. Western nations long knew nothing of Aristotle, excepting through such retranslations of his works and translations of Arabian commentaries on them. For such translations were made from Arabic into Latin by Spanish Arabs, and especially by Jews in the south of Spain and Portugal and in Africa; there was often even a Hebrew translation between.

C. Jewish Philosophers.

WITH THE ARABIANS are closely connected the Jewish philosophers, among whom the above-mentioned Moses Maimonides held a distinguished place. He was born at Cordova, in Spain, A.D. 1131 (Anno Mundi 4891, or, according to others, 4895), and lived in Egypt.[13] Besides *More Nevochim*, which has been translated into Latin, he composed other works; of him and other Jews much more of a literary character might be said. In their philosophy a strong Cabalistic element, on the one hand, makes itself felt throughout, in astrology, geomancy, &c.; on the other hand, we find in Moses Maimonides, as in the Fathers, that the foundation is laid in history. He deals with this in a strictly abstract system of metaphysics, which is connected, in Philo's fashion, with the Mosaic books and their interpretation. We find in these Jewish philosophers proofs brought forward that God is One, that the world was created, and that matter is not eternal; Maimonides also speaks of the nature of God. The unity of God is dealt with as it was among the ancient Eleatics and the Neo-Platonists; to prove, namely, that not the Many, but the self-begetting and self-abrogating One is the truth.[14]

SECTION TWO. The Scholastic Philosophy

ALL THE PHILOSOPHY which we first encounter in the Middle Ages, when independent states begin to rise, consists of bare remnants of the Roman world, which on its Fall had sunk in all respects so low that the culture of the world seemed to have come entirely to an end. Thus in the West hardly anything was known beyond the Isagoge of Porphyry, the Latin Commentaries of Boethius on the Logical works of Aristotle, and extracts from the same by Cassiodorus — most barren compilations; there is also what is just as barren, the dissertations ascribed to Augustine *De dialectica* and *De categoriis*, which last is a paraphrase of the Aristotelian work upon the categories.[15] These were the first make-shifts or expedients for carrying on Philosophy; in them the most external and most formal reasoning is applied.

The whole effect of the scholastic philosophy is a monotonous one. In vain have men hitherto endeavoured to show in this theology, which reigned from the eighth or even sixth century almost to the sixteenth, particular distinctions and stages in development. In this case as in that of the Arabian philosophy, time does not allow — and if it did the nature of things would not allow — us to separate the scholastic philosophy into its individual systems or manifestations, but only to give a general sketch of the main elements present therein which it has actually taken up into thought. It is not interesting by reason of its matter, for we cannot remain at the consideration of this; it is not a philosophy. The name, however, properly speaking indicates a general manner rather than a system — if we may speak of a philosophic system. Scholasticism is not a fixed doctrine like Platonism or Scepticism, but a very indefinite name which comprehends the philosophic

endeavours of Christendom for the greater part of a thousand years. However, this history which occupies nearly a thousand years is, as a matter of fact, comprised within one Notion which we propose to consider more closely; it has ever occupied the same standpoint, and been grounded on the same principle; for it is the faith of the Church that we catch sight of, and a formalism which is merely an eternal analysis and constant re-iteration within itself. The more general acceptance of the Aristotelian writings has merely brought forth a difference of degree and caused no real scientific progress. Here there is indeed a history of men, but speaking properly none of scientific knowledge; the men are noble, pious, and in all respects most distinguished.

The study of the scholastic philosophy is a difficult one, even if its language only be considered. The Scholastics certainly make use of a barbaric Latin, but this is not the fault of the Scholastics but of their Latin culture. Latin forms a quite unsuitable instrument for applying to philosophic categories such as these, because the terms which the new culture adopts could not possibly be expressed by this language without unduly straining it; the beautiful Latin of Cicero is not adapted for use in profound speculations. It cannot be expected of anyone to know at first hand this philosophy of the Middle Ages, for it is as comprehensive and voluminous as it is barren and ill-expressed.

Of the great schoolmen we still have many works left to us which are very lengthy, so that it is no easy task to study them: the later they are, the more formal do they become. The Schoolmen did not only write compendiums — for the writings of Duns Scotus amount to twelve, and those of Thomas Aquinas to eighteen folios. Abstracts of them are to be found in various works. The principal sources from which we obtain our knowledge are: 1, Lambertus Danæus in the Prolegomena to his *Commentarius in librum primum sententiarum Petri Lombardi, Genevæ,*

1580. (This is the best authority we have in abridged form); 2, Launoi: *De varia Aristotelis in Academia Parisiensi fortuna*; 3, Cramer: Continuation of Bossuet's History of the World, in the last two volumes; 4, the *Summa* of Thomas Aquinas. In Tiedemann's History of Philosophy extracts from the Scholastics are also to be found, as likewise in Tennemann; Rixner also makes judicious extracts.

We shall limit ourselves to general points of view. The name finds its origin in this way. From the time of Charles the Great it was only in two places — in the great schools attached to the great cathedral churches and monasteries — that a cleric, that is a canon who had the oversight of the instructors (*informatores*), was called *scholasticus*; he likewise gave lectures on the most important branch of science, theology. In the monasteries he who was the most advanced instructed the monks. We have not, properly speaking, to deal with these; but although scholastic philosophy was something altogether different, the name of Scholastics attached itself to those alone who propounded their theology scientifically and in a system. In place of the *patres ecclesiæ* there thus arose later on the *doctores*.

The scholastic philosophy is thus really theology, and this theology is nothing but philosophy. The further content of theology is merely that which is present in the ordinary conceptions of religion; theology, however, is the science of the system as it must necessarily be present within every Christian, every peasant, &c. The science of theology is often placed in an external historical content, in exegesis, in the enumeration of the various manuscripts of the New Testament, in considering whether these are written on parchment, cotton fabrics or paper, whether in uncial letters or otherwise, and which century they belong to; further matters for consideration are the Jewish conceptions of time, the history of the Popes, Bishops and Fathers, and what took place at the councils of the Church. All

these matters, however, do not pertain to the nature of God and its relation to mankind. The one essential object of theology as the doctrine of God, is the nature of God, and this content is in its nature really speculative; those theologians who consider this are therefore nothing less than philosophers. The science of God is nothing but Philosophy. Philosophy and theology have hence here also been counted one, and it is their separation that constitutes the transition into modern times, seeing that men have thought that for thinking reason something could be true which is not true for theology. Down to the Middle Ages, on the contrary, it was held as fundamental that there should be but one truth. Thus the theology of the scholastics is not to be represented as though, as with us, it merely contained doctrines about God, &c., in historic guise, for in fact it also has within it the profoundest speculations of Aristotle and of the Neo-Platonists. Their philosophy, and much in them that is excellent, is found in Aristotle, only in a simpler and purer form; and to them too the whole lay beyond actuality and mingled with Christian actuality as it is represented to us.

From Christianity, within whose bounds we now have our place, Philosophy has to re-establish its position. In heathendom the root of knowledge was external nature as thought devoid of self, and subjective nature as the inward self. Both Nature and the natural self of mankind, and likewise thought, there possessed affirmative significance; hence all this was good. In Christianity the root of truth has, however, quite another meaning; it was not only the truth as against the heathen gods, but as against Philosophy also, against nature, against the immediate consciousness of man. Nature is there no longer good, but merely a negative; self-consciousness, the thought of man, his pure self, all this receives a negative position in Christianity. Nature has no validity, and affords no interest; its universal laws, as the reality under which the individual existences of nature are collected, have likewise no authority: the

heavens, the sun, the whole of nature is a corpse. Nature is given over to the spiritual, and indeed to spiritual subjectivity; thus the course of nature is everywhere broken in upon by miracles. With this surrender of natural necessity we have the fact associated that all further content, all that truth which constitutes the universal of that nature, is given and revealed. The one starting-point, the contemplation of nature, is thus for knowledge undoubtedly not present. Then this fact is likewise set aside that I am present as a self. The self as this immediate certainty has to be abrogated; it must also merge itself in another self, but in one beyond, and only there does it have its value. This other self, in which the proper self is made to have its freedom, is first of all likewise a particular self, that has not the form of universality: it is determined and limited in time and space, and at the same time has the significance of an absolute in and for itself. A real sense of self is thus abandoned, but what self-consciousness on the other hand gains is not a universal, a thought. In thought I have real affirmative significance, not as an individual, but as universal 'I'; the content of truth is now, however, plainly individualized, and thus the thought of the 'I' falls away. Thereby, however, the highest concrete content of the absolute Idea is set forth, in which the opposites that are plainly infinite are united; it is the power which unites in itself what appears to consciousness infinitely removed from one another — the mortal and the absolute. This absolute is itself 'this' first of all as this concrete, not as abstraction, but as the unity of universal and individual; this concrete consciousness is for the first time truth. The reason of the former content being also true, comes to me as something not pertaining to myself, but as a thing received outside of self. The testimony of spirit, indeed, pertains thereto, and my inmost self is present there; but the testimony of spirit is a thing concealed, which does not further reveal itself, does not beget the content from itself, but receives it. The Spirit which bears witness is further itself distinguished from me as

an individual; my testifying spirit is another, and there only remains to me the empty shell of passivity. Conditioned by this inflexible standpoint, Philosophy had to go forth once more. The first working up of this content, the inward operation of universal thought in the same, is the task scholastic philosophy has to undertake. The opposition between faith and reason forms the end arrived at; reason, on the one hand, feels the necessity of setting to work on nature in order to obtain immediate certainty, and on the other hand of finding in genuine thought, in specific production out of self, this same satisfaction.

We must now speak of the methods and manners of the scholastics. In this scholastic activity thought pursues its work quite apart from all regard to experience; we no longer hear anything of taking up actuality and determining it through thought. Although the Notion came into recognition earlier than this, in Aristotle, in the first place, the Notion was not apprehended as the necessity of carrying the content further; for this was received in its successive manifestations, and there was present merely an intermingling of actuality accepted as truth and of thought. Still less, in the second place, was the greater part of the content permeated by Notions, for this content was taken up superficially into the form of thought — more especially with the Stoics and Epicureans. The scholastic philosophy altogether dissociates itself from any such endeavours; it leaves actuality to exist alongside itself as if it were despised and had no interest. For reason found its true existence, its actualization, in another world and not in this; the whole progress of the cultivated world goes, however, to the re-instalment of a faith in the present world. Nevertheless, at first all knowledge and action, and whatever relates to an interest in this world, were entirely banished. Branches of knowledge that pertain to such ordinary matters as sight and hearing, restful contemplation and occupation with ordinary actuality here found no place; nor did such sciences as recognize a

definite sphere of actuality after their own particular fashion, and constitute the material for genuine philosophy, nor arts which give to the Idea a sensuous existence. Likewise law and right, the recognition of the actual man, were not esteemed as pertaining to the social relationships of life, but to some other sphere. In this absence of rationality in the actual, or of rationality which has its actuality in ordinary existence, is found the utter barbarism of thought, in that it keeps to another world, and does not have the Notion of reason — the Notion that the certainty of self is all truth.

Now thought as sundered has a content, the intelligible world, as an actuality existent for itself, to which thought applies itself. Its conduct is here to be compared with that which takes place when the understanding applies itself to the sensuous and perceptible world, makes it as substance its basis, having a fixed object in it, and reasoning respecting it; it is then not the independent movement of Philosophy proper which penetrates existence and expresses it, for all it does is to find predicates regarding it. The scholastic philosophy has thus the intelligible world of the Christian religion, God and all His attributes and works therewith connected, as an independent object; and thought is directed to God's unchangeableness, to such questions as whether matter is eternal, whether man is free, &c. — just as the understanding passes to and fro over the phenomenal and perceived. Now the scholastic philosophy was here given over to the infinite movement of determinate Notions; the categories of possibility and actuality, freedom and necessity, constitution and substance, &c., are of this nature, they are not fixed, but pure movements. Anything whatever, determined as potential, transforms itself equally into the opposite, and must necessarily be surrendered; and determination can only save itself by a new distinction, because it must, on the one hand, be given up, and on the other retained. The scholastics are thus decried on account of the endless distinctions which they draw. For the sake of these determinations through

the abstract Notion the Aristotelian philosophy was predominant, though not in its whole extent. It was the Aristotelian *Organon* that was held in such favour, and that indeed just as much for its laws of thought as for its metaphysical conceptions — the categories. These abstract Notions constituted in their determinateness the understanding of the scholastic philosophy, which could not pass beyond itself and attain to freedom, nor seize upon the freedom given by reason.

With this finite form a finite content is likewise directly associated. From one determination we pass on to another, and such determinations, as particular, are finite; the determination there relates itself externally and not as self-comprehensive and self-embracing. The result of this determination is that thought will really act as if it brought about conclusions, for to draw conclusions is the mode of formal logical progression. Philosophy thus consists of a methodical and syllogistic reasoning. Just as the Sophists of Greece wandered about amongst abstract conceptions on behalf of actuality, so did the scholastics on behalf of their intellectual world. To the former Being had validity; it they had rescued and delivered as against the negativity of the Notion, while along with that they had justified it through the same. The principal endeavour of the scholastics was in the same way to vindicate the Christian intellectual world as against the confusion of the Notion, and through the latter to demonstrate its conformity with the same. The universal form of the scholastic philosophy thus consisted in this — that a proposition was laid down, the objections to it brought forward, and these contradicted through counter-propositions and distinctions. Philosophy was hence not separated from theology, as it is not in itself, for Philosophy is the knowledge of absolute existence, that is to say, theology. But to that theology the Christian absolute world was a system which was held to be an actuality, as was ordinary actuality for the Greek sophists. Of

Philosophy proper there thus remained only the laws of thought and abstractions.

A. Relationship of the Scholastic Philosophy to Christianity.

PHILOSOPHY WITH THE scholastics had consequently the same quality of want of independence as it had before this with the Christian Fathers and the Arabians. The Church as already constituted established itself amongst the Teutonic nations, and through its constitution it conditioned philosophy. The Christian Church had indeed spread itself abroad throughout the Roman world, but, more especially in the beginning, it merely formed a community of its own, by whom the world was renounced, and which made no special claims to recognition — or if such claims were made they were merely negative, because the individuals in the world were simply martyrs, thus renouncing the world. But the Church in time became dominant, and the Roman emperors, both of the East and of the West, embraced Christianity. Thus the Church attained to a position openly recognized and undisturbed, from which it exercised much influence upon the world. The political world, however, fell into the hands of the Teutonic nations, and thereby a new form arose, and to this the scholastic philosophy pertains. We know the revolution by the name of the Migration of the Nations (*supra*, pp. 23, 24). Fresh races inundated the ancient Roman world and established themselves therein; they thus erected their new world on the ruins of the old — a picture which Rome in its present aspect still presents. There the splendour of the Christian temples is due in part to the remnants of the ancient, and new palaces are built on ruins and have ruins all around.

1. The principal feature in the Middle Ages is found in this disunion, the two sides here present; there are revealed in it two nations, two manners of speech. We see people who have hitherto ruled, a previous world having its

own language, arts, and sciences, and on this to them foreign element the new nations grafted themselves, and these thus started upon their course internally dissevered. In this history we have thus before us not the development of a nation from itself, but one proceeding from its opposite, and one which is and remains burdened by this opposite, and which takes it up into itself and has to overcome it. Hence these people have in this way represented in themselves the nature of the spiritual process. Spirit is the making for itself a presupposition, the giving to itself the natural as a counterpoise, the separating itself therefrom, thus the making it an object, and then for the first time the working upon this hypothesis, formulating it, and from itself bringing it forth, begetting it, internally reconstructing it. Hence in the Roman as in the Byzantine world, Christianity has triumphed as a Church; but neither of these worlds was capable of effectuating the new religion in itself and of bringing forth a new world from this principle. For in both there was a character already present — customs, laws, a juridical system, a constitution (if it can be called constitution), a political condition, capacities, art, science, spiritual culture — in short, everything was there. The nature of spirit, on the contrary, requires that the world thus constituted should be begotten from it, and that this process of begetting should take place through the agency of reaction, through the assimilation of something which has gone before. These conquerors have thus established themselves in a foreign sphere, and have become the rulers over it; but at the same time they have come under the dominion of a new spirit which has been imposed upon them. Although on the one hand predominant, on the other they have come under the dominion of the spiritual element, because they conducted themselves passively in regard to it.

The spiritual Idea or spirituality has become imposed upon the dulness, both in mind and spirit, of these rough barbarians; their hearts were thereby pricked. The rough nature has in this way become immanent in the Idea as

an eternal opposition, or there is kindled in them infinite pain, the most terrible suffering — such that it may even be represented as a crucified Christ. They had to sustain this conflict within themselves, and one side of it is found in the philosophy which later on made its appearance amongst them, and was first of all received as something given. They are still uncultured people, but for all their barbaric dulness they are deep in heart and mind; on them, then, has the principle of mind been bestowed, and along with it this pain, this war between spiritual and natural, has necessarily been instituted. Culture here begins from the most terrible contradiction, and this has to be by it resolved. It is a kingdom of pain, but of purgatory, for that which is in the pain is spirit and not animal, and spirit does not die, but goes forth from its grave. The two sides of this contradiction are really thus related to one another in such a way that it is the spiritual which has to reign over the barbarians.

The true dominion of spirit cannot, however, be a dominion in the sense that its opposite is in subjection to it; spirit in and for itself cannot have the subjective spirit to which it relates confronting it as an externally obedient slave, for this last is itself also spirit. The dominion that exists must take up this position, that spirit is in subjective spirit in harmony with itself. The universal is thus that opposition in which the one can only have supremacy by the subjection of the other, but which already contains the principle of resolution in itself because mind must necessarily bear rule. And hence the consequent development is only this, that mind as reconciliation attains the mastery. To this it pertains that not the subjective consciousness, mind and heart alone, but also the worldly rule, laws, institutions, the human life, in so far as these rest in mind, must become rational. In the Republic of Plato we have met with the idea that the philosophers are those who ought to reign. Now is the time in which it is said that the spiritual are to govern, but this talk about the spiritual has been made to bear the significance that

ecclesiasticism and the ecclesiastics ought to govern. The spiritual is thus made a particular form, an individual, but the real meaning that it bears is that the spiritual as such ought to be the determining factor; and this has passed current until the present day. Thus in the French Revolution we see that abstract thought is made to rule; in accordance with it constitution and laws are determined, it forms the bond between man and man; and men come to have the consciousness that what is esteemed amongst them is abstract thought, and that liberty and equality are what ought to be regarded; in this the subject also has his real value, even in relation to actuality.

One form of this reconciliation is likewise this, that the subject is satisfied with himself and in himself as he stands and moves, with his thoughts, his desires, with his spirituality; and thus that his knowledge, his thought, his conviction, has come to be the highest, and has the determination of the divine, of what holds good as absolute. The divine and spiritual is thus implanted in my subjective spirit, is identical with me; I myself am the universal, and it has efficacy for me only as I directly know it. This form of reconciliation is the newest, but the most one-sided. For the spiritual is not there determined as objective, but is only comprehended as it is in my subjectivity, in my consciousness: my conviction as such is taken as ultimate, and that is the formal reconciliation of subjectivity with itself. If the reconciliation has this form, the point of view of which we spoke before has no longer any interest; it is past and a mere matter of history. If the conviction as it immediately reveals itself within every subject is the true, the absolute, this process of mediation between God, as the true and absolute, and mankind, is no longer in us a necessity. The doctrines of the Christian religion have likewise the position of something foreign, pertaining to a particular time, that with which certain men have occupied themselves. The conception that the Idea is absolutely concrete, and is as

spirit in a relation of opposition to the subject, has disappeared, and only shows itself as having passed away. In so far that which I have said about the principle of the Christian system, and shall still say of the scholastics, has interest only from the standpoint which I have given, when the interest is in the Idea in its concrete determination, and not from the standpoint of the immediate reconciliation of the subject with himself.

2. We have now to consider further the character of the opposition to any agreement with Philosophy; and to do this we must shortly call to mind the historical aspect of the case, although we need only treat of the main points therein. The first matter to consider is the opposition that exists in the world. This form of opposition as it appears in history is as follows. Spirituality as such should be the spirituality of the heart; spirit, however, is one, and thus the communion of those who have this spirituality is asserted. Hence a community arises, which then becomes an external order, and thus, as we have seen (pp. 21, 22), expands into a church. In as far as spirit is its principle, it is, as spiritual, immediately universal, for isolation in feeling, opinion, &c., is unspiritual. The Church organizes itself, but yet it goes forth into worldly existence, attains to riches, possesses goods, and even becomes worldly and imbued with all the brute passions; for the spiritual is merely the original principle. The heart that is set on ordinary existence, on the world, and the whole of such human relationships as are hereby involved, is guided by these inclinations, desires and passions, by all this grossness and vulgarity. Thus the Church merely has the spiritual principle within itself without its being truly real, and in such a way that its further relationships are not yet rational; for such is their character before the development of the spiritual principle in the world. The worldly element without being conformable to the spiritual, is present as existence, and is the immediately natural worldly element; in this way the Church comes to have in itself the immediately natural principle. All the passions it has within

itself — arrogance, avarice, violence, deceit, rapacity, murder, envy, hatred — all these sins of barbarism are present in it, and indeed they belong to its scheme of government. This government is thus already a rule of passion, although it professes to be a spiritual rule, and thus the Church is for the most part wrong in its worldly principles, though right in its spiritual aspect.

Hence the new religion separated our whole conception of the world into two different worlds, the intellectual but not subjectively conceived world, and the temporal world. Therefore life as a whole fell into two parts, two kingdoms. Directly opposite the spiritual worldly kingdom there stands the independent worldly kingdom, emperor against pope, papacy and Church — not a state, but a worldly government; there the world beyond, here the world beside us. Two absolutely essential principles conflict with one another; the rude ways of the world, the ruggedness of the individual will, beget an opposition most terrible and severe. The culture which now begins to show itself is confronted by this incomplete reality, as an actual world in opposition to its world of thought; and it does not recognize the one as present in the other. It possesses two establishments, two standards of measure and of weight, and these it does not bring together but leaves mutually estranged.

The spiritual kingdom likewise has as Church an immediate present of ordinary actuality, but the worldly kingdom, both as external nature and as the real self of consciousness, has no truth or value in itself; for truth, as lying beyond it — the measure of truth that shines in it — is given to it from without as something inconceivable and in itself complete. The worldly kingdom must thus be subject to the spiritual become worldly; the emperor is hence defender and protector of the Church (*advocatus ecclesiæ*). The worldly element, in a certain sense, takes up a position of independence, no doubt, but it is still in unity with the other in such a way that it recognizes the spiritual as dominant. In this opposition a war must

arise both on account of the worldly element which is present in the Church itself, and likewise on account of the directly worldly element of violence and of barbarism in worldly rule as it exists *per se*. The war must at first, however, prove disastrous to the worldly side, for just as its own position is asserted, the other is likewise recognized by it, and it is forced humbly to submit to this last, to the spiritual and its passions. The bravest, noblest emperors have been excommunicated by popes, cardinals, legates, and even by archbishops and bishops; and they could do nothing in self-defence, nor put their trust in outward power, for it was internally broken; and thus they were ever vanquished and finally forced to surrender.

In the second place, as regards morality in the individual, we see on the one hand religion in its truly noble and attractive form in a few isolated individuals alone. I refer to those solitary spirits who are dead to the world and far removed therefrom, who find in their emotions what satisfies them, and, living in a little circle, can limit themselves to the sphere of religion. This is the case with women in the Middle Ages, or with the monks or other solitaries who were able to preserve themselves in a restricted and contracted state of fervour such as this, in which the spiritual side makes itself infinitely felt, although it lacks actuality. The one truth stood isolated and alone in man, the whole actuality of mind was not yet penetrated by it. On the other hand it is, however, essential that mind as will, impulse and passion, should demand quite another position, another mode of venting and realizing itself, than any such solitary and contracted sphere affords, that the world should require a more extended sphere of existence, an actual association of individuals, reason and thought coming together in actual relations and actions. This circle in which mind is realized — the human life — is, however, at first separated from the spiritual region of truth. Subjective virtue partakes more of the character of suffering and privation on its own account, morality is just this renunciation and self-surrender, and

virtue as regards others merely has the character of benevolence, a fleeting, accidental character destitute of relation. All that pertains to actuality is hence not perfected by the truth, which remains a heavenly truth alone, a Beyond. Actuality, the earthly element, is consequently God-forsaken and hence arbitrary; a few isolated individuals are holy, and the others are not holy. In these others we first see the holiness of a moment in the quarter of an hour of worship, and then for weeks a life of rudest selfishness and violence and the most ruthless passion. Individuals fall from one extreme into another, from the extreme of rude excess, lawlessness, barbarism, and self-will, into the renunciation of all things without exception, the conquest of all desires.

The great army of the Crusaders gives us the best example of this. They march forth on a holy errand, but on the way they give free vent to all the passions, and in this the leaders show the example; the individuals allow themselves to fall into violence and heinous sin. Their march accomplished, though with an utter lack of judgment and forethought, and with the loss of thousands on the way, Jerusalem is reached: it is beautiful when Jerusalem comes in view to see them all doing penance in contrition of heart, falling on their faces and reverently adoring. But this is only a moment which follows upon months of frenzy, foolishness and grossness, which everywhere displayed itself on their march. Animated by the loftiest bravery, they go on to storm and conquer the sacred citadel, and then they bathe themselves in blood, revel in endless cruelties, and rage with a brutal ferocity. From this they again pass on to contrition and penance; then they get up from their knees reconciled and sanctified, and once more they give themselves up to all the littleness of miserable passions, of selfishness and envy, of avarice and cupidity: their energies are directed to the satisfaction of their lusts, and they bring to nought the fair possession that their bravery

had won. This comes to pass because the principle is only present in them in its implicitude as an abstract principle, and the actuality of man is not as yet spiritually formed and fashioned. This is the manner in which the opposition in actuality manifests itself.

In the third place, we reach the opposition existing in the content of religion, in the religious consciousness; this has many forms, though we have here only to call to mind those that are most inward. On the one hand, we have the Idea of God — that He is known as the Trinity; on the other, we have worship, *i.e.* the process of individuals making themselves conformable to spirit, to God, and reaching the certainty of entering the kingdom of God. A present and actual church is an actuality of the kingdom of God upon earth, in such a way that this last is present for every man — every individual lives and must live in the kingdom of God. In this disposition we have the reconciliation of every individual; thereby each becomes a citizen of this kingdom, and participates in the enjoyment of this certainty. But this reconciliation is allied to the fact that in Christ the unity of the divine and human nature is shown forth, that is to say, the way in which the spirit of God must be present in man. This Christ thus cannot be one who is past and gone, and the life of reconciliation cannot be a mere recollection of that past. For as the just behold Christ in heaven, so must Christ be an object on earth which may likewise be beheld. In that case this process must be present — the individual must be united to this to him objective form, and it becomes identical with him; the history of Christ, that God reveals Himself as man, sacrifices Himself, and through this sacrifice raises Himself to the right hand of God, is in the individual always being accomplished in the culminating point which is called the sacrifice of the mass. The mediating element to which the individual relates himself in worship, is ever present in the mass as the objective of which the individual must be made to partake, as the Host and the act of partaking of the same.

This Host, on the one hand, as objective, is held to be divine, and, on the other, it is in form an unspiritual and external thing. But that is the lowest depth of externality reached in the Church; for in this perfect externality it is before the thing that the knee must be bowed, and not in as far as it is an object that may be partaken of. Luther changed this way of regarding matters; in what is called the Supper, he has retained the mystical fact that the subject receives the divine element into himself; but he maintains that it is only divine in so far as it is partaken of in this subjective spirituality of faith, and ceases to be an external thing. But in the Church of the Middle Ages, in the Catholic Church generally, the Host is honoured even as an external thing; thus if a mouse eats of the Host, both it and its excrements are reverenced; there the divine element has altogether the form of externality. This is the central point of intense opposition which is on the one hand dissolved, and on the other remains in perfect contradiction, so that the Host, still held to be a merely external thing, must nevertheless be thus high and absolute.

With this externality the other side is connected — the consciousness of this relation — and here we then have the consciousness of what is spiritual, of what is the truth, in the possession of a priesthood. Thus as thing it is naturally also in the possession of another, from whom, since it is something distinguished by itself, it has to receive its distinction — or it must be consecrated — and this last is likewise an external action only, performed by individuals. The power to give this distinction to the thing is in the possession of the Church; from the Church the laity receive it.

But besides all this, the relationship of the subject in himself, the fact that he belongs to the Church and is a true member of the same, must be considered. After the admission of individuals into the Church their participation therein must likewise be brought about — that is, their purification from sin. To this it is, however, essential, in the first place, that

it should be known what evil is, and secondly, that the individual should desire the good and that pertaining to religion; and thirdly, that sin should be committed from an innate and natural sinfulness. Now since what is inward, or conscience, must be of a right nature, the sins that are committed must be removed, and made as though they had not happened; man must ever be purified, baptized anew, so to speak, and received back again: the negation that shuts him out must ever be removed. Against this sinfulness positive commands and laws are now given, so that from the nature of spirit men cannot know what is good and evil. Thus the divine law is an external, which must hence be in someone’s possession; and priests are separated from others, so that they are exclusively acquainted both with the particular details of doctrine and the means of grace, *i.e.* the mode whereby the individual is religious in his worship and comes to know that he participates in the divine. In the same way that the administration of the means of grace belongs as an outward possession to the Church in relation to worship, so is the Church also in possession of a moral estimate for judging of the actions of individuals; it is in the possession of the conscience, as of knowledge as a whole, so that man’s inmost essence, his accountability, passes into other hands and to another person, and the subject is devoid of individuality even in his inmost self. The Church also knows what the individual ought to do; his faults must be known, and another, the Church, knows them; the sins must be taken away, and this also is effected in an external way, through purchase, fasting and stripes, through journeyings, pilgrimages, &c. Now this is a relation of self-suppression, unspirituality and deadness both of knowledge and will, in the highest things as well as in the most trivial actions.

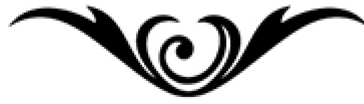
These are the main facts as regards externality in religion itself, on which all further determinations depend.

3. We have now obtained a better idea of the elements present in this philosophy; but in barbaric nations Christianity could have this form of externality alone, and this pertains to history. For the dulness and frightful barbarism of such nations must be met by servitude, and through this service must their education be accomplished. Man serves under this yoke; this fearful discipline had to be gone through if the Teutonic nations were to be raised into spiritual life. But this severe and wearisome service has an end, an object; infinite spring and infinite elasticity, the freedom of spirit, is the prize. The Indians are in equal servitude, but they are irrevocably lost — identified and identical with nature, yet in themselves opposed to nature. Knowledge is thus limited to the Church, but in this very knowledge a positive authority is firmly rooted, and it is a prominent feature of this philosophy, whose first quality is consequently that of lack of freedom. Thought thus does not appear as though it proceeded from itself and was grounded in itself, but as being really independent of self and depending on a given content, the doctrine of the Church — which, although speculative itself, also contains the mode of the immediate existence of external objects.

In theological form it may be said that, in general, the Middle Ages signify the dominion of the Son and not of Spirit; for this last is still in the possession of the priesthood. The Son has differentiated Himself from the Father, and is regarded as remaining in this differentiation, so that the Father in Him is only implicit; but in the unity of both we first reach Spirit, the Son as Love. If we remain a moment too long in the difference without likewise asserting the identity, the Son is the Other; and in this we find the Middle Ages defined and characterized. The character of Philosophy in the Middle Ages is thus in the second place an attempt to think, to conceive, to philosophize under the burden of absolute hypotheses; for it is not the thinking Idea in its freedom, but set forth in the form of an externality. We thus find here in Philosophy the same character as is present in the general

condition of things, and for this reason I before called to mind the concrete character that prevails; for on every period of time one special characteristic is always imprinted. The philosophy of the Middle Ages thus contains the Christian principle, which is the highest incentive to thought, because the Ideas therein present are thoroughly speculative. Of this one side is that the Idea is grasped by the heart, if we call the individual man the heart. The identity of the immediate individuality with the Idea rests in this, that the Son, the mediator, is known as *this* man; this is the identity of spirit with God for the heart as such. But the connection itself, since it is likewise a connection with God in God, is hence immediately mystical and speculative; thus here there is the call to thought which was first of all responded to by the Fathers, and then by the scholastics.

But since, in the third place, there exists the opposition between the doctrine of the Church and the worldly man — who has indeed through thought worked his way out of this same barbarism, but who in his healthy human understanding has not yet penetrated to reason — the mode in which Philosophy was treated at this time for the setting forth of formal thought, has still no concrete content. We may appeal to the human concrete mind; in it we have a living present as thinking and feeling; a concrete content such as this has its root in the thought of man, and constitutes the material for his independent consciousness. Formal thought directs its course by this; the wanderings of abstract reflection have in such consciousness an aim, which sets a limit upon them, and leads them back to a human concrete. But the reflections of the scholastics on such a content depend unsupported on the determinations of formal thought, on formal conclusions; and all the determinations regarding natural relationships, laws of nature, &c., that may issue, receive as yet no sustenance from experience; they are not yet determined by the healthy human understanding. In this respect the content likewise is unspiritual, and these unspiritual relationships are inverted and



carried into the spiritual in so far as advance is made to determinateness of a higher kind. These three points constitute the main characteristics of this philosophy.

More particularly we would shortly deal with the chief representatives of this philosophy. Scholastic philosophy is considered to begin with John Scotus Erigena who flourished about the year 860, and who must not be confused with the Duns Scotus of a later date. We do not quite know whether he belonged to Ireland or to Scotland, for Scotus points to Scotland, and Erigena to Ireland. With him true philosophy first begins, and his philosophy in the main coincides with the idealism of the Neo-Platonists. Here and there stray works of Aristotle were likewise known, even to John Scotus, but the knowledge of Greek was very limited and rare. He shows some knowledge of the Greek and Hebrew tongues, and even of Arabic as well; but we do not know how he attained to this. He also translated from Greek to Latin writings of Dionysius the Areopagite, a later Greek philosopher of the Alexandrian school, who more especially followed Proclus: namely, *De cœlesti hierarchia*, and others which Brucker calls (Hist. crit. phil. T. III. p. 521), *nugæ et deliria Platonica*. Michael Balbus, Emperor of Constantinople, had in the year 824 made a present of these works to the Emperor Louis the Pious; Charles the Bald caused them to be translated by Scotus, who long resided at his court. In this way something of the Alexandrian philosophy became known in the West. The Pope quarrelled with Charles, and complained to him of the translator, against whom he made the reproach that "he should have first sent the book to him in conformity with the general usage, and asked his approval." John Scotus afterwards lived in England as head of a school at Oxford, which had been founded by King Alfred.[16]

Scotus was also the author of some original works, which are not without depth and penetration, upon nature and its various orders (*De naturæ*

divisione), &c. Dr. Hjort, of Copenhagen, published an epitome of the writings of Scotus Erigena, in 1823. Scotus Erigena sets to work philosophically, expressing himself in the manner of the Neo-Platonists, and not freely, and as from himself. Thus in the method of expression adopted by Plato, and also by Aristotle, we are rejoiced to find a new conception, and on bringing it to the test of philosophy, to find it both correct and profound; but here everything is ready to hand, cut and dry. Yet, with Scotus, theology is not yet built on exegesis, and on the authority of the Church; the Church in many cases rejected his writings. Thus Scotus is reproached by a Lyons church council in these words: "There have come to us the writings of a boastful, chattering man, who disputes about divine providence and predestination, in human fashion, or, as he himself boasts, with philosophic arguments, and without relying on the holy scriptures and bringing forward the authority of the Fathers. And he dares to defend this on its own merit, and to establish it on its own laws, without submitting himself to the holy scriptures and the authority of the Fathers."[17] Scotus Erigena hence even said: "The true Philosophy is the true Religion, and the true Religion is the true Philosophy."[18] The separation came later on. Scotus then made a beginning, but properly he does not belong to the scholastics.

B. General Historical Points of View.

ALL FURTHER SCHOLASTIC philosophy attaches itself more to the doctrines of the Christian Church; the ecclesiastical system which it thereby made its necessary basis, became early established through church councils, while the faith of the Evangelical Church already prevailed before the time of these councils from which the Catholic Church derives its support. The most important and most interesting thoughts which pertain to the scholastics, are, on the one hand, the strife between nominalism and realism; and, on the other, the proof of the existence of God — quite a new manifestation.

1. The Building Up of Dogmas on Metaphysical Grounds.

The efforts of the scholastics were further directed, firstly, to the building up of the dogmas of the Christian Church on metaphysical bases. After this, the collected doctrines of the Church were systematically treated. Then the scholastics had branches or modifications of these dogmas, which were not determined by the doctrinal system. Those grounds themselves, and then these further and special points of view, were objects handed over for free discussion. Neo-Platonic philosophy was what lay before the theologians first of all; the manner of this school is recognized in the older and purer scholastics. Anselm and Abelard are the more distinguished of those who follow later.

a. Anselm.

Amongst those who wished to give additional proof of the doctrines of the Church through thought, is Anselm, a man of great distinction and high repute. He was born at Aosta, in Piedmont, about 1034; in 1060 he became a monk at Bec, and in 1093 was raised to the rank of Archbishop of Canterbury; in 1109 he died.[19] He sought to consider and prove philosophically the doctrines of the Church, and it has even been said of him that he laid the basis for scholastic philosophy.

He speaks as follows of the relation of faith to thought: "Our faith must be defended by reason against the godless, and not against those who glory in the name of Christian; for of these we may rightly demand that they should hold firm to the obligations which they came under in baptism. Those others must be shown through reason how irrationally they strive against us. The Christian must go on through faith to reason, and not come from reason to faith; but if he cannot attain to comprehension, he must still less depart from faith. For if he is able to press on to knowledge, he rejoices therein; when he is unable so to do, he humbly adores."[20] He makes a noteworthy remark, which contains his whole philosophy, in his work *Cur Deus homo* (I. 2), which is rich in speculative thought: "It appears to me great negligence if we are firm in the faith, and do not seek also to comprehend what we believe." Now this is declared to be arrogance; immediate knowledge, faith, is held to be higher than knowledge. But Anselm and the scholastics maintained the opposite view.

Anselm may be regarded from this point of view as quite specially the founder of scholastic theology. For the thought of proving through a simple chain of reasoning what was believed — that God exists — left him no rest day and night, and tortured him for long. At first he believed his desire to prove the divine truths through reason to be a temptation of the devil, and he was in great anxiety and distress on that account; finally, however, success came to him by the grace of God in his *Proslogium*.[21] This is the so-

called ontological proof of the existence of God which he set forth, and which made him specially famous. This proof was included among the various proofs up to the time of Kant, and — by some who have not yet reached the Kantian standpoint — it is so included even to the present day. It is different from what we find and read of amongst the ancients. For it was said that God is absolute thought as objective; for because things in the world are contingent, they are not the truth in and for itself — but this is found in the infinite. The scholastics also knew well from the Aristotelian philosophy the metaphysical proposition that potentiality is nothing by itself, but is clearly one with actuality. Later, on the other hand, the opposition between thought itself and Being began to appear with Anselm. It is noteworthy that only now for the first time through the Middle Ages and in Christianity, the universal Notion and Being, as it is to ordinary conception, became established in this pure abstraction as these infinite extremes; and thus the highest law has come to consciousness. But we reach our profoundest depths in bringing the highest opposition into consciousness. Only no advance was made beyond the division as such, although Anselm also tried to find the connection between the sides. But while hitherto God appeared as the absolute existent, and the universal was attributed to Him as predicate, an opposite order begins with Anselm — Being becomes predicate, and the absolute Idea is first of all established as the subject, but the subject of thought. Thus if the existence of God is once abandoned as the first hypothesis, and established as a result of thought, self-consciousness is on the way to turn back within itself. Then we have the question coming in, Does God exist? while on the other side the question of most importance was, What is God?

The ontological proof, which is the first properly metaphysical proof of the existence of God, consequently came to mean that God as the Idea of existence which unites all reality in itself, also has the reality of existence

within Himself; this proof thus follows from the Notion of God, that He is the universal essence of all essence. The drift of this reasoning is, according to Anselm (Proslogium, c. 2), as follows: "It is one thing to say that a thing is in the understanding, and quite another to perceive that it exists. Even an ignorant person (*insipiens*) will thus be quite convinced that in thought there is something beyond which nothing greater can be thought; for when he hears this he understands it, and everything that is understood is in the understanding. But that beyond which nothing greater can be thought cannot certainly be in the understanding alone. For if it is accepted as in thought alone, we may go on farther to accept it as existent; that, however, is something greater" than what is merely thought. "Thus were that beyond which nothing greater can be thought merely in the understanding, that beyond which nothing greater can be thought would be something beyond which something greater can be thought. But that is truly impossible; there thus without doubt exists both in the understanding and in reality something beyond which nothing greater can be thought." The highest conception cannot be in the understanding alone; it is essential that it should exist. Thus it is made clear that Being is in a superficial way subsumed under the universal of reality, that to this extent Being does not enter into opposition with the Notion. That is quite right; only the transition is not demonstrated — that the subjective understanding abrogates itself. This, however, is just the question which gives the whole interest to the matter. When reality or completion is expressed in such a way that it is not yet posited as existent, it is something thought, and rather opposed to Being than that this is subsumed under it.

This mode of arguing held good until the time of Kant; and we see in it the endeavour to apprehend the doctrine of the Church through reason. This opposition between Being and thought is the starting point in philosophy, the absolute that contains the two opposites within itself — a conception,

according to Spinoza, which involves its existence likewise. Of Anselm it is however to be remarked that the formal logical mode of the understanding, the process of scholastic reasoning is to be found in him, the content indeed is right, but the form faulty. For in the first place the expression "the thought of a Highest" is assumed as the *prius*. Secondly, there are two sorts of objects of thought — one that is and another that is not; the object that is only thought and does not exist, is as imperfect as that which only is without being thought. The third point is that what is highest must likewise exist. But what is highest, the standard to which all else must conform, must be no mere hypothesis, as we find it represented in the conception of a highest acme of perfection, as a content which is thought and likewise *is*. This very content, the unity of Being and thought, is thus indeed the true content; but because Anselm has it before him only in the form of the understanding, the opposites are identical and conformable to unity in a third determination only — the Highest — which, in as far as it is regulative, is outside of them. In this it is involved that we should first of all have subjective thought, and then distinguished from that, Being. We allow that if we think a content (and it is apparently indifferent whether this is God or any other), it may be the case that this content does not exist. The assertion "Something that is thought does not exist" is now subsumed under the above standard and is not conformable to it. We grant that the truth is that which is not merely thought but which likewise is. But of this opposition nothing here is said. Undoubtedly God would be imperfect, if He were merely thought and did not also have the determination of Being. But in relation to God we must not take thought as merely subjective; thought here signifies the absolute, pure thought, and thus we must ascribe to Him the quality of Being. On the other hand if God were merely Being, if He were not conscious of Himself as self-consciousness, He would not be Spirit, a thought that thinks itself.

Kant, on the other hand, attacked and rejected Anselm's proof — which rejection the whole world afterwards followed up — on the ground of its being an assumption that the unity of Being and thought is the highest perfection. What Kant thus demonstrates in the present day — that Being is different from thought and that Being is not by any means posited with thought — was a criticism offered even in that time by a monk named Gaunilo. He combated this proof of Anselm's in a *Liber pro insipiente* to which Anselm himself directed a reply in his *Liber apologeticus adversus insipientem*.[22] Thus Kant says (Kritik der reinen Vernunft, p. 464 of the sixth edition): If we think a hundred dollars, this conception does not involve existence. That is certainly true: what is only a conception does not exist, but it is likewise not a true content, for what does not exist, is merely an untrue conception. Of such we do not however here speak, but of pure thought; it is nothing new to say they are different — Anselm knew this just as well as we do. God is the infinite, just as body and soul, Being and thought are eternally united; this is the speculative, true definition of God. To the proof which Kant criticizes in a manner which it is the fashion to follow now-a-days, there is thus lacking only the perception of the unity of thought and of existence in the infinite; and this alone must form the commencement.

Other proofs such, for example, as the cosmological, which argues from the contingency of the world to an absolute existence, have thereby not reached the idea of absolute essence as spirit, and are without consciousness of the fact that it is an object of thought. The old physico-theological proof, which even Socrates possessed, from beauty, order, organic ends, indeed implies an understanding, a richer thought of absolute existence, and not alone an indeterminate Being, but in this proof it likewise remains unknown that God is the Idea. And then what sort of an understanding is God? A different and immediate one; then this spirit is independent. Further,

disorder likewise exists, and thus there must be something else conceived of than this apparent order of nature only. But from asking about the existence of God, from making his objective mode a predicate and thus knowing that God is Idea, to pass to making the absolute existence I = I, thinking self-consciousness, not as predicate but in such a way that each thinking I is the moment of this self-consciousness — is still a long stride. Here, where we see this form first emerge, absolute existence is clearly to be taken as the Beyond of finite consciousness; this is to itself the null and void, and it has not yet grasped its sense of self. Its thoughts regarding things are manifold, and the mere fact of being a thing is to it likewise just such a predicate as the rest; but it is thereby not yet turned back within itself, it knows of existence, but not of itself.

In this, says Tennemann (Vol. VIII. Sec. I. p. 121), "Anselm has laid the first formal ground of scholastic theology;" but even before this the same was present, only to a more limited extent, and merely for individual dogmas — as is also the case with Anselm. His writings bear witness of great penetration and mental ability; and he gave rise to the philosophy of the scholastics, inasmuch as he united theology to philosophy. The theology of the Middle Ages thus stands much higher than that of modern times; never have Catholics been such barbarians as to say that there should not be knowledge of the eternal truth, and that it should not be philosophically comprehended. This is one point which has to be specially noted in Anselm, the other is that he apprehended in its unity that highest opposition between thought and Being spoken of above.

b. Abelard.

With Anselm Peter Abelard is associated, both being mainly concerned in the introduction of philosophy into theology. Abelard lived about 1100 — from 1079 to 1142 — and is famed for his learning, but still more famed in

the world of sentiment and passion for his love to Heloise and his after fate.[23] After the days of Anselm he attained to great repute, and he followed him in his treatment of the doctrines of the Church, more especially seeking to give a philosophic proof of the Trinity. He taught at Paris. Paris about this time was to the theologians what Bologna was to the jurists, the central point of the sciences; it was at that time the seat of philosophizing theology. Abelard often delivered his lectures there before a thousand listeners. Theological science and philosophizing regarding it, was in France (as was jurisprudence in Italy) a matter of great importance, which, as most significant in the development of France, has hitherto been too much neglected. The conception prevailed that philosophy and religion were one and the same; which they absolutely speaking are. But the distinction was soon reached, "that much may be true in philosophy and false in theology:" this the Church denied. Tennemann (Vol. VIII. Sec. II. pp. 460, 461) quotes as follows from a rescript of the Bishop Stephen: "They say that this is true according to philosophy, and not according to the Catholic faith, just as if there were two contradictory truths, and as if in the doctrines of the accursed heathen a truth contradictory to the truth of the holy scriptures could be present." While then undoubtedly, through the separation of the four faculties in the University of Paris which came about in 1270, philosophy became separated from theology, it was yet forbidden to it to subject theological beliefs and dogmas to disputation.[24]

2. Methodical Representation of the Doctrinal System of the Church.

We now go on to the more definite form which the scholastic theology reached; for in a second development of scholastic philosophy the main endeavour became to make the teaching of the Christian Church methodical, while still keeping its connection with all previous metaphysical arguments. These and their counter-arguments were placed

side by side in stating every dogma, so that theology became represented in a scientific system, while before this the ecclesiastical teaching in the general education of the clergy was limited to the propounding of successive dogmas, and the writing down of passages from Augustine and other Fathers bearing on each proposition.

a. Peter Lombard.

Peter of Novara in Lombardy was the first of those who brought this to pass; he dates from the middle of the twelfth century, and was the originator of this method. He died in the year 1164. Petrus Lombardus set forth a whole system of scholastic theology which remained for several centuries the basis of the doctrine of the Church. He composed to that end his *Quatuor libros sententiarum*, and hence he likewise received the name *Magister sententiarum*. For in those times every learned schoolman had some predicate such as *Doctor acutus*, *invincibilis*, *sententiosus*, *angelicus*, &c. Others also availed themselves of the same title for their works; thus Robert Pulleyn wrote *Sententiarum libros octo*.[25]

Lombard collected the principal points in church doctrines from councils and Fathers, and then added subtle questions respecting particular items; with these the schools occupied themselves, and they became a subject of disputation. He himself, indeed, answered these questions, but he caused counter-arguments to follow, and his answer often left the whole matter problematical, so that the questions were not properly decided. The arguments are thus enumerated on either side; even the Fathers contradicted themselves, and numerous passages from them were quoted by both the opposed sides in support of their respective views. In this way *theses* arose, then *quæstiones*, in reply to these *argumenta*, then again *positiones*, and finally *dubia*; according as men chose to take the words in this sense or that,

and followed this or that authority. Yet a certain degree of method began to enter in.

Speaking generally, this middle of the twelfth century forms the epoch in which scholasticism became more universal as a learned theology. The book of Lombard was all through the Middle Ages commentated by the *doctores theologicæ dogmaticæ*, who were now held to be the recognized guardians of ecclesiastical doctrine, while the clergy had charge of the soul. Those doctors had great authority, they held synods, criticized and condemned this or that doctrine and book as heretical, &c., in synods or as the Sorbonne, a society of such doctors in the University of Paris. They took the place of assemblages of the Church, and were something like the Fathers in reference to the Christian doctrine. In particular they rejected the writings of the mystics like Amalrich and his disciple David of Dinant, who, resembling Proclus in their point of view, went back to unity. Amalrich, who was attacked as a heretic in 1204, for instance said, "God is all, God and the Creature are not different, in God all things are, God is the one universal substance." David asserted, "God is the first matter and everything is one in matter, and God is just this unity." He divided everything into three classes, bodies, souls, eternal immaterial substances or spirits. "The indivisible principle of souls is the νοῦς, and that of spirits is God. These three principles are identical and hence all things in essence are one." His books were burned.[26]

b. Thomas Aquinas.

The other individual who was equally famous with Peter Lombard, was Thomas Aquinas, born in 1224 of the noble race Aquino, in his paternal castle Roccasicca, in the province of Naples. He entered the Order of Dominicans, and died in 1274 on a journey to a church council at Lyons. He

possessed a very extensive knowledge of theology, and also of Aristotle; he was likewise called *Doctor angelicus* and *communis*, a second Augustine. Thomas Aquinas was a disciple of Albertus Magnus, he wrote commentaries on Aristotle and on Petrus Lombardus; and he also himself composed a *summa theologiæ* (that is, a system) which with his other writings obtained for him the greatest honour, and which became one of the principal text-books in scholastic theology.[27] In this book there are found, indeed, logical formalities — not, however, dialectical subtleties, but fundamental metaphysical thoughts regarding the whole range of theology and philosophy.

Thomas Aquinas likewise added questions, answers and doubts, and he gave the point on which the solution depended. The main business of scholastic theology consisted in working out the *summa* of Thomas. The principal point was to make theology philosophic and more widely systematic; Peter Lombard and Thomas Aquinas are best known in respect of this endeavour, and for long their works formed the basis of all further learned elaborations of doctrine. With Thomas, Aristotelian forms constitute the basis — that of substance (*forma substantialis*) is, for instance, analogous to the entelechy (ἐνέργεια) of Aristotle. He said of the doctrine of knowledge, that material things consist of form and matter; the soul has the substantial form of the stone in itself.[28]

c. John Duns Scotus.

In respect of the formal development of philosophic theology a third individual is famous, namely, Duns Scotus, *Doctor subtilis*, a Franciscan, who was born at Dunston in the county of Northumberland, and who little by little obtained thirty thousand disciples. In the year 1304 he came to Paris, and in 1308 to Cologne, as a doctor in the university newly instituted

there. He was received with great rejoicings, but he died there of apoplexy soon after his arrival, and is said to have been buried alive. He is supposed to have been only 34, according to others 43, and according to others again 63 years old, for the year of his birth is not known.[29] He wrote commentaries on the *Magister sententiarum*, which procured for him the fame of a very keen thinker, following the order of beginning with the proof of the necessity of a supernatural revelation as against the mere light of reason.[30] On account of his power of penetration he has been likewise called the *Deus inter philosophos*. He was accorded the most excessive praise. It was said of him: “He developed philosophy to such an extent that he himself might have been its discoverer if it had not already been discovered; he *knew* the mysteries of the faith so well that he can scarcely be said to have *believed* them; he knew the secrets of providence as though he had penetrated them, and the qualities of angels as though he were himself an angel; he wrote so much in a few years that scarcely one man could read it all, and hardly any were able to understand it.”[31]

According to all testimony it appears that Scotus helped the scholastic method of disputation to reach its height, finding the material for the same in arguments and counter-arguments arranged in syllogisms; his manner was to add to each *sententia* a long succession of *distinctiones*, *quæstiones*, *problemata*, *solutiones*, *argumenta pro et contra*. Because he also refuted his arguments in a similar series, everything fell once more asunder; hence he was held to be the originator of the quodlibetan method. The *Quodlibeta* signified collections of miscellaneous dissertations on individual objects in the every-day manner of disputation, which speaks of everything, but without systematic order and without any consistent whole being worked out and set forth; others, on the other hand, wrote *summas*. The Latin of Scotus is exceedingly barbarous, but well suited for exact philosophic

expression; he invented an endless number of new propositions, terms and syntheses.

3. Acquaintanceship with Aristotelian Writings.

We must further remark a third development, which proceeded from the external historical circumstance that in the end of the twelfth and in the thirteenth century the Western theologians became more generally acquainted with the Aristotelian writings and their Greek and Arabian commentators, in Latin translations from the Arabic. These now became much used by them, and were made the subject of further commentaries and discussions. The veneration, admiration and respect which Aristotle received, now reached its height.

a. Alexander of Hales.

The familiar acquaintance with Aristotle and the Arabians became first evident in Alexander of Hales (died 1245), the *Doctor irrefragabilis*. The earlier stages by which this familiarity came about has been shown above (p. 35). Hitherto the acquaintance with Aristotle was very slight, and through many centuries it was limited, as we saw above (p. 37), more especially to his Logic, which had survived from the earliest times and was transmitted in the works of Boethius, Augustine and Cassiodorus. It was only when we came to Scotus Erigena that we found (p. 59) a knowledge of Greek, although it was quite unusual in his day. In Spain, under the Arabians, the sciences flourished greatly. In particular the university of Cordova in Andalusia was a centre-point of learning; many from the lands of the West journeyed thither, just as even the Pope Sylvester II., so well known in his earlier days as Gerbert, escaped as a monk to Spain for the purpose of studying with the Arabs.[32] The sciences of medicine and alchemy were diligently pursued. Christian doctors there studied medicine

under the Jewish-Arabian teachers. It was principally the Aristotelian metaphysics and physics which were then known, and from these abstracts (*summæ*) were constructed. The logic and metaphysics of Aristotle were spun out with extreme fineness into endless distinctions, and brought into genuine syllogistic forms of the understanding, which constituted for the most part the principle for the treatment of the subject dealt with. In this way dialectic subtlety was much increased, while the properly speculative side in Aristotle remained for the spirit of externality, and consequently also of irrationality, in the background.

The Hohenstaufen emperor Frederick II. then sent for Aristotelian books from Constantinople and had them translated into Latin. At first, indeed, on the first appearance of the Aristotelian writings, the Church made difficulties; the reading of his metaphysics and physics and the abstracts prepared therefrom, as also the exposition of the same, was forbidden by a church synod held at Paris 1209. Likewise in 1215 the cardinal Robert Corceo came to Paris and there held a visitation of the university, on which occasion he ordained that regular lectures on the dialectical writings of Aristotle should be held while he forbade the reading of and lecturing on the metaphysics and natural philosophy of Aristotle, and the abstracts prepared from them; he also condemned the doctrines of the heretics David of Dinant and Amalrich and likewise the Spaniard Mauritius. Pope Gregory, in a bull issued to the University of Paris in 1231, without mentioning metaphysics, forbade the books of the Physics to be read until they had been examined and purified from all suspicion of error. But later on, in 1366, it was on the other hand ordained by two cardinals that no one could be made a *magister* unless he had studied the prescribed books of Aristotle — amongst which were the Metaphysics and some of the Physics — and had proved himself capable of explaining them.[33] It was only much later on, however, when Greek literature in general had again become widely

diffused, that men became better acquainted with the Greek text of the Aristotelian writings.

b. Albertus Magnus.

Amongst those who distinguished themselves through their commentaries on Aristotle's writings, we must specially mention Albertus Magnus, the most celebrated German schoolman, of the noble race of Bollstadt. Magnus either was his family name, or it was given him on account of his fame. He was born in 1193 or 1205 at Lauingen on the Danube in Swabia, and began by studying at Padua, where his study is still shown to travellers. In the year 1221 he became a Dominican friar, and afterwards lived at Cologne as Provincial of his Order in Germany: in 1280 he died. It is said of him that in his youth he showed himself very dull and stupid, until, according to a legend, the Virgin Mary appeared to him in company with three other beautiful women, incited him to the study of Philosophy, liberated him from his dulness of understanding, and promised him that he should enlighten the Church, and, in spite of his science, should still die in the faith. What happened was in accordance with this prophecy, for five years before his death he forgot all his philosophy as quickly as he learned it, and then actually died in the dulness and orthodoxy of his earlier years. Hence there is current regarding him an old saying: "Albert changed quickly from an ass into a philosopher, and from a philosopher into an ass." His learning was generally understood to consist largely of magic. For although natural objects have nothing to do with scholasticism proper, which was really perfectly blind to nature, he occupied himself much therewith; and amongst other devices he manufactured a talking machine which alarmed his pupil Thomas of Aquino, who even aimed a blow at it, thinking he saw therein a work of the devil. Likewise the fact that he received and entertained William of Holland[34] in the middle of winter in a garden full of blossom, is

counted as magic.[35] While as for us — we find the winter-garden in Faust quite natural.

Albert wrote a great deal, and twenty-one folios remain to us of his writings. He wrote on Dionysius the Areopagite, commentated the *Magister sententiarum*, was specially conversant with the Arabians and the Rabbis, as he was also well acquainted with the works of Aristotle, although he himself understood neither Greek nor Arabic. He likewise wrote on the Physics of Aristotle. There is found in him a remarkable instance of deficient knowledge of the history of Philosophy. He derived the name Epicurean (Opera, T.V. pp. 530, 531) from the fact that they idled away their time [auf der faulen Haut lagen] (ἐπὶ *cutem*) or else from *cura* because they concerned themselves with many useless things (*supercurantes*). He represents the Stoics as being something like our choir-boys; he says that they were people who made songs (*facientes cantilenas*), and roamed about in porticoes. For, as he here remarks in a very learned way, the first philosophers clothed their philosophy in verses, and then sang them in halls and porches, and hence they are called standers in the porch (*Stoici*). Gassendi relates (*Vita Epicuri*, I. c. 11, p. 51) that Albertus Magnus mentioned as the first Epicureans, Hesiodus, Athalius or Achalius (of whom we know nothing), Cæcina, or, as others call him, Tetinnus, a friend of Cicero, and Isaacus, the Jewish philosopher. How that is arrived at we do not know at all. Of the Stoics Albertus, on the contrary, mentions Speusippus, Plato, Socrates and Pythagoras. These anecdotes give us a picture of the condition of culture in these times.

4. Opposition Between Realism and Nominalism.

In the fourth place we must mention an important matter, to which much attention was devoted in the Middle Ages, namely that particular philosophic question which formed the subject of controversy between the

Realists and the Nominalists, and the discussion of which was continued through very nearly the whole of the Scholastic period. Speaking generally, this controversy is concerned with the metaphysical opposition between the universal and the individual; it occupies the attention of Scholastic philosophy for several centuries, and reflects great credit upon it. A distinction is drawn between the earlier and later Nominalists and Realists, but otherwise their history is very obscure; and we know more of the theological aspect of the subject than of this.

a. Roscelinus.

The beginning of the controversy dates back to the eleventh century, Roscelinus being the earliest Nominalist. The famous Abelard, although he professes to be an opponent of Roscelinus, is himself nothing more or less than a Nominalist. Roscelinus wrote also against the doctrine of the Trinity, and was pronounced guilty of heresy in 1092 at an ecclesiastical council which met at Soissons. His influence was, however, but small.[36]

The matter in question is the universal as such (*universale*), or the genus, the essence of things, what in Plato was called the Idea — for instance, Being, humanity, the animal. The followers of Plato asserted that these universals exist; their existence was individualized, and thus 'tableness' was said to be also a real existence (*supra*, Vol. II. p. 29). We make representations of a thing to ourselves, and say "it is blue;" this is a universal. The question now is whether such universals are something real in and for themselves, apart from the thinking subject, and independent of the individual existing thing, so that they exist in the individual things independently of the individuality of the thing and of each other; or whether the universal is only nominal, only in the subjective representation, a thing of thought. Those who maintained that the universals had a real existence apart from the thinking subject and distinct from the individual thing, and

that the Idea alone constitutes the essence of things, were termed Realists — a use of the term in quite an opposite sense to that which passes current now. I mean that this expression has for us the signification that things as they are in their immediacy have an actual existence; and to this idealism is opposed, that being a name which was given later to the philosophy which ascribes reality to ideas alone, and asserts that things as they appear in their individuality have no truth. The realism of the Scholastics in the same way maintained that the Universal has an independent, absolute existence, for Ideas are not liable to destruction, like natural things, therefore they are immutable and the only true existence. In opposition to this, the others, the Nominalists or Formalists, asserted that if generals or universals are formed, these are only names, matters of form, representations which we make to ourselves, a subjective generalization, a product of the thinking mind; the individual alone is the real.

This is then the matter in question; it is of great interest, and is founded upon a much higher opposition than any the ancients knew of. Roscelinus made universal conceptions arise only from the necessities of language. He maintained that ideas or universals, like Being, life, reason, are in themselves nothing but mere abstract notions or generic names, which, as such, have in and for themselves no universal reality of their own: that which has Being and life is found in the individual alone. Against these assertions arguments are brought forward by which one can see that the manner in which the Christian world was taken as basis, often became in the highest degree ridiculous. For instance, Abelard reproaches Roscelinus for having asserted that no thing has parts, that only the words which denote the things are divisible. Abelard proved that according to Roscelinus, Christ did not eat a real part of the broiled fish, but only a part — I do not know which — of the word "broiled fish," since according to him there were no parts — which interpretation would be preposterous and highly

blasphemous.[37] Our way of reasoning from "healthy human understanding," is not much better.

b. Walter of Mortagne.

Walter of Mortagne (d. 1174) aimed at the union of the particular and the universal, saying that the universal must be individual, that universals must be united with individuals in accordance with their essence.[38] In later times the two rival factions were known to fame as Thomists, from the Dominican Thomas Aquinas, and Scotists, from the Franciscan Johannes Duns Scotus. Nevertheless, the original question as to whether universal notions have reality, and, if so, to what extent they have it, underwent a great variety of modifications and gradations, just as the opposing parties received very various names. Nominalism, in its crude form, declared universal notions to be mere names, which have reality only in speech, and it ascribed reality to individuals alone; Realism followed the exactly opposite course of attributing reality only to universals, while it considered that what distinguished individual things was an accident only or a pure difference. Neither of these two theories was correct in the manner of passing from the universal to the particular. There were some, however, among the Schoolmen who grasped the true conception that individuation, the limitation of the universal, and indeed of what is most universal, Being and entity, is a negation. Others said that the limit is itself something positive, but that it is not one with the universal by union with it, for it rather stands in a metaphysical connection with it, that is, in a connection such as that which binds thought with thought. This implies that the individual is only a clearer expression of what is already contained in the general conception; so that these conceptions, in spite of their being divided into parts and differentiated, still remain simple; Being or entity, moreover, really is a Notion.[39]

Thomas, who was a Realist, declared the universal Idea to be indeterminate, and placed individuation in determinate matter (*materia signata*), *i.e.* matter in its dimensions or determinations. According to him, the original principle is the universal Idea; the form, as *actus purus*, may, as with Aristotle, exist on its own account; the identity of matter and form, the forms of matter, as such, are further removed from the original principle, —while thinking substances are mere forms.[40] But for Scotus the universal is rather the individual One, the one he thinks may appear also in the other; he maintained therefore the principle of individuation, and the formal character of the universal. In his view indeterminate matter becomes individual through an inward positive addition; the substantial forms of things are their real essence. Occam thus represents the views of Scotus: "In the thing that exists outside of the soul the same Nature exists *realiter* with the difference limiting (*contrahente*) it to a determinate individual, being only formally distinguished, and in itself neither universal nor individual, but incompletely universal in the thing, and completely universal in the understanding."[41] Scotus racked his brains much over this subject. To universals the Formalists allowed only an ideal reality in the divine and human intellect beholding them.[42] We thus see how closely connected with this is the thought which we first meet with in the Scholastics, namely the seeking and giving of so-called proofs of God's existence (*supra*, pp. 62-67).

c. William Occam.

The opposition between Idealists and Realists appeared at an early stage, it is true, but it was not until later, after the time of Abelard, that it became the order of the day, and was invested with general interest. This was brought about chiefly by the Franciscan William Occam, of the village of Occam in the county of Surrey in England, who was surnamed *Doctor invincibilis*,

and flourished in the beginning of the fourteenth century: the year of his birth is unknown. He is greatly celebrated for his skill in handling the weapons of logic; he is keen in discrimination and fertile in devising arguments and counter-arguments. Occam was a leading champion of Nominalism, which up to this time had found only here and there a defender, like Roscelinus and Abelard; his numerous followers received the name of Occamists and were Franciscans, while the Dominicans retained the name of Thomists. The conflict between Nominalists and Realists raged with a burning vehemence, and was carried to the greatest extremes; a pulpit is still shown which was separated by a wooden partition from the platform of the opponent, in order that the disputants might not come to blows. Henceforth theology was taught under two forms (*theologia scholastica secundum utramque partem*). Owing to the civil wars in France, politics also began gradually to affect the relationship between the orders, and this lent increased importance to the conflict into which jealousy had plunged the rival factions. In 1322, at a convention of his order, and also on other occasions, Occam and his order defended to the utmost of their power the claims of the different princes, such as the King of France and the Emperor of Germany, Louis of Bavaria, against the pretensions of the Pope. Among the words of William to the Emperor were these, “Do thou defend me with the sword, and I will defend thee with the pen.” Interdicts of the Paris University and Papal bulls were issued against Occam. The Paris University forbade his doctrines to be taught or his works quoted. A special prohibition was issued in 1340: “No teacher shall venture to assert plainly, or in so many words, that some familiar maxim of the author on whom he is lecturing is false, but shall either assent to it, or distinguish the true and the false significance; otherwise the dangerous result is to be apprehended that the truths of the Bible might be in like manner rejected. No teacher shall

assert that a maxim cannot be thus explained or further defined." Occam was excommunicated in 1328, and died at Munich in 1343.[43]

Occam asks in one of his writings (*in libr. I. Sentent. Dist. II. Quæst. 4*), "Whether what is immediately and proximately denoted by the universal and by the generic name is a real thing outside of the soul, something intrinsic and essential in the things to which it is common and which are called by its name, and yet in reality distinguished from them." This definition of the Realists is given more in detail by Occam as follows: "As to this question, one opinion is that each generic designation or universal is a thing really existing outside of the soul in each and every individual, and that the Being (*essentia*) of each individual is really distinguished from each individual" (*i.e.* from its individuality), "and from each universal. Thus man, the universal, is a true thing outside of the soul, which exists in reality in each human being, but is distinguished from each human being, from Universal living nature, and from the universal substance, and in this way from all species and genera, those that are subordinate as well as those that are not subordinate." The universal, the common designation of all the individuals, is therefore, according to this, not identical with the Self, the ultimate point of subjectivity. "As many universal predicables as there are of any individual thing" — *e.g.* humanity, reason, Being, life, quality, &c.— "so many really different things there are in nature, each of which is really distinct from the other and from that individual, and all these things are in no wise multiplied in themselves, however much the separate predicables are multiplied, which are in every individual of the same kind." That is the most uncompromising way of stating the independence and isolation of every universal quality in a thing. Occam refutes this, saying: "Nothing which is one in number can, without being changed or multiplied, be present in several subjects or individuals. Science invariably restricts itself to propositions regarding the known; it is, therefore, a matter of no moment

whether the terms of the propositions are known things outside of the soul, or only in the soul; and therefore it is not necessary for the sake of science to assume universal things, really distinct from individual things.”

Occam proceeds to state other opinions opposed to that first given; he does not exactly give his own decision, yet in this same passage (Quæst. 8) he, in the main, argues in favour of the opinion “that the universal is not something real that has explicit subjectivity (*esse subjectivum*) neither in the soul nor in the thing. It is something conceived, which, however, has objective reality (*esse objectivum*) in the soul, while the external thing has this objective reality as an explicitly existent subject (*in esse subjectivo*). This comes to pass in the following manner. The understanding, which perceives a thing outside the soul, forms the mental image of a similar thing, so that, if it had productive power, it would, like an artist, exhibit it in an absolutely existing subject, as numerically an individual distinct from any preceding. Should anyone be displeased by this manner of speaking of the mental image as being *formed*, it may be said that the mental image and every universal conception is a quality existing subjectively in the mind, which by its nature is the sign of a thing outside of the soul, just as the spoken word is a sign of the thing, arbitrarily instituted for marking out that thing.” Tennemann says (Vol. VIII. Section II. p. 864): “One result of this theory was that the principle of individuation, which had occupied to such an extent the attention of the Scholastics, was cast aside as utterly unnecessary.” Thus the main question with the Scholastics concerns the definition of the universal, and this was in itself highly important and significant for the culture of more modern times. The universal is the One, but not abstract; it is conceived or thought of as comprehending all things in itself. With Aristotle the universal was, in a judgment, the predicate of the subject in question; in a syllogism it was the *terminus major*. With Plotinus, and especially with Proclus, the One is still incommunicable, and is known

only by its subordinate forms. But because the Christian religion is a revelation, God is no longer therein the unapproachable, incommunicable, a hidden mystery: for the various stages of the progression from Him are verily His manifestation, and the Trinity is thus the revealed. In this way the triads and the One are not distinguished, but these three Persons in the Godhead are themselves God and One, *i.e.* One as it is for another, as in itself relative. The Father, the God of Israel, is this One; the moment of the Son and of the Spirit is the Most High in spiritual and bodily presence, the former in the Church, the latter in Nature. With the Neo-Platonists the universal is, on the contrary, only the first condition of things which then merely opens out and develops; with Plato and Aristotle it is rather the Whole, the All, the All in One.

d. Buridan.

Buridan, a Nominalist, inclines to the view of the Determinists that the will is determined by circumstances. Against him is cited the case of the ass which, being placed between two equal bundles of hay, perforce perished from hunger.

Louis XI., in 1473, confiscated the books of the Nominalists and interdicted the teaching of their doctrines, but in the year 1481 this interdict was removed. In the theological and philosophical faculty Aristotle is said to have been interpreted and studied, as were also his commentators, Averroës, Albertus Magnus, and Thomas Aquinas.[44]

5. Formal Dialectic.

The study of dialectics was carried to a very great height, but it was quite formal in character; this constitutes the fifth point for consideration. With this is closely connected the interminable finding out of *termini technici*. This formal dialectic was very ingenious in devising objects, problems and

questions, destitute of all religious and philosophic interest, on which to practise its method of procedure. The last remark that we have, however, in this connection to make regarding the Scholastics is this, that it was not only into the ecclesiastical system that they introduced all possible formal relations of the understanding, but that also objects intelligible in themselves — the intellectual conceptions and religious ideas — they represented as immediately and sensuously real, as brought down into the externality of altogether sensuous relations, and in these relations subjected to systematic investigation. Originally, it is true, the basis was spiritual, but the externality in which it was at once comprehended, made of the spiritual something perfectly unspiritual. It may therefore be said that, on the one hand, the Scholastics showed great profundity in their treatment of Church dogma; and, on the other hand, that they secularized it by placing it in quite inappropriate external relations; thus here we have the worst kind of secularity. For the dogma of the Church explicitly contains, in the historical form of the Christian religion, a number of ordinary conceptions determined in an external way, which are connected with the spiritual, it is true, but trench upon sensuous relationships. If a network of such relationships is then contrived, there arises a host of oppositions, contrasts, contradictions, which have not the very slightest interest for us. It is this aspect of the matter that the Scholastics have taken up and handled with finite dialectic; and it is on this account that the Scholastics in later times were so much ridiculed. Of this I have some examples to give.

a. Julian, Archbishop of Toledo.

Julian, Archbishop of Toledo, sought, with as great earnestness as if the salvation of the human race depended on it, to answer questions which contain an absurd assumption. In doing so he no less gives himself up to petty triflings than do the philologists when they institute investigations

regarding Greek accents, metres, and verse-divisions. For instance, there arises a question of this kind as to the dead. It is a dogma of the Church, that man will rise again; now if to this it be added that he will be clothed with the body, we thereby enter the sensuous sphere. The following were inquiries which arose in connection with this question: "What will be the age of the dead when they rise? Will they rise as children, youths, grown men, or aged? In what form will they rise? What will be the constitution of their bodies? Will the fat be again fat, and the lean again lean? Will the distinction of sex continue in that future life? Will those who rise again recover all that they lost here in the way of nails and hair?"[45] Thus a special distinction was drawn between the actual dogma, which was indisputable, and the various aspects of the supersensuous world which are connected with that dogma. These were regarded, though often only for the time being, as detached from the doctrinal system of the Church. For the system was not so definitely formulated but that anything in it might have to be proved from the Fathers, until a council or a special synod decided the point. Disputes were also possible regarding the proofs which were given of the content of this system; and besides there was quite a large amount of matter which was open to discussion, and respecting which the Scholastics — with the exception, of course, of the noble men, renowned as *Doctores* and writers, — expressed themselves in finite syllogisms and forms, which degenerated into an utterly empty and formal craze for disputation. The Scholastic Philosophy is thus the direct opposite of the empirical science of the understanding, with which curiosity is largely mingled, and which, careless of the Notion, follows after facts alone.

b. Paschasius Radbertus.

About 840 another subject of discussion was raised, namely, the birth of Christ, whether it was natural or supernatural. This led to a protracted

controversy. Paschasius Radbertus wrote two volumes, *De partu beatæ virginis*; and many others wrote and argued on the same topic.[46] They went so far as even to speak of an accoucheur, and to discuss this subject; and many questions were raised, to which our sense of what is fitting forbids us even to turn our thoughts.

God's wisdom, omnipotence, foresight, and predetermination led in the same way to a host of contradictions in abstract, meaningless, local and trivial particulars, which concern not God. In the works of Petrus Lombardus, where the Trinity, the Creation, and the Fall are dealt with, as also angels and their orders and ranks, questions are found such as whether God's providence and predetermination would have been possible, had nothing been created; and where God was before the Creation. Thomas of Strasburg answered: *Tunc ubi nunc, in se, quoniam sibi sufficit ipse*.[47]

Lombardus goes on to ask "If God can know more than He knows?" as if potentiality and actuality still remained distinguished; "If God retains at all times all power that He has once possessed? Where the angels were after their creation? If the angels have always existed?" A multitude of other questions of this kind are raised regarding the angels. Then he asks: "At what age was Adam created? Why was Eve made from the rib, and not from some other part of the man? Why during sleep, and not when the man was awake? Why did the first human pair not have intercourse in Paradise? How the human race would have been propagated, if man had not sinned? If in Paradise children would have been born with limbs fully grown, and the complete use of their senses? Why it was the Son, and not the Father or the Holy Ghost, who became man?" To do this rests in the very Notion of the Son. "If God could not have also become incarnate in female form?"[48]

Additional examples of *quæstiones* of this kind are given by those who ridiculed such dialectic, for instance by Erasmus in his *Encomium moriæ*:

“Could there be several sonships (*filiationes*) in Christ? Is the proposition possible that God the Father hates the Son? Might God not have also taken the form of a woman, or have passed into the devil? Might He not also have appeared in the form of an ass or of a pumpkin? In what manner would the pumpkin have preached and wrought miracles, and how would it have been crucified?”[49] Thus were intellectual determinations combined and distinguished in a manner altogether without sense or thought. The main point is that the Scholastics were like barbarians in their way of handling divine things and bringing them into sensuous determinations and relations. They thus introduced a completely sensuous rigidity and these altogether external and senseless forms into the purely spiritual, thus bringing it to a lower and unspiritual level; Hans Sachs similarly made a Nürnberg version of sacred history [die göttliche Geschichte vernürnbergert]. In such representations as are given in the Bible of the wrath of God, or of the history of God’s work of creation, it is said that God did this or that, naming some human and homely action. God is certainly not to be looked on as something alien and unapproachable; on the contrary, we are to come to Him with courage and with all our heart. But to bring Him into the province of thought, and strive in earnest after a knowledge of Him, is a very different matter. The reverse of this is to bring forward arguments *pro* and *contra*, for they decide nothing, and are of no use; they are no more than the assumptions which are only sensuous and finite determinations, and therefore infinite differences and distinctions. This barbarous use of the understanding is utterly irrational; it is like putting a golden necklace on a sow. The One is the Idea of the Christian religion, and it is also the philosophy of the great and noble Aristotle; neither of the two could have been more bedraggled and besmirched, to so low a pass had the Christians brought their spiritual Idea.

6. Mystics.

In the above sketch we have mentioned the principal heads which come under our consideration in studying Scholastic philosophy. With regard to this intrusion of distinctions of the understanding and sensuous relations into that which in and for itself and by virtue of its very nature is spiritual, absolute and infinite, it is to be remarked that to this craze for reducing everything to the finite, some noble spirits here and there opposed themselves. As such we must here, in the sixth place, make honourable mention of the many great Scholastics who have been named Mystics, for although they are to be distinguished from the real ecclesiastical Scholastics, they followed upon identical lines, and are closely connected with them. They took but little interest in these discussions and arguments, and maintained their purity in regard to Church doctrines and philosophic speculation. Some of them were pious and spiritual men, who carried on their philosophic studies upon the lines of the Neo-Platonic philosophy, as Scotus Erigena had done in earlier times. Among them genuine philosophy is to be found — termed also Mysticism; it tends to inwardness and bears a great resemblance to Spinozism. They also derived morality and the religious sentiment from actual feelings, and the meditations and maxims we have from them embody these views.

a. John Charlier.

John Charlier, more generally known as Von Jerson or Gerson, was born in 1363; he wrote a *theologia mystica*.[50]

b. Raymundus of Sabunde.

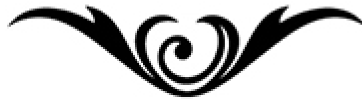
Very similar were the views expressed by Raymundus of Sabunde or Sabeyde, a Spaniard of the fifteenth century, and professor at Toulouse

about the year 1437. In his *theologia naturalis*, which he handled in a speculative spirit, he dealt with the Nature of things, and with the revelation of God in Nature and in the history of the God-man. He sought to prove to unbelievers the Being, the trinity, the incarnation, the life, and the revelation of God in Nature, and in the history of the God-man, basing his arguments on Reason. From the contemplation of Nature he rises to God; and in the same way he reaches morality from observation of man's inner nature.[51] This purer and simpler style must be set off against the other, if we are to do justice to the Scholastic theologians in their turn.

c. Roger Bacon.

Roger Bacon treated more especially of physics, but remained without influence. He invented gunpowder, mirrors, telescopes, and died in 1294.[52]

d. Raymundus Lullus.



Raymundus Lullus, the *Doctor illuminatus*, made himself famous chiefly by the art of thinking which he invented, which was called the *ars magna*. He was born at Majorca in 1234, and was one of those eccentric, unsettled natures whose activity finds vent in all directions. He had a strong inclination towards alchemy and great enthusiasm for the sciences in general, as well as a fiery, restless power of imagination. In his youth he led a reckless life, throwing himself headlong into a round of pleasures; then he retreated to a desert, and had there many visions of Jesus. At this time the impulse shaped itself in his ardent nature to dedicate his life to spreading the blessings of Christianity among the Mohammedans in Asia and Africa. In order to carry on this work of conversion he learned Arabic, travelled through Europe and Asia, sought for assistance from the Pope and all the crowned heads of Europe, without giving up, for all that, his interest in his 'Art.' He suffered persecution and passed through many hardships and

strange adventures, perils of death, imprisonments, cruelties. He lived long in Paris at the beginning of the fourteenth century, and was the author of well-nigh four hundred works. After a life of the utmost restlessness, he died in 1315, revered as a saint and martyr, his death being the result of cruel treatment which he had suffered in Africa.[53]

The chief object aimed at in this man's 'Art' was an enumeration and arrangement of the various concepts under which all objects fall, or of the pure categories according to which they can be determined, so that it may be possible in regard to every object to indicate with ease the conceptions applicable to it. Lullus is so systematic that he becomes at times mechanical. He constructed a diagram in circles, on which were marked triangles through which the circles pass. In these circles he arranged the various concepts, and strove to give a complete catalogue of them. Some of the circles were fixed, others movable, and they were six in number, two of them indicating the subjects, three the predicates, while the outermost circle represented possible questions. For each class he had nine qualities, to indicate which he chose nine letters, B C D E F G H I K. Thus in the first place he wrote round the diagram nine absolute predicates, goodness, greatness, duration, power, wisdom, volition, virtue, truth, splendour; then he wrote nine relative predicates, diversity, unanimity, opposition, beginning, middle, end, the qualities of being greater, equal, or less; in the third place he set down the questions Whether? What? Whence? Why? How great? Of what nature? When? Where? How and wherewith? the ninth of which contains two determinations; in the fourth place he put nine substances (*esse*), viz. God (*divinum*), angel (*angelicum*), heaven (*cæleste*), man (*humanum*), *imaginativum*, *sensitivum*, *vegetativum*, *elementativum*, *instrumentativum*; in the fifth place were nine accidents, *i.e.* natural relations, viz. quantity, quality, relation, activity, passivity, possession, position, time, place; and sixthly nine moral relations, the virtues, viz.

justice, prudence, courage, temperance, faith, hope, love, patience, piety; and the vices, viz. envy, wrath, inconstancy, covetousness, falsehood, gluttony, riotousness, pride, sluggishness (*acedia*). These circles had to be placed in a certain way, in order to give proper combinations. By turning them round according to certain rules, by which all substances received the absolute and relative predicates which fitted them, it was supposed that there would be obtained in every possible combination universal science, truth, and the knowledge of concrete objects in general.[54]

C. General Standpoint of the Scholastics.

After thus dealing with the subject in detail, we must pronounce judgment on the Scholastics, and give an estimate of them. Though the subjects which they investigated were lofty, and though there were noble, earnest and learned individuals in their ranks, yet this Scholasticism on the whole is a barbarous philosophy of the finite understanding, without real content, which awakens no true interest in us, and to which we cannot return. For although religion is its subject matter, thought here reached such an excessive point of subtlety that, as a form of the mere empty understanding, it does nothing but wander amongst baseless combinations of categories. Scholastic philosophy is this utter confusion of the barren understanding in the rugged North German nature. We see here two different worlds, a kingdom of life and a kingdom of death. The intellectual kingdom, which is outside and above, while in the popular conception, is thereby brought within the sphere of the mere understanding and the senses, even though by nature it is purely peculative; and this does not take place as in art, but, on the contrary, after the fashion of ordinary reality. As the relationship of Father and Son, to begin with, appealed to the senses, so the divine world was furnished for the imaginative faculty and for purposes of devotion (in a way unknown to the disciples of Plato) with angels, saints and martyrs, instead of with thoughts; — or the thoughts are nothing but a rubbishy metaphysic of the understanding. In the supersensuous world there was no reality of the thinking, universal, rational self-consciousness to be met with: in the immediate world of sensuous nature, on the other hand, there was no divinity, because nature was but the grave of God, in the same way that God was outside of nature. The existence of the Church, as the

government of Christ upon earth, is higher, it is true, than the external existence which stands in contrast to it; for religion must rule our temporal affairs, and through the subjection of worldly power the Church became a theocracy. But the divine kingdom, the dwelling-place of the dead, was to be reached only through the gate of death; yet the natural world was dead to an equal degree — all that lived in it was the vision of that other world, and hope — it had no present. It was of no avail to introduce mediators as a connecting link, the Virgin Mary, or the dead in a world beyond. The reconciliation was formal, not absolute; for it was nothing but the longing of man for a satisfaction to be found only in another world. What purpose does all this serve? It lies behind us as a thing of the past, and must continue useless to us on its own merits. There is no good, however, in calling the Middle Ages a barbarous period. It is a singular kind of barbarism, and is not simple and rude; for the absolute Idea and the highest culture have sunk into barbarism, and that through the agency of thought. Thus we have here, on the one hand, the most hideous form of barbarism and perversion, but, on the other hand, the never-failing source of a higher reconciliation.

If we seek an immediate contrast to scholastic philosophy and theology and their methods, we may say that it is to be found in the "healthy human understanding," in outward and inward experience, in the contemplation of nature, and in humanity. The character of Greek humanity, for instance, was that everything concrete, everything that possessed interest for mind, had its place in the human breast, and its root in the feelings and thoughts of man. Intelligent consciousness, cultured science, has in such content its real material — that in which it is and remains at home with itself; knowledge busies itself on all sides with that which concerns it, and remains true to itself, while both on its serious and its playful side it finds in this material, in Nature and its uniform laws, a standard and a guide by which to direct its course aright. Even should we go astray on ground like this, our errors keep

in view the fixed centre-point of the self-consciousness of the human mind, and as errors even they have a root therein, which as such forms the justification for them. It is only a one-sided withdrawal from the unity of this root with the altogether concrete ground-work and original, that is really faulty. What we see here, in contrast with the above, is the infinite truth, expressed as spirit, committed to a nation of barbarians who have not the self-consciousness of their spiritual humanity — they have a human breast, it is true, but not yet a human spirit. The absolute truth does not yet make itself real and present in actual consciousness, but men are torn out of themselves. They still find this content of spirit within themselves, introduced as into a strange vessel full of the most intense impulses and desires of physical and intellectual life, but it is like a ponderous stone, whose enormous pressure they only feel, but which they neither digest nor assimilate with their own impulses or desires. Thus they can only find rest and reconciliation when they come absolutely out of themselves, and they have become fierce and savage in the very circumstances and by the very means which ought to have rendered their spirit peaceable and mild.

Just as truth was not yet the foundation of reality, so science was likewise destitute of firm basis. The understanding, when it comes to think, applies itself, it is true, in the first place to the mysteries of religion, which, as an altogether speculative content, exist for the rational Notion only. But as Spirit, the rational element in question, has not yet taken its place in thought, thought is still God-forsaken, it is still only abstract, finite understanding, a manner of thinking which is in itself quite formal and devoid of content, which is a stranger to subjects of such profundity as this, even when it is ostensibly occupying itself with the same. This understanding therefore draws its content entirely from things to which it remains altogether alien, and which remain altogether alien to it; yet it is not thereby at all circumscribed, for it observes no bounds in its determinations

and distinctions. It is just as if one were to arbitrarily form and connect propositions, words and tones — without making the presupposition that they should by themselves express a concrete sense — which need be only capable of being uttered, without having any restriction except possibility, that is, that they must not contradict each other.

In the second place, in so far as the understanding keeps to the given religious content, it can prove this content; one can demonstrate that it must be so, just as if it were a geometrical proposition. But there still remains something to be desired, in order that the satisfaction may be complete; the content is proved, but I nevertheless do not understand it. Thus Anselm's excellent proposition (*supra*, pp. 63, 64) in which we may perceive the general character of the scholastic understanding, is a proof, it may be admitted, of the existence of God, but it shows no comprehension of it. Though I see the truth of the proposition, I have not attained to the final point, the object of my desire; for there is lacking the I, the inner bond, as inwardness of thought. This lies only in the Notion, in the unity of the particular and the universal, of Being and thought. For the comprehension of this unity, without which there could be no true proof, it was implied that further progress should not take place after the manner of the understanding. It was necessary that from the nature of thought itself it should become evident how, taken on its own account, it negates itself, and how the determination of Being itself rests therein, or that the manner in which thought determines itself into Being should be shown forth. On the other hand it must in like manner be demonstrated in the case of Being that it is its peculiar dialectic to abrogate itself, and from itself to make itself a universal Notion. The determination of itself into Being is certainly an object of thought, whose content is thought itself. This is inwardness, not a mere conclusion drawn from presuppositions. Here in scholastic

philosophy, however, the object is not the nature of thought and Being, for what they are is a mere matter of assumption.

The understanding may take its start from experience, a given concrete content, a determinate contemplation of nature, the human heart, right, duty, which are just exactly what inwardness means. It may find its determinations, so to speak, on behalf of this content, and starting from this point it may come to abstractions, such as matter and force in physics. In this case, although a general form such as this does not satisfy the content, it has at any rate therein a fixed point, by which it can regulate itself, and a boundary line for speculation, which would otherwise have no limit set to its roaming. Or when we have the concrete perception of state and family, reasoning has in this content a fixed point which gives it guidance — a conception, which is the main thing; the deficiency in its form becomes concealed and forgotten, and emphasis is not laid on it. But in scholastic philosophy, in the third place, a basis was not sought in such objects as direct the course of reflection; with this understanding of the Scholastics it was rather the case that they received in the categories the external culture of the understanding as tradition, and enlarged upon it. Because there was no standard set up for this scholastic understanding, either by concrete intuition or by the pure Notion, it remained unregulated in its externality. In later times this spirit-forsaken understanding came across the philosophy of Aristotle, in an external way; but that philosophy is a two-edged sword, a highly determinate, clear understanding, which is at the same time speculative Notion; in it the abstract determinations of the understanding, taken by themselves, and powerless thus to stand, pass away by means of dialectic, and have truth only when taken in their connexion. The speculation that we find in Aristotle has this condition, that such thought never abandons itself to free reflection, but keeps ever before it the concrete nature of the object; this nature is the Notion of the thing, and this

speculative essence of the thing is the ruling spirit, which does not leave the determinations of reflection free on their own account. But the Scholastics laid down hard and fast the abstract determinations of the understanding, which are always inadequate to their absolute subject, and in like manner they took every example from life as subject, and since the concrete contradicts them, they could hold fast by these determinations of the understanding only by defining and limiting. In so doing, however, they involved themselves in an endless web of distinctions, which could themselves be held in the concrete, and maintained thereby alone. There is thus no "healthy human understanding" in such procedure of the Scholastics; the former cannot oppose itself to speculation, but it can very well take up a position hostile to ungrounded reflection, seeing that it contains a basis and a rule of guidance for abstract determinations of the understanding. The Aristotelian philosophy is quite opposed to this Scholastic procedure, but it became therein alienated from itself. The fixed conception of the supersensuous world with its angels and so on was a subject which the Scholastics elaborated without any regulating standard, in barbaric fashion, and they enriched and embellished it with the finite understanding and with the finite relationships of the same. There is present no immanent principle in the thinking itself, but the understanding of the Scholastics got into its possession a ready-made metaphysic, without the need of making it relate to the concrete; this metaphysic was killed, and its parts in their lifelessness were separated and parcelled out. It might be said of the Scholastics that they philosophized without conception, that is, without a concrete; for *esse reale, esse formale, esse objectivum, quidditas* (τὸ τί ἦν εἶναι) they made their subjects of discussion.

This crude understanding, in the fourth place, made everything equal, reduced it all to the same level, and that in virtue of its abstract universality, which was held to be valid. In politics also the understanding aims at

making all alike equal. This crude understanding did not make away with itself and its finitude, but in its dealings with them simply reduced to finite relations Heaven, the Idea, the intellectual, mystic, speculative world; for it makes no difference (and can make none) whether its finite determinations are valid here or not. Hence arose these senseless questions, and the endeavours to decide them; for it is senseless, I may even say it is distasteful and revolting, although it may be logically correct, to carry over determinations into a field where they are utterly out of place, as soon as it comes to be a matter of comprehending a concrete content in its universality. This understanding in its operations furnishes no bridge from the universal to the particular, and the conclusions which it draws it leaves up in the clouds as conceptions of its fancy. If, for instance, law is divided into canonical law, criminal law, and so on, the ground of division is not taken from the universal itself; and it is thus left vague which particular determination is in accordance with the universal object. If this object is God, — for instance, such a determination as that He became man — the relation between God and man is not derived from their nature. Because God only manifests Himself, He can do so in any way whatever; then, because nothing is impossible with God, the pumpkin idea is easily introduced (p. 90), since it is a matter of indifference in which determination the Universal is supposed to be. Regarding the apple in Paradise the understanding asks to what species of apple it belonged.

We must go on to indicate the principles which have been adopted and stand opposed to one other, and the development of the same, in order to comprehend the transition into modern history and the present standpoint of philosophy. For this reason we must speak of the further progress of universal spirit. For thought was distorted by reason of its being bound to an externality, and spirit was in it no longer acting for spirit. Because then in this and similar ways the Idea of spirit had, as it were, its heart pierced

through, the parts remained without spirit and life, and were worked upon by the understanding. Amongst the learned ignorance of the rational was displayed, a complete and unnatural lack of spirituality; and in the same way there was the most utter and terrible ignorance amongst the others, the monks. This destruction of knowledge brought about the transition to a different state of affairs; while heaven and the divine were thus degraded, the lofty aspirations and high spiritual claims of the clerical element rose above the secular. For we saw that the supersensuous world of truth, as the world of religious conceptions, was ruined by the understanding making all things equal. We saw, on the one hand, a handling of dogma in philosophic fashion, but we saw also a development of formal logical thought, the secularization of the absolutely existent content. In the same way the existing Church, this presence of heaven upon earth, brought itself down to the level of the secular, by entering upon the possession of riches and lands. In this way the distinction between the world and the Church is blotted out, not in a rational manner as regards the Church, but in a way that is altogether revolting, and which amounts to destruction: it is a reality, I grant, but one most terrible and barbarous. For state, government, right, property, civil order, all these enter into religion as rational differences, that is, laws on their own account fixed. The acknowledgment of ranks, classes, divisions, their different occupations, the stages and degrees of evil, as well as of good, are an entering into the form of finitude, actuality, existence of the subjective will, while what is religious has only the form of infinity. But the Church in its outward existence is inviolable, it can throw over all the laws of the good; every offence against it is a violation of sanctity. Evil and its penalties are made eternal, divergences of opinion are punished even with death: so are heresy and also heterodoxy in respect of the most abstract and empty determinations of an endless system of dogmas. Abominable practices and evil passions, utter wantonness, voluptuousness, bribery,

dissoluteness, avarice, crimes of all kinds found their way into the Church, because it was unrestrained by laws; and it founded and maintained the system of government. The secular ought to be only secular; but this whole secular government of the Church claims at the same time the dignity and authority of the divine. This mingling of the sacred, divine, inviolable, with temporal interests, begets, on the one hand, fanaticism, as among the Turks, and on the other hand, the humility and *obedientia passiva* of the laity against this dread power. It was this ruin of the supersensuous world, as represented in knowledge and as the actual Church, that inevitably forced man out of a temple such as this, the Holy of Holies degraded into finitude.

Against this disunion, on the other hand, the secular element has spiritualized itself in itself; or it has established itself firmly in itself, and that in a manner which the Spirit justifies. To religion was lacking the presence of its culminating point, the present reality of its head; to the present secularity there is lacking the presence in it of thought, reason, spirit. In the tenth century there was manifested in Christendom a general impulse to build churches, although it was not possible to regard God Himself as present therein. It was thus that Christianity rose up, in her longing to take to herself the principle of reality as absolutely her own. But neither these buildings, nor external wealth, nor the power and dominion of the Church, nor monks, nor clergy, nor Pope, are the principle of real actual presence in her; they were insufficient for the spiritual. The Pope or the Emperor is not Dalai-lama, the Pope is only the Vicar of Christ; Christ, as a past existence, is in memory and hope alone. Impatient at the lack of reality and at the want of holiness, Christendom goes to seek this true Head; and this is the ruling motive of the Crusades. Christendom sought Christ's outward presence in the land of Canaan, the traces of Him, the mount where He suffered, His grave; they took possession of the Holy Sepulchre. What they represent to themselves as real they also take possession of in fact as

real; but a grave is a grave — all that they find is a grave, and even that is torn from them. “Because Thou wilt not leave my soul in hell, neither wilt Thou suffer Thine Holy One to see corruption.” Christians made the mistake of thinking that they would find satisfaction in this; this was the true object of their search; but they did not understand themselves. These holy spots, the Mount of Olives, the Jordan, Nazareth, as external sensuous presence of place without presence of time, are things of the past, a mere memory, no perception of the immediate present; the Christians found only their loss, their grave, in this present. Barbarians all the time, they did not seek the universal, the world-controlling position of Syria and Egypt, this central point of the earth, the free connection of commerce; Bonaparte did this when mankind became rational. The Crusaders were by the Saracens and by their own violence and repulsiveness, as also by their own misery (p. 53), brought to confess that they had in this deceived themselves. This experience taught them that they must hold to the actual reality which they despised, and seek in this the realization of their intelligible world. What they sought for they were to find in themselves, in the present of the understanding; thought, personal knowledge and will constitute this present. Because their acts, their aims and their interests are upright, and thus are constituted the Universal, the present is rational. What pertains to the world has thus become fixed in itself, that is, it has received into itself thought, justice, reason.

With reference to the general aspect of the period, from an historical point of view, it may be remarked that as on the one side we see the selflessness of spirit, the fact that spirit is not at home with itself, the torn and rent condition of man, on the other side we see the political condition becoming more consolidated, in the establishment of an independence which is no longer merely selfish. In the first independence there is contained the moment of barbarism, which has need of fear in order to be

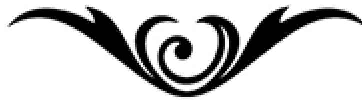
held within bounds. Now, however, we see justice and order enter in; it is true that the ruling order is the feudal system with its servitude, but everything therein has certainly a firm basis in justice. Justice, however, has its root in freedom, and thus the individual therein brings himself into existence, and is recognized; nevertheless relationships which properly belong to the state are here still made the concern of private individuals. Feudal monarchy, which now emerges in opposition to the self-abnegation of the Church, determines essential rights, it is true, according to birth; ranks are not, however, like the system of caste among the Indians, for in the ecclesiastical hierarchy, for instance, anyone might from the lowest class rise to the very highest position. Even under the feudal system, moreover, justice, civil order, legal freedom gradually emerged. In Italy and Germany cities obtained their rights as citizen republics, and caused these to be recognized by the temporal and ecclesiastical power; wealth displayed itself in the Netherlands, Florence and the free cities on the Rhine. In this way men gradually began to emerge from the feudal system; an example of this is seen in the case of the Capitani. The fact that the *lingua volgare* became the language used may also be looked on as a springing up of self-abnegation of spirit: as in Dante's *Divina Commedia*.

The spirit of the times took this new direction; it forsook the intellectual world, and looked upon its present world, this hither side. The finite heaven, the content which had lost its religious character, drove it to the finite present. With this revolution the scholastic philosophy sinks and is lost, as its thoughts are outside of reality. While the Church heretofore believed itself to be in possession of divine truth, so now the temporal government, as it received into itself order and right, and worked its way out through the hard discipline of service, felt itself to be a divine institution, and consequently considered that it had the divine element here present in it, and that it was justified in having an independent existence in opposition to

the divine element in the Church, which takes up an exclusive position as regards the laity. Since in this way the temporal power, the worldly life, self-consciousness, has taken into itself the higher and more divine ecclesiastical principle, the harsh contrast has disappeared. The power of the Church appeared as the violence of the Church, not aiming at operating in accordance with reality and in reality, but at being mighty in the spirit. There at once came into the secular element the consciousness that abstract Notions were filled with the reality of the present, so that this was no longer a nullity, but had truth also in itself.

With this commerce and the arts are associated. It is implied in the arts that man brings what is divine out of himself; as artists were at one time so pious that as individuals they had self-abnegation as their principle, it was they from whose subjective abilities these representations were produced. With this is connected the circumstance that the secular knew that it had in itself the right to hold to such determinations as are founded on subjective freedom. In his handicraft the individual is taken in reference to his work, and is himself the producer. Thus men came to the point of knowing that they were free, and insisting on the recognition of that freedom, and having the power of exercising their activity for their own objects and interests. Thus spirit came again to itself; it drew itself together again, and looked into its reason, as if looking into its own hands. This new birth is pointed out as the revival of the arts and sciences which were concerned with present matter, the epoch when the spirit gains confidence in itself and in its existence, and finds its interest in its present. It is in reality reconciled with the world, not implicitly, far away in mere thought, at the last day, at the world's transfiguration, *i.e.* when the world is reality no more, but it has to do with the world as not by any means annihilated. The man who was moved to seek what was moral and right, could no longer find it on such soil, but looked round about him to seek it elsewhere. The place which was

pointed out to him is himself, his inner life, and external Nature; in the contemplation of Nature the spirit begins to have a sense of being present therein.



SECTION THREE. Revival of the Sciences

THE DEEPER INTEREST of the subject had been lost sight of, as we have seen, in the dryness and dulness of the content of thought, and in speculations which went wandering off into endless details. But now spirit gathered itself together, and rose to claim the right to find and know itself as actual self-consciousness, both in the supersensuous world and in immediate nature. This awakening of the self-hood of spirit brought with it the revival of the arts and sciences of the ancient world. This looked like a falling back into childhood, but it was really a spontaneous ascent into the Idea, a movement originating with self — while up to this time the intellectual world had been rather something given from without. From this proceeded all efforts and all inventions, the discovery of America and of the way to the East Indies. Thus in a very special way the love for the old, so-called heathen sciences once more awoke, for men turned to the works of the ancients, which had now become objects of study, as *studia humaniora*, where man is recognized in what concerns himself and in what he effects. These sciences, though at first they were placed in opposition to the divine, are rather themselves the divine, as living, however, in the reality of spirit. Men, because they are men, find it interesting to study men as men. With this a further consideration is intimately connected, namely, that when the formal culture of the mind, found among the Scholastics, became transformed into the Universal, the result necessarily was that thought knew and found itself in itself; from this the antithesis between the finite understanding and ecclesiastical dogma or faith consequently arose. The idea became prevalent that the understanding can recognize something to be false which the Church affirms to be true; and it was of importance that the

understanding did so apprehend itself, although it was in opposition to the positive in general.

A. Study of the Ancients.

THE FIRST WAY in which the desire to find the human element in reference to what pertains to science manifested itself, was that an interest in such matters sprang up in the West, a receptive power where the ancients in their definiteness and beauty are concerned. But the revival of the arts and sciences, and especially of the study of ancient literature bearing on Philosophy, was at first in some measure a simple revival of the old philosophy in its earlier and original form, without anything new being added; this working up of old philosophies, to which a great number of writings were devoted, was thus the restoration of something forgotten only. The study of the Greeks was more especially revived; the knowledge of the Greek originals which the West acquired is connected with external political events. The West kept up constant intercourse with the Greeks through the Crusades, and Italy did so by means of commerce; yet there were no special diplomatic relations. Even the Roman laws were brought back from the East, until a code of the *corpus juris* was by chance discovered. But the West was again, and more effectually, brought into touch with the Greek East when, on the disastrous fall of the Byzantine Empire, the noblest and most distinguished of the Greeks fled to Italy. Earlier than this even, when the Greek Empire was being harassed by the Turks, ambassadors had been sent to the West in order to solicit help. These ambassadors were men of learning, and by their means — for as a rule they settled in the West — there was transplanted thither that love for antiquity to which we have referred. Petrarch in this way learned Greek from Barlaam, a monk in Calabria, where dwelt many belonging to the order of St. Basil; this order had monasteries in the south of Italy, and used Greek ritual. In

Constantinople Barlaam had made the acquaintance of Greeks, particularly of Chrysoloras, who from 1395 chose Italy as his permanent dwelling-place. These Greeks made the West familiar with the works of the ancients, especially of Plato.[55] Too much honour is done to the monks when it is asserted that they preserved for us the writings of the ancients; these works, at least such as were in Greek, came rather from Constantinople, while the Latin portion of them, it is true, were preserved in the West. Acquaintance was now also for the first time made with Aristotle's own writings (*supra*, p. 75), and thereby the old philosophies were again revived, although mingled with intellectual vagaries of the utmost wildness.

Thus it was partly the old Platonic philosophy that was sought out, and partly the Neo-Platonic, as also the Aristotelian and Stoic, the Epicurean as far as it regarded physics, and the popular philosophy of Cicero in its first form; these were brought forward as authorities against Scholasticism, being in direct contradiction to it. Such endeavours are, however, connected rather with the history of literature and culture, and with the advancement of the same; we do not find originality in this philosophic work, nor can we recognize therein any forward step. We have still writings of that period, by which we find that each school of the Greeks found its adherents, and that Aristotelians, Platonists, and so on appeared on the scenes, though they were of a very different stamp from those of olden times. For true instruction in philosophy we must, however, go to the original sources, the ancients.

1. Pomponatius.

Pomponatius was one of the most remarkable of these Aristotelians; among other subjects he wrote in 1534 on the immortality of the soul, and in so doing he showed — following a practice which was specially in vogue at that time — that this dogma, which he believed as a Christian, was

according to Aristotle and reason incapable of proof.[56] The disciples of Averroës alleged that the universal νοῦς, which is present in thought, is immaterial and immortal, while the soul as numerically one is mortal; and Alexander Aphrodisiensis also maintained its mortality. Both of these opinions were condemned in 1513 at the Council of Benevento, under Leo X.[57] The vegetative and sensitive soul Pomponatius asserted to be mortal (c. VIII. p. 36; c. IX. pp. 51, 62-65): and he maintained that it is only through thought and reason that man partakes of immortality. Pomponatius was summoned before the Inquisition; but as cardinals protected him, no further notice was taken of the matter.[58] There were many other pure Aristotelians; especially among the Protestants at a later time were they general. The Scholastics were erroneously termed Aristotelians; therefore the Reformation was opposed to Aristotle only in appearance, but to the Scholastics it was opposed in fact.

2. Bessarion, Ficinus, Picus.

Men now began to form acquaintance more especially with Plato, when manuscripts of his works were brought from Greece; Greeks, refugees from Constantinople, gave lectures on Plato's philosophy. Cardinal Bessarion of Trapezunt, at one time Patriarch of Constantinople, was specially active in making Plato known in the West.[59]

Ficinus, who was born in Florence in 1433, and died in 1499, the accomplished translator of Plato, was a man of note; it was mainly due to him that the study of Neo-Platonism, as presented by Proclus and Plotinus, was again revived. Ficinus wrote also a Platonic Theology. One of the Medici in Florence, Cosmo II., went so far as to found a Platonic Academy even in the fifteenth century. These Medici, the elder Cosmo, Lorenzo, Leo

X., Clement VII., were patrons of all the arts and sciences, and made their court the resort of classical Greek scholars.[60]

Two counts of the name of Pico della Mirandola — Giovanni, and Giovanni Francesco, his nephew — were influential rather by virtue of their marked personality and their originality; the elder propounded nine hundred theses, fifty-five of which were taken from Proclus, and invited philosophers one and all to a solemn discussion of the same; he also in princely fashion undertook to pay the travelling expenses of those at a distance.[61]

3. Gassendi, Lipsius, Reuchlin, Helmont.

Somewhat later, and specially by Gassendi, the opponent of Descartes, the atom theory of Epicurus was again revived. As a development therefrom the theory of molecules maintained its place thenceforth in physical science.

The revival of Stoic philosophy due to Lipsius was not so clearly evidenced.

In Reuchlin (Kapnio), who was born at Pforzheim in Swabia in 1455, and who was himself the translator of several comedies of Aristophanes, the Cabalistic philosophy found a defender. He endeavoured also to reconstruct the Pythagorean philosophy proper; but he mingled with it much that is vague and mysterious. There was in hand a project to destroy all Hebrew books in Germany by an imperial decree, as had been done in Spain; Reuchlin deserves great credit for having prevented this.[62] On account of the entire lack of dictionaries, the study of the Greek language was rendered so difficult that Reuchlin travelled to Vienna for the purpose of learning Greek from a Greek.

Later on we find many profound thoughts in Helmont, an Englishman, who was born in 1618, and died in 1699.[63]

All these philosophies were carried on side by side with belief in Church dogmas, and without prejudice thereto; not in the sense in which the ancients conceived them. A mass of literature exists on this subject, containing the names of a multitude of philosophers, but it is a literature of the past, without the vitality characteristic of higher principles; it is in fact not a true philosophy at all, and I shall therefore not dwell any longer upon it.

4. Ciceronian Popular Philosophy.

Cicero's mode of philosophizing, a very general mode, was revived in an especial degree. It is a popular style of philosophizing, which has no real speculative value, but in regard to general culture it has this importance, that in it man derives more from himself as a whole, from his outer and inner experience, and speaks altogether from the standpoint of the present. He is a man of understanding who says, —

"What helps a man in life, is what life itself has taught him."

The feelings, &c., of man obtained due recognition, we must observe, as against the principle of self-abnegation. A very large number of writings of this kind were issued, some of them simply on their own account, others aimed against the Scholastics. Although all that great mass of philosophical writings — much, for instance, that Erasmus wrote on similar subjects — has been forgotten, and though it possesses little intrinsic value, it was still of very great service, as succeeding the barrenness of the Scholastics and their groundless maunderings in abstractions: — groundless I say, for they had not even self-consciousness as their basis. Petrarch was one of those who wrote from himself, from his heart, as a thinking man.

This new departure in Philosophy applies in this regard to the reform of the Church by Protestantism also. Its principle is simply this, that it led man back to himself, and removed what was alien to him, in language especially.

To have translated for German Christians the book on which their faith is grounded, into their mother-tongue, is one of the greatest revolutions which could have happened. Italy in the same way obtained grand poetic works when the vernacular came to be employed by such writers as Dante, Boccaccio and Petrarch; Petrarch's political works were however written in Latin. It is not until a thing is expressed in my mother tongue that it becomes my own possession. Luther and Melancthon cast the Scholastic element quite aside, and drew their conclusions from the Bible, from faith, from the human heart. Melancthon presents to us a calm popular philosophy, in which the human element makes itself felt, and which therefore forms the most striking contrast to the lifeless and jejune Scholasticism. This attack against the Scholastic method was made in the most different directions and in the most various forms. But all this belongs rather to the history of Religion than to that of Philosophy.

B. Certain Attempts in Philosophy.

A SECOND SERIES of writers who now appeared have mainly to do with particular attempts made in Philosophy which remained attempts merely, and are only found while this terrible time of upheaval lasted. Many individuals of that period saw themselves forsaken by what had hitherto been accepted by them as content, by the object which up to this time had formed the stay and support of their consciousness — by faith. Side by side with the peaceful reappearance of the ancient philosophy there displayed itself, on the other hand, a multitude of individuals in whom a burning desire after the conscious knowledge of what is deepest and most concrete was violently manifested. It was spoilt, however, by endless fancies, extravagances of the imagination and a craze for secret, astrological, geomantic and other knowledge. These men felt themselves dominated, as they really were, by the impulse to create existence and to derive truth from their very selves. They were men of vehement nature, of wild and restless character, of enthusiastic temperament, who could not attain to the calm of knowledge. Though it cannot be denied that there was in them a wonderful insight into what was true and great, there is no doubt on the other hand that they revelled in all manner of corruption in thought and heart as well as in their outer life. There is thus to be found in them great originality and subjective energy of spirit; at the same time the content is heterogeneous and unequal, and their confusion of mind is great. Their fate, their lives, their writings — which often fill many volumes — manifest only this restlessness of their being, this tearing asunder, the revolt of their inner being against present existence and the longing to get out of it and reach certainty. These remarkable individuals really resemble the upheavals,

tremblings and eruptions of a volcano which has become worked up in its depths and has brought forth new developments, which as yet are wild and uncontrolled. The most outstanding men of this nature are Cardanus, Bruno, Vanini, Campanella, and lastly Ramus. They are representative of the character of the time in this interval of transition, and fall within the period of the Reformation.

1. Cardanus.

Hieronymus Cardanus is of their number; he was remarkable as an individual of world-wide reputation, in whom the upheaval and fermentation of his time manifested itself in its utmost violence. His writings fill ten folio volumes. Cardanus was born in 1501 at Pavia, and died at Rome in 1575. He recounted his own history and described his character in his book *De vita propria*, where he makes an extraordinary confession of his sins, passing the severest possible judgment upon them. The following may serve to give a picture of these contradictions. His life was a series of the most varied misfortunes, external and domestic. He speaks first of his pre-natal history. He relates that his mother, when pregnant with him, drank potions in order to produce abortion. When he was still at the breast, there was an outbreak of the plague; the nurse who suckled him died of the pestilence, he survived. His father was very severe in his treatment of him. He lived sometimes in the most crushing poverty and the utmost want, sometimes in the greatest luxury. Afterwards he applied himself to science, became a Doctor of Medicine, and travelled much. He was celebrated far and wide; summons came to him from every quarter, several times he was called to Scotland. He writes that he cannot tell the sums of money that were offered to him. He was professor at Milan, first of mathematics and then of medicine; after that he lay for two years in Bologna in the strictest imprisonment, and had to undergo the most frightful

tortures. He was a profound astrologer, and predicted the future for many princes, who on that account held him in the greatest awe and reverence.[64] He is a name of note in mathematics; we have from him still the *regula Cardani* for the solution of equations of the third degree, the only rule we have had up to this time.

He lived his whole life in perpetual inward and outward storms. He says that he suffered the greatest torments in his soul. In this inward agony he found the greatest delight in inflicting torture both on himself and others. He scourged himself, bit his lips, pinched himself violently, distorted his fingers, in order to free himself from the tortures of his spiritual disquietude and induce weeping, which brought him relief. The same contradictions were to be seen in his outward demeanour, which was sometimes quiet and decorous, while at other times he behaved as if he were crazy and demented, and that without any external provocation whatever, and in matters the most indifferent. Sometimes he put on decent clothes and made himself neat and trim, at other times he went in rags. He would be reserved, diligent, persevering in his work, and then would break out into excesses, wasting and squandering all that he had, his household goods and his wife's jewels. Sometimes he would walk quietly along, like other men; at other times he would rush on as if he were mad. The upbringing of his children, as was quite to be expected under the circumstances, was very bad. He had the unhappiness of seeing his sons turn out ill; one of them poisoned his own wife and was executed with the sword; he had his second son's ears cut off, to chastise him for being dissipated.[65]

He himself was of the wildest temperament, brooding deeply within himself, and yet breaking out into violence in the most contradictory manner; within him there also raged a consuming restlessness. I have epitomized the description which he gives of his own character, and now quote it: "I have by nature a mind of philosophic and scientific cast; I am

witty, elegant, well-bred, fond of luxury, cheerful, pious, faithful, a lover of wisdom, reflective, enterprising, studious, obliging, emulous, inventive, self-taught. I have a longing to perform prodigies, I am crafty, cunning, bitter, versed in secrets, sober, diligent, careless, talkative, contemptuous of religion, vindictive, envious, melancholy, malicious, treacherous, a sorcerer, a magician, unhappy; I am surly to my family, ascetic, difficult to deal with, harsh, a soothsayer, jealous, a ribald talker, a slanderer, compliant, inconstant; such contradictoriness of nature and manners is to be found in me."[66]

His writings are in parts just as utterly unequal as his character. In them he gave vent to the wild vehemence of his nature; they are disconnected and contradictory, and were often written in the direst poverty. They contain a medley of all kinds of astrological and chiromantic superstition, yet lit up here and there with profound and brilliant flashes; there are Alexandrine and Cabalistic mysteries side by side with perfectly lucid psychological observations of his own. He treated astrologically the life and deeds of Christ. His positive merit consists, however, rather in the stimulus which he gave to original production, and in this direction he exercised an important influence on his times. He boasted of the originality and novelty of his ideas, and the craze to be original drove him to the strangest devices. This represents the first form taken by the newly awakened and energizing reason in its spontaneous activity; to be new and different from others was regarded as tantamount to possessing a private claim to science.

2. Campanella.

Tommaso Campanella, a student of Aristotle, represents just such another medley of all possible dispositions. He was born at Stilo, in Calabria, in 1568, and died at Paris in 1639. Many of his writings still remain to us. For seven-and-twenty years of his life he was kept in strict imprisonment at

Naples.[67] Such men as he aroused enormous interest and gave great offence, but on their own account they were productive of very little result. We have still to make special mention of Giordano Bruno and Vanini as belonging to this period.

3. Bruno.

Giordano Bruno was of an equally restless and effervescent temperament, and we see in him a bold rejection of all Catholic beliefs resting on mere authority. In modern times he has again been brought into remembrance by Jacobi (Werke, Vol. IV. Section II. pp. 5-46), who appended to his letters on Spinoza an abstract of one of Bruno's works.[68] Jacobi caused great attention to be paid to Bruno, more especially by his assertion that the sum of Bruno's teaching was the One and All of Spinoza, or really Pantheism; on account of the drawing of this parallel Bruno obtained a reputation which passes his deserts. He was less restless than Cardanus; but he had no fixed habitation on the earth. He was born at Nola in the province of Naples, and lived in the sixteenth century; the year of his birth is not known with certainty. He roamed about in most of the European states, in Italy, France, England, Germany, as a teacher of philosophy: he forsook Italy, where at one time he had been a Dominican friar, and where he had made bitter reflections both upon various Catholic dogmas — for instance, on transubstantiation and the immaculate conception of the Virgin — and upon the gross ignorance and scandalous lives of the monks. He then lived in Geneva in 1582, but there he fell out in the same way with Calvin and Beza, and could not live with them: he made some stay in several other French cities, such as Lyons; and after a time he came to Paris, where in 1585 he formally challenged the adherents of Aristotle, by following a practice greatly in favour in those days (*supra*, p. 112), and proposing for public disputation a series of philosophic theses, which were specially directed

against Aristotle. They appeared under the title *Jord. Bruni Nol. Rationes articulorum physicorum adversus Peripateticos Parisiis propositorum, Vitebergæ apud Zachariam Cratonem, 1588*; he was not successful in them, however, as the position of the Aristotelians was still too well assured. Bruno was also in London; he visited Wittenberg in the year 1586; he likewise stayed in Prague and other universities and towns. In Helmstedt he was high in the favour of the Dukes of Brunswick-Lüneburg in 1589; after that he went to Frankfort-on-Main, where he had several of his works printed. He was a wandering professor and author. Finally he came back to Italy in 1592, and lived in Padua for some time undisturbed, but at last he was seized in Venice by the Inquisition, cast into prison, sent on to Rome, and there in the year 1600, refusing to recant, he was burned at the stake as a heretic. Eye-witnesses, and amongst them Scioppius, recount that he met death with the most unflinching courage. He had become a Protestant when in Germany, and had broken the vows of his order.[69]

Among both Catholics and Protestants his writings were held to be heretical and atheistic, and therefore they were burned and destroyed, or kept in concealment. His complete works are hence very seldom met with; the greatest number of them are to be found in the University Library at Gottingen; the fullest account of them is given in Buhle's History of Philosophy (*supra*, Vol. I. p. 113). His works are for the most part rare, and in many cases interdicted; in Dresden they are still included among prohibited writings, and are therefore not to be seen there. Lately[70] an edition of them in the Italian language was prepared,[71] which possibly has never yet been issued. Bruno also wrote a great deal in Latin. Wherever he took up his abode for a time, he gave public lectures, wrote and published works; and this increases the difficulty of making complete acquaintance with his books. Many of his writings are for the above reason very similar in their matter, the form only being different, and in the evolution of his

thoughts he never consequently advanced very much nor attained to any results. But the leading characteristic of his various writings is really to some extent the grand enthusiasm of a noble soul, which has a sense of indwelling spirit, and knows the unity of its own Being and all Being to be the whole life of thought. There is something bacchantic in his way of apprehending this deep consciousness; it overflows in becoming thus an object of thought, and in the expression of its riches. But it is only in knowledge that spirit can bring itself forth as a whole; when it has not yet attained to this point of scientific culture, it reaches out after all forms, without bringing them first into due order. Bruno displays just such an unregulated and multiform profusion; and on that account his expositions have frequently a dreamy, confused, allegorical appearance of mystical enthusiasm. Many of his writings are in verse, and much that is fantastic finds a place in them, as for instance when he says in one of his works, entitled *La Bestia Trionfante*, that something else must be put in place of the stars.[72] He sacrificed his personal welfare to the great enthusiasm which filled him, and which left him no peace. It is easy to say that he was "a restless being, who could get on with nobody." But whence did this restlessness come to him? What he could not get on with was the finite, the evil, the ignoble. Thence arose his restlessness. He rose to the one universal substantiality by putting an end to this separation of self-consciousness and nature, whereby both alike are degraded. God was in self-consciousness, it was admitted, but externally, and as remaining something different from self-consciousness, another reality; while Nature was made by God, being His creature, not an image of Him. The goodness of God displayed itself only in final causes, finite ends, as when it is said: "Bees make honey for man's food; the cork tree grows to provide stoppers for bottles."[73]

As to his reflections, Jacobi has by his recent[74] exposition of them made it seem as if it were a theory specially characteristic of Bruno that one living

Being, one World-Soul, should penetrate all existence, and should be the life of all. Bruno asserted, in the first place, the unity of life and the universality of the World-Soul, and, in the second place, the indwelling presence of reason; but Bruno in so saying is far from being original, and in fact this doctrine is a mere echo of the Alexandrian. But in his writings there are two specially marked features. The first is the nature of his system, based as it is on his leading thoughts, or his philosophic principles generally, namely the Idea as substantial unity. The second, which is closely connected with the first, is his use of the *Art* of Lullius; this is specially emphasized and highly esteemed by him, the art of finding differences in the Idea: it he wished to bring into special recognition.

a. His philosophic thoughts, to express which he sometimes made use of Aristotle's concepts, give evidence of a peculiar, highly strung and very original mind. The substance of his general reflections is found in the greatest enthusiasm for the above-mentioned vitality of Nature, divinity, the presence of reason in nature. His philosophy is thus on the whole certainly Spinozism, Pantheism. The separation of man from God or the world, all such relations of externality, have been superadded to his living idea of the absolute, universal unity of all things, for the expression of which idea Bruno has been so greatly admired. In his conception of things the main points are that, on the one hand, he gives the universal determination of matter, and, on the other hand, that of form.

α. The unity of life he thus determines as the universal, active understanding (νοῦς), which manifests itself as the universal form of all the world, and comprehends all forms in itself; it bears the same relation to the production of natural objects as does the understanding of man, and moulds and systematizes them, as the human understanding moulds the multitude of its concepts. It is the artist within, who shapes and forms the material without. From within the root or the seed-grain it makes the shoot come

forth; from this again it brings the branches, and from them the twigs, and from out of the twigs it calls forth the buds, and leaves, and flowers. All is planned, prepared and perfected within. In the same way this universal reason within calls back their saps from the fruits and blossoms to the twigs, and so on. The universe is thus an infinite animal, in which all things live and move and have their being in modes the most diverse. The formal understanding is thus in no wise different from the Final Cause (the Notion of end, the entelechy, the unmoved principle, which we meet with in Aristotle); but these are just as truly also active understanding, the efficient cause (*causa efficiens*), this same producing force. Nature and Spirit are not separated; their unity is the formal understanding, in which is contained the pure Notion, not as in consciousness, but as free and independent, remaining within itself, and at the same time exercising activity and passing beyond itself. The understanding working towards one particular end is the inward form of the thing itself, an inward principle of the understanding. What is continually produced is in accordance with this form, and contained within it; what appears is determined as the form is in itself determined.[75] With Proclus in the same way the understanding, as substantial, is that which includes all things in its unity: life is the outgoing, the producing force: and the understanding as such similarly includes the returning force, which brings all things back into unity. In dealing with Kant's philosophy we shall have again to mention this determination of final purpose. That which has organic life, whose principle is formative, which has its efficacy in itself, and in the same only remains at home with itself and maintains itself, is nothing but the end, the activity determined in itself, which in its relation to what is different does not comport itself as mere cause, but returns upon itself.

β. Bruno, who asserts the final cause to be immediately operative, and the life immanent in the universe, asserts it also to be existent, as substance;

he is therefore opposed to the conception of a merely extra-mundane understanding. To a certain extent Bruno distinguishes form and matter in substance, which itself, as the aforesaid activity of the Idea, is the unity of form and matter; thus matter has life in itself. The permanent element in the endless changes of existence is, he says, the first and absolute matter; although without form, it is nevertheless the mother of all forms, and receptive of all forms. Because matter is not without the first universal form, it is itself principle or in itself final cause. Form is immanent in matter; the one simply cannot exist without the other; thus matter itself brings about these changes of form, and the same matter runs through them all. What was at first seed becomes blade, then ear, then bread, chyle, blood, seed of animal, an embryo, a human being, a corpse, then once more earth, stone, or other substance; from sand and water frogs are produced. Here then we can perceive something which, although it transforms itself into all these things in turn, yet still in itself remains one and the same. This matter cannot be a body, for bodies have form; nor can it belong to the class which we term properties, attributes, or qualities, for these are liable to change. Thus nothing seems to be eternal and worthy of the name of a principle, except matter. Many have for this reason held matter to be the only reality, and all forms to be accidental. This error arises from the fact of their recognizing only a form of the second kind, and not that necessary first and eternal form, which is the form and source of all forms. In the same way the aforesaid matter, on account of its identity with the understanding which causes form beforehand, is itself intelligible, as the universal presupposition of all corporeality. Because it is everything in general, it is nothing in particular, neither air nor water, nor anything else, abstract or otherwise; it has no dimensions, in order to have all dimensions. The forms of matter are the inward power of matter itself; it is, as intelligible, the very totality of

form.[76] This system of Bruno's is thus objective Spinozism, and nothing else; one can see how deeply he penetrated.

Bruno here asks the question: "But this first universal form and that first universal matter, how are they united, inseparable? Different — and yet one Being?" He answers by making use of the Aristotelian forms of δύναμις and ἐνέργεια: Matter is to be regarded as potentiality; in this way all possible forms of existence in a certain sense are included in the Notion of it. The passivity of matter must be regarded as pure and absolute. Now it is impossible to attribute existence to a thing which lacks the power to exist. Existence has, however, such an express reference to the active mode, that it is at once clear that the one cannot exist without the other, but that each of them presupposes the other. If therefore at all times a capacity of working, producing, creating, was there, so must there also have been at all times a capacity of being worked upon, produced, created. The perfect potentiality of the existence of things (matter) cannot precede their actual existence, and just as little can it remain after that is past. The first and most perfect principle includes all existence in itself, can be all things, and is all things. Active power and potentiality, possibility and actuality are therefore in it one undivided and indivisible principle.[77] This simultaneousness of acting and being acted upon is a very important determination; matter is nothing without activity, form is therefore the power and inward life of matter. If matter were nothing but indeterminate potentiality, how would the determinate be arrived at? This simplicity of matter is itself only one moment of form: in wishing therefore to tear asunder matter and form, matter is at once established in one determination of form, but in so doing there is immediately established also the existence of the Other.

Thus the Absolute is determined for Bruno: it is not so with other things, which may exist and also may not exist, and which may be determined in one way or in another way. In regard to finite things and in finite

determinations of the understanding the distinction between form and matter is thus present. The individual man is at every moment what he may be at that moment, but not everything which he may be in general and with reference to substance. The things which appear to be different are only modifications of one single thing which includes in its existence all other existence. The universe, unbegotten Nature, is, however, everything which it can be in reality and at one time, because it includes in itself the whole of matter, as well as the eternal, unchangeable form of its changing forms. But in its developments from moment to moment, its particular parts, qualities, individual existences, in its externality as a whole, it is no more what it is and may be; but a part such as this is only a shadow of the image of the first principle.[78] Thus Bruno wrote also a book, *De umbris idearum*.

γ. This is Bruno's fundamental idea. He says: "To recognize this unity of form and matter in all things, is what reason is striving to attain to. But in order to penetrate to this unity, in order to investigate all the secrets of Nature, we must search into the opposed and contradictory extremes of things, the maximum and the minimum." It is in these very extremes that they are intelligible, and become united in the Notion; and this union of them is infinite Nature. "To find the point of union is not the greatest matter; but to develop from the same its very opposite, this is the real and the deepest secret of the art."[79] It is saying much if we speak of knowing the development of the Idea as a necessity of determinations; we shall see later how Bruno proceeded to do this. He represents the original principle, which is elsewhere known as the form, under the Notion of the minimum, which is at the same time the maximum — One, which at the same time is All; the universe is this One in All. In the universe, he says, the body is not distinguished from the point, nor the centre from the circumference, nor the finite from the infinite, nor the maximum from the minimum. There is nothing but centre point; or the centre point is everywhere and in

everything. The ancients expressed the same by saying of the Father of the gods, that he really had his dwelling-place in every point of the universe. It is the universe that first gives to things true reality; it is the substance of all things, the monad, the atom, the spirit poured out on all things, the innermost essence, the pure form.[80]

b. The second object to which Bruno devoted himself was the so-called Lullian Art, which received its name from its first inventor, the Scholastic Raymundus Lullus (*supra*, pp. 92-94). Bruno adopted this and carried it to completion; he termed it also his *ars combinatoria*. This art is in some respects like what we met with in Aristotle under the name of the Topics (Vol. II. pp. 217, 218), seeing that both give an immense number of "places" and determinations which were fixed in the conception like a table with its divisions, in order that these headings might be applied to all that came to hand. But the Topics of Aristotle did this in order to apprehend and determine an object in its various aspects, while Bruno rather worked for the sake of lightening the task of memory. He thus really connected the Lullian Art with the art of mnemonics as practised by the ancients, which has come into notice again in recent times, and which will be found described in greater detail in the *Auctor ad Herennium* (Libr. III. c. 17, *sqq.*). To give an example: one establishes for oneself a certain number of different departments in the imagination, which are to be chosen at pleasure; there may be perhaps twelve of these, arranged in sets of three, and indicated by certain words, such as Aaron, Abimelech, Achilles, Berg, Baum, Baruch, etc., into which divisions one inserts, as it were, what has to be learnt by heart, and forms it into a succession of pictures. In this way when we repeat it, we have not to say it from memory or out of our head, as we are accustomed to do, but we have only to read it off as if from a table. The only difficulty lies in making some ingenious connection between the

content in question and the picture; that gives rise to the most unholy combinations, and the art is therefore not one to be commended. Bruno also soon abandoned it, since what had been a matter of memory became a matter of imagination; which was, of course, a descent. But since with Bruno the diagram is not only a picture of external images, but a system of universal determinations of thought, he certainly gave to this art a deeper inward meaning.[81]

α. Bruno passes over to this art from universal ideas which are given. Since namely one life, one understanding is in all things, Bruno had the dim hope of apprehending this universal understanding in the totality of its determinations, and of subsuming all things under it — of setting up a logical philosophy by its means, and making it applicable in all directions.[82] He says: The object of consideration therein is the universe, in so far as it enters into the relation of the true, the knowable and the rational. Like Spinoza he distinguishes between the intelligible thing of reason and the actual thing: As metaphysics has for object the universal thing, which is divided into substance and accident, so the chief matter is that there is a single and more universal art which knits together and compasses round the thing of reason and the actual thing, and recognizes them both as harmonizing with one another, so that the many, be they of what kind they may, are led back to simple unity.[83]

β. For Bruno the principle in all this is the understanding generally: None other than the understanding whose activity extends beyond itself, which brings into existence the sensuous world. It is related to the illumination of the spirit as the sun is related to the eye: it relates therefore to a phenomenal manifold, illuminating this, not itself. The Other is the active understanding in itself, which is related to the objects of thought in their various classes, as the eye is to things visible.[84] The infinite form, the active understanding which dwells in reason, is the first, the principle,

which develops; the process in some respects resembles what was met with in the Neo-Platonists. Bruno's great endeavour is really now to apprehend and demonstrate the modes of organizing this active understanding.

γ. This is presented more in detail as follows: To the pure truth itself, the absolute light, man approaches only; his Being is not absolute Being itself, which alone is the One and First. He rests only under the shadow of the Idea, whose purity is the light, but which at the same time partakes of the darkness. The light of substance emanates from this pure First Light, the light of accident emanates from the light of substance. This we met with also in Proclus (*supra*, Vol. II. p. 446) as the third moment in the first triad. This absolute principle in its unity is for Bruno the first matter, and the first act of this principle he names the original light (*actus primus lucis*). But substances and accidents, which are many, cannot receive the full light, they are therefore only included in the shadow of the light; in like manner the ideas also are only shadows thereof.[85] The development of Nature goes on from moment to moment; created things are only a shadow of the first principle, not the first principle itself.

δ. Bruno continues: From this super-essential (*super-essentiale*) — an expression which is also met with in Proclus (*supra*, Vol. II. p. 441) — advance is made to the essences, from the essences to that which is, from that which is to their traces, images and shadows, and that in a double direction: both towards matter, in order to be produced within her (these shadows are then present in natural fashion), and also towards sensation and reason, in order to be known by means of these. Things withdraw themselves from the First Light towards the darkness. But since all things in the universe are in close connection, the lower with the middle, and those with the upper, the compound with the simple, the simple with those which are more simple, the material with the spiritual, in order that there may be one universe, one order and government of the same, one principle and aim,

one first and last; so, following the sound of the lyre of the universal Apollo (an expression which we saw used by Heraclitus, Vol. I. pp. 284, 285), the lower can be led back step by step to the higher, as fire was condensed and transformed into air, air into water, water into earth. Thus One Being is in all. That process is the same as this return, and they form a circle. Nature within her limits can produce all from all, and so the understanding can also know all from all.[86]

ε. The unity of opposites is explained more in detail as follows: The diversity of shadows is no real opposition. In the same conception the opposites are known, the beautiful and the ugly, the appropriate and the inappropriate, the perfect and the imperfect, the good and the evil. Imperfection, evil, ugliness, do not rest upon special ideas of their own; they become known in another conception, not in one peculiar to themselves, which is nothing. For this that is peculiarly theirs is the non-existent in the existent, the defect in the effect. The first understanding is the original light; it streams its light out of the innermost to the outermost, and draws it again from the outermost to itself. Every Being can, according to its capacity, appropriate somewhat of this light.[87]

ζ. The real element in things is just that which is intelligible, not that which is perceived or felt, or what is peculiar to the individual; whatever else is termed real, the sensuous, is non-Being. All that comes to pass beneath the sun, all that dwells in the region of matter, falls under the notion of vanity (finitude). Seek to take from Ideas a firm basis for thy conceptions, if thou art wise. The pure light of things is nothing but this knowableness, which proceeds from the first understanding and is directed towards it; the non-existent is not known. What is here contrast and diversity, is in the first understanding harmony and unity. Try therefore if thou canst identify the images thou hast received, if thou canst harmonize and unite them; thus thou wilt not render thy mind weary, thy thoughts

obscure, and thy memory confused. Through the idea which is in the understanding a better conception of anything will be formed than by means of the form of the natural thing in itself, because this last is more material: but that conception is reached in a supreme degree through the idea of the object as it exists in the divine understanding.[88] The differences which are here given, are therefore no differences at all; but all is harmony. To develop this was therefore Bruno's endeavour; and the determinations, as natural in that divine understanding, correspond with those which appear in the subjective understanding. Bruno's art consists only in determining the universal scheme of form, which includes all things within itself, and in showing how its moments express themselves in the different spheres of existence.

η. The main endeavour of Bruno was thus to represent the All and One, after the method of Lullus, as a system of classes of regular determinations. Hence in the manner of Proclus he specifies the three spheres: First, the original form (ὑπερουσία) as the originator of all forms; secondly, the physical world, which impresses the traces of the Ideas on the surface of matter, and multiplies the original picture in countless mirrors set face to face; thirdly, the form of the rational world, which individualizes numerically for the senses the shadows of the Ideas, brings them into one, and raises them to general conceptions for the understanding. The moments of the original form itself are termed Being, goodness (nature or life), and unity. (Something similar to this we also met with in Proclus, Vol. II. p. 445) In the metaphysical world the original form is thing, good, principle of plurality (*ante multa*); in the physical world it manifests itself in things, goods, individuals; in the rational world of knowledge it is derived from things, goods and individuals.[89] Unity is the agent that brings them back once more; and Bruno, while distinguishing the natural and metaphysical world, seeks to set up the system of the above determinations, in order to

show at once how the same thing is in one way a natural appearance, and in another way an object existing for thought.

Since Bruno sought to apprehend this connection more closely, he considers thinking as a subjective art and activity of the soul, representing inwardly and in accordance with the ordinary conception, as it were through an inward writing, what Nature represents externally, as it were, through an outward writing. Thinking, he says, is the capability both of receiving into one's self this external writing of nature and of imagining and substantiating the inward writing in the outward. This art of thinking inwardly and organizing outwardly in accordance with the same, and the capacity to reverse the process — an art possessed by the soul of man — Bruno places in the closest connection with the art of the nature of the universe, with the energy of the absolute World-principle, by means of which all is formed and fashioned. It is one form which develops; it is the same world-principle which causes form in metals, plants and animals, and which in man thinks and organizes outside himself, only that it expresses itself in its operations in an endlessly varied manner throughout the entire world. Inwardly and outwardly there is consequently one and the same development of one and the same principle.[90]

In his *Ars Lulliana* Bruno made the attempt to determine and systematize these various writings of the soul, by means of which also the organizing world-principle reveals itself. He assumes therein twelve principal kinds of writing, or classes of natural forms, to form a starting-point: "*Species, Formæ, Simulacra, Imagines, Spectra, Exemplaria, Indicia, Signa, Notæ, Characteres et Sigilli*. Some kinds of writing are connected with the external sense, like external forms, pictures and ideals (*extrinseca forma, imago, exemplar*); these painting and other plastic arts represent, by imitating Mother Nature. Some are connected with the inner sense, where — with regard to mass, duration, number — they are magnified, extended

in time and multiplied; such are the products of fancy. Some are connected with a common point of similarity in several things; some are so divergent from the objective nature of things that they are quite imaginary. Finally, some appear to be peculiar to art, as *signa, notæ, characteres et sigilli*; by means of these the powers of art are so great that it seems to be able to act independently of Nature, beyond Nature, and, when the matter in question involves it, even against Nature."[91]

So far all, on the whole, goes well; it is the carrying out of the same scheme in all directions. All respect is due to this attempt to represent the logical system of the inward artist, the producing thought, in such a way that the forms of external Nature correspond thereto. But while the system of Bruno is otherwise a grand one, in it the determinations of thought nevertheless at once become superficial, or mere dead types, as in later times was the case with the classification of natural philosophy; for Bruno merely enumerates the moments and contrasts of the system, just as the natural philosophers developed the three-fold character in every sphere, regarded as absolute. Further or more determinate moments Bruno has done nothing more than collect together; when he tries to represent them by figures and classifications, the result is confusion. The twelve forms laid down as basis neither have their derivation traced nor are they united in one entire system, nor is the further multiplication deduced. To this part of his subject he devoted several of his writings (*De sigillis*), and in different works it is presented in different ways; the appearances of things are as letters, or symbols, which correspond with thoughts. The idea is on the whole praiseworthy compared with the fragmentariness of Aristotle and the Scholastics, according to whom every determination is fixed once for all. But the carrying out of the idea is in part allied with the Pythagorean numbers, and consequently unmethodical and arbitrary; and in part we find metaphorical, allegorical combinations and couplings, where we cannot

follow Bruno; in this attempt to introduce order, all things are mingled together in the wildest disorder.

It is a great beginning, to have the thought of unity; and the other point is this attempt to grasp the universe in its development, in the system of its determinations, and to show how the outward appearance is a symbol of ideas. These are the two aspects of Bruno's teaching which had to be taken into consideration.

4. Vanini.

Julius Cæsar Vanini has also to be mentioned as belonging to this period; his first name was really Lucilius. He has many points of similarity with Bruno, and, like him, he suffered as a martyr on account of philosophy; for he shared Bruno's fate, which was to be burned at the stake. He was born in 1586 at Taurozano in the province of Naples. He wandered from country to country; we find him in Geneva, and then in Lyons, whence he fled to England in order to save himself from the Inquisition. After two years he returned to Italy. In Genoa he taught Natural Philosophy on the system of Averroës, but did not bring himself into favour. In his travels he met with all manner of strange adventures, and engaged in many and various disputations on philosophy and theology. He became more and more an object of suspicion, and fled from Paris; he was summoned before the tribunal on a charge of impiety, not of heresy. Franconus, his accuser, stated on oath that Vanini had uttered blasphemies. Vanini protested that he had remained faithful to the Catholic Church, and to his belief in the Trinity; and in answer to the charge of atheism he took up a straw from the ground in the presence of his judges, and said that even this straw would convince him of the existence of God. But it was of no avail; in 1619 at Toulouse in France he was condemned to the stake, and before the carrying out of this sentence his tongue was torn out by the executioner. How the case was

proved against him is not, however, clear; the proceedings seem to have been in great part due to personal enmity, and to the zeal for persecution which filled the clergy in Toulouse.[92]

Vanini derived his chief stimulus from the originality of Cardanus. In him we see reason and philosophy taking a direction hostile to theology, while Scholastic philosophy went hand in hand with theology, and theology was supposed to be confirmed thereby. Art developed in the Catholic Church, but free thought broke off from, and remained alien to it. In Bruno and Vanini the Church took her revenge for this; she renounced science, and took up a position of hostility to it.

Vanini's philosophy does not go very far; he admires the living energy of Nature; his reasonings were not deep, but were more of the nature of fanciful ideas. He always chose the dialogue form; and it is not evident which of the opinions stated are his own. He wrote commentaries on Aristotle's works on Physics. We have two other works by Vanini, which are very rare. The one is styled: *Amphitheatrum æternæ providentiæ divino-magicum, christiano-physicum, nec non astrologo-catholicum, adversus veteres philosophos, Atheos, Epicureos, Peripateticos et Stoicos. Auctore Julio Cæsare Vanino, Lugd. 1615*; in this he gives a very eloquent account of all these philosophies and their principles, but the manner in which he refutes them is rather feeble. The second work is entitled "On the Wonderful Secrets of Nature, the Queen and Goddess of Mortals" (*De admirandis Naturæ, reginæ Deæque mortalium, arcanis libr. IV., Lutetiæ 1616*); it was printed "with the approval of the Sorbonne," which at first found in it nothing "which contradicted and was hostile to the Catholic Apostolic and Roman religion." It contains scientific investigations into various matters belonging to physics and natural history, and is also in dialogue form, without definite indication being given as to which of the characters is made the mouthpiece of Vanini's own opinions. What one

finds is assurances from him that he would believe this or that doctrine if he had not received Christian teaching. Vanini's tendency, however, was towards naturalism; he showed that it is Nature that is the Deity, that all things had a mechanical genesis. He therefore explained the whole universe in its connection by efficient causes alone, not by final causes; but the statement of this is made in such a way that the writer does not give it as his own conclusion.[93]

Thus Vanini placed reason in opposition to faith and church dogma, as had already been done by Pomponatius (*supra*, p. 111) and others. Yet all the time that they were proving by reason this or that dogma which is in direct contradiction to the Christian belief, they were declaring that they submitted their conviction to the Church — a course which was always adopted by Bayle afterwards in the reformed church. Another practice of these philosophers was to bring forward all sorts of arguments and theories contradictory of theological dogmas, as so many insoluble difficulties and contradictions brought about by reason, which were, however, by them submitted to faith. Thus, for instance, Bayle says in the article "Manichæans" found in his critical *Dictionnaire* — in which he touches on many philosophic conceptions — that the assertion of the existence of two principles cannot be disproved, but that we must submit herein to the Church. In this fashion all possible arguments were advanced against the Church. Vanini thus states objections against the Atonement, and brings forward arguments to prove that Nature is God. Now men were convinced that reason could not be contradictory of the Christian dogmas, and no faith was placed in the sincerity of a submission which consisted in giving up what one was convinced of by reason; therefore Galileo, because he defended the system of Copernicus, had to recant on his knees, and Vanini was burned at the stake. Both of them had in vain chosen the dialogue form for their writings.

Vanini certainly made one of the speakers in the Dialogues prove (*De naturæ arcanis*, p. 420) even "out of the text of the Bible, that the devil is mightier than God," and that therefore God does not rule the world. Among his arguments are the following: It was against the will of God that Adam and Eve sinned, and thus brought the whole human race to ruin (*ad interitum*): Christ also was crucified by the powers of darkness. Moreover it is the will of God that all men should be saved. But of Catholics there are very few in comparison with the rest of the world, and the Jews often fell away from their faith; the Catholic religion extends only over Spain, France, Italy, Poland and a part of Germany. If there were to be deducted also the atheists, blasphemers, heretics, whoremongers, adulterers, and so on, there would be still fewer left. Consequently the devil is mightier than God. These are arguments of reason; they are not to be refuted; but he submitted himself to the faith. It is remarkable that no one believed this of him; the reason thereof being that it was impossible for him to be in earnest with the refutation of what he asserted to be rational. That the refutation was but weak and subjective does not justify anyone in doubting Vanini's sincerity; for poor reasons may be convincing for the subject, just as the subject holds to his own rights in respect of objective matters. What lies at the bottom of the proceedings against Vanini is this, that when a man by means of his reason has come to perceive something which seems to him incontrovertible, he cannot but adhere to these definite perceptions, he cannot believe what is opposed to them. It is impossible to believe that faith is stronger in him than this power of perception.

The Church in this way fell into the strange contradiction of condemning Vanini, because he did not find her doctrines in accordance with reason, and yet submitted himself to them; she thus appeared to demand — a demand which she emphasized with the burning pile — not that her doctrines should be considered above reason, but in accordance with it, and that reason

should have merely the formal function of explaining the content of theology, without adding anything of her own. This susceptibility of the Church is inconsistent, and entangled her in contradictions. For in earlier times she certainly admitted that reason could not grasp what was revealed, and that it was consequently a matter of little importance to refute and solve by reason the objections which reason itself brought forward. But as she now would not permit the contradiction of faith and reason to be taken seriously, but burned Vanini at the stake as an atheist for professing so to do, it was implied that the doctrine of the Church cannot contradict reason, while man has yet to submit reason to the Church.

There is kindled here the strife between so-called revelation and reason, in which the latter emerges independently, and the former is separated from it. Up to this time both were one, or the light of man was the light of God; man had not a light of his own, but his light was held to be the divine. The Scholastics had no knowledge having a content of its own beyond the content of religion; philosophy remained entirely formal. But now it came to have a content of its own, which was opposed to the content of religion; or reason felt at least that it had its own content, or was opposing the form of reasonableness to the immediate content of the other.

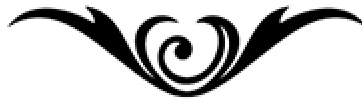
This opposition had a different meaning in former times from what it bears now-a-days; the earlier meaning is this, that faith is the doctrine of Christianity, which is given as truth, and by which as truth man has to remain. We have here faith in this content, and opposed to this stands conviction by means of reason. But now this faith is transferred into the thinking consciousness itself; it is a relation of self-consciousness itself to the facts which it finds within itself, not to the objective content of the doctrine. In respect to the earlier opposition a distinction must be drawn in the objective creed; the one part of it is the teaching of the Church as dogma, the teaching as to the nature of God, that He is Three in One; to this

pertains the appearing of God in the world, in the flesh, the relation of man to this divine nature, His holiness and divinity. That is the part which has to do with the eternal verities, the part which is of absolute interest for men; this part is in its content essentially speculative, and can be object only for the speculative Notion. The other part, belief in which is also required, has reference to other external conceptions, which are connected with that content; to this pertains the whole extent of what belongs to history, in the Old and New Testament as well as in the Church. A belief in all this finite element may be demanded also. If a man, for instance, did not believe in ghosts, he would be taken for a free-thinker, an atheist: it would be just the same if a man did not believe that Adam in Paradise ate of the forbidden fruit. Both parts are placed upon the one level; but it tends to the destruction of Church and faith, when belief is demanded for these parts alike. It is to the external conceptions that attention has been chiefly directed by those who have been decried as opponents of Christianity and as atheists, down to the time of Voltaire. When external conceptions such as these are held to firmly, it is inevitable that contradictions should be pointed out.

5. Petrus Ramus.

Pierre de la Ramée was born in 1515 in Vermandois, where his father worked as a day-labourer. He early betook himself to Paris, in order to satisfy his desire for learning: he was, however, obliged on two occasions to leave it on account of the difficulty he experienced in procuring a subsistence, before he obtained employment as a servant at the *Collége de Navarre*. Here he found an opportunity of extending his knowledge; he occupied himself with the Aristotelian philosophy and with mathematics, and he distinguished himself in disputation by extraordinary oratorical and dialectical readiness. In a disputation for obtaining the degree of *magister*, he came publicly forward with a thesis that caused a great sensation: "All

that Aristotle taught is not true;" and the honour fell to him. Having became *magister*, he attacked so bitterly and violently the Aristotelian logic and dialectic, that the government took notice of it. He was now accused of undermining by his anti-Aristotelian opinions the foundations of religion and science; this accusation was brought before the parliament of Paris by the enemies of Ramus, as a criminal case. But because the parliament appeared disposed to act in a judicial way, and seemed favourably inclined to Ramus, the complaint was withdrawn, and brought before the council of the king. The latter decided that Ramus should hold a disputation with his opponent Goveanus before a special commission of five judges, two of whom Goveanus was to choose, and two Ramus, while the king was to appoint the president; these judges were to lay their opinion of the result before the king. The interest of the public was intense, but the contest was conducted in the most pedantic way. On the first day Ramus maintained that the Aristotelian logic and dialectic were imperfect and faulty, because the *Organon* did not begin with a definition. The commission decided that a disputation or a dissertation requires indeed a definition, but in dialectic it is not necessary. On the second day Ramus criticized the Aristotelian logic for its want of arrangement; this, he asserted, is essential. The majority of the judges, consisting of the commissioner of the king and the two nominees of the opponent Goveanus, now wished to annul the investigation as far as it had gone, and to set to work in another way, since the assertions of Ramus put them in a difficulty. He appealed to the king, who, however, refused to hear him, and decided that the decision of the judges should be considered final. Ramus was hence condemned, but the other two took no share in the matter, and, indeed, resigned. The decision was publicly placarded in all the streets of Paris, and sent to all the academies of learning throughout Europe. Plays aimed against Ramus were performed in the theatres, greatly to the delight of the Aristotelians. The public generally took a very lively interest



in such disputes, and a number of contests of this kind had already taken place on similar questions of the schools. For example, the professors in a royal *Collége* disputed with the theologians of the Sorbonne whether *quidam*, *quisquis*, *quoniam* should be said or *kidem*, *kiskis*, *koniam*, and from this dispute a case before parliament arose, because the doctors took away his benefice from a theologian who said *quisquis*. Another hot and bitter controversy came before the magistrates as to whether *ego amat* was as correct as *ego amo*, and this dispute had to be suppressed by them. Finally Ramus obtained a public educational appointment, a professorship in Paris; but because he had become a Huguenot he had to vacate this office several times in the internal disquietude that prevailed; on one occasion he even went to travel in Germany. On St. Bartholomew's Eve in 1572, Ramus finally fell, murdered through the instrumentality of his enemies; one of his colleagues who was among his bitterest enemies, Charpentier, had engaged assassins for the purpose, by whom Ramus was frightfully maltreated, and then thrown down from an upper window.[94]

Ramus aroused great interest, more especially by his attacks on the Aristotelian dialectic as it had hitherto existed, and he contributed very greatly to the simplification of the formal nature of the rules of dialectic. He is specially famed for his extreme hostility to the scholastic logic, and for having set up in opposition to it a logic of Ramus — an opposition which has spread so far that even in the history of literature in Germany we find various factions of Ramists and anti-Ramists and semi-Ramists mentioned.

There are many other remarkable men who come within this period and who are usually mentioned in the history of Philosophy, such as Michael of Montaigne, Charron, Macchiavelli, etc. The popular writings of the first two contain pleasing, refined and spiritual thoughts on human life, social relationships, the right and good. The efforts of such men are counted as

philosophy in as far as they have drawn from their consciousness, from the sphere of human experience, from observation, from what takes place in the world and in the heart. It is in a philosophy of life that they have comprehended and imparted such experiences; they are thus both entertaining and instructive. In accordance with the principle on which they worked, they entirely forsook the sources from which Scholastic knowledge had up to this time been derived, and also the methods hitherto prevalent of acquiring it. But because they do not make the question of highest interest to Philosophy the object of their investigation, and do not reason from thought, they do not properly belong to the history of Philosophy, but to general culture and to the healthy human understanding. They have contributed to man's taking a greater interest in his own affairs, to his obtaining confidence in himself; and this is their main service. Man has looked within his heart again and given to it its proper value; then he has restored to his own heart and understanding, to his faith, the essence of the relationship of the individual to absolute existence. Although still a divided heart, this division, this yearning, has become a disunion within itself; and man feels this disunion within himself, and along with that his rest in himself. But here we must notice a transition, with which we are concerned, on account of the universal principle which in it is known in a higher way and in its true authority.

C. The Reformation.

IT WAS IN the Lutheran Reformation that the great revolution appeared, as, after the eternal conflicts and the terrible discipline which the stiff-necked Germanic character had undergone and which it had to undergo, mind came to the consciousness of reconciliation with itself, a reconciliation whose form required that it should be brought about within the mind. From the Beyond man was thus called into the presence of spirit, as earth and her bodily objects, human virtues and morality, the individual heart and conscience, began to have some value to him. In the church, if marriage was not held to be immoral, self-restraint and celibacy were considered higher, but now marriage came to be looked on as a divine institution. Then poverty was esteemed better than possession, and to live on alms was considered higher than to support oneself honestly by the work of one's hands; now, however, it becomes known that poverty is not the most moral life, for this last consists in living by one's work and taking pleasure in the fruits thereof. The blind obedience by which human freedom was suppressed, was the third vow taken by the monks, as against which freedom, like marriage and property, was now also recognized as divine. Similarly on the side of knowledge man turned back into himself from the Beyond of authority; and reason was recognized as the absolutely universal, and hence as divine. Now it was perceived that it is in the mind of man that religion must have its place, and the whole process of salvation be gone through — that man's salvation is his own affair, and that by it he enters into relationship with his conscience and into immediate connection with God, requiring no mediation of priests having the so-called means of grace within their hands. There is indeed a mediation present still by means of doctrine, perception,

the observation of self and of one's actions; but that is a mediation without a separating wall, while formerly a brazen wall of division was present separating the laity from the church. It is thus the spirit of God that must dwell within the heart of man, and this indwelling spirit must operate in him.

Although Wycliffe, Huss, and Arnold of Brescia had started from scholastic philosophy with similar ends in view, they did not possess the character requisite to enable them modestly, and without any learned scholastic convictions, to set aside everything but mind and spirit. It was with Luther first of all that freedom of spirit began to exist in embryo, and its form indicated that it would remain in embryo. This beginning of the reconciliation of man with himself, whereby divinity is brought into man's actuality, is thus, at first principle alone. The unfolding of this freedom and the self-reflecting grasp of the same was a subsequent step, in the same way as was the working out of the Christian doctrine in the Church in its time. The subjective thought and knowledge of man, which enables him, being satisfied in his activity, to have joy in his work and to consider his work as something both permissible and justifiable — this value accorded to subjectivity now required a higher confirmation, and the highest confirmation, in order to be made perfectly legitimate, and even to become absolute duty; and to be able to receive this confirmation it had to be taken in its purest form. The mere subjectivity of man, the fact that he has a will, and with it directs his actions this way or that, does not constitute any justification: for else the barbarous will, which fulfils itself in subjective ends alone, such as cannot subsist before reason, would be justified. If, further, self-will obtains the form of universality, if its ends are conformable to reason, and it is apprehended as the freedom of mankind, as legal right which likewise belongs to others, there is therein only indeed the element of

permission, but still there is much in the end being recognized as permitted, and not as absolutely sinful. Art and industry receive through this principle new activity, since now their activity is justified. But we always find the principle of personal spirituality and independence at first limited to particular spheres of objects merely, in accordance with its content. Not until this principle is known and recognized in relation to the absolutely existent object, *i.e.* in relation to God, and is likewise grasped in its perfect purity, free from desires and finite ends, does it receive its highest confirmation, and that is its sanctification through religion.

This, then, is the Lutheran faith, in accordance with which man stands in a relation to God which involves his personal existence: that is, his piety and the hope of his salvation and the like all demand that his heart, his subjectivity, should be present in them. His feelings, his faith, the inmost certainty of himself, in short, all that belongs to him is laid claim to, and this alone can truly come under consideration: man must himself repent from his heart and experience contrition; his own heart must be filled with the Holy Ghost. Thus here the principle of subjectivity, of pure relation to me personally, *i.e.* freedom, is recognized, and not merely so, but it is clearly demanded that in religious worship this alone should be considered. The highest confirmation of the principle is that it alone has value in the eyes of God, that faith and the subjection of the individual heart are alone essential: in this way this principle of Christian freedom is first presented and brought to a true consciousness. Thereby a place has been set apart in the depths of man's inmost nature, in which alone he is at home with himself and at home with God; and with God alone is he really himself, in the conscience he can be said to be at home with himself. This sense of being at home should not be capable of being destroyed through others; no one should presume to have a place therein. All externality in relation to me is thereby banished, just as is the externality of the Host; it is only in

communion and faith that I stand in relation to God. The distinction between the laity and the priests is by it removed; there are no longer any laymen, for in religion each by himself is enjoined to know personally what it is. Responsibility is not to be avoided; good works without spiritual reality in them are no longer of avail; there must be the heart which relates itself directly to God without mediation, without the Virgin, and without the Saints.

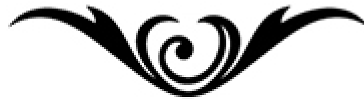
This is the great principle — that all externality disappears in the point of the absolute relation to God; along with this externality, this estrangement of self, all servitude has also disappeared. With it is connected our ceasing to tolerate prayer in foreign tongues, or to study the sciences in such. In speech man is productive; it is the first externality that he gives himself, the simplest form of existence which he reaches in consciousness. What man represents to himself, he inwardly places before himself as spoken. This first form is broken up and rendered foreign if man is in an alien tongue to express or conceive to himself what concerns his highest interest. This breach with the first entrance into consciousness is accordingly removed; to have one's own right to speak and think in one's own language really belongs to liberty. This is of infinite importance, and without this form of being-at-home-with-self subjective freedom could not have existed; Luther could not have accomplished his Reformation without translating the Bible into German. Now the principle of subjectivity has thus become a moment in religion itself, and in this way it has received its absolute recognition, and has been grasped as a whole in the form in which it can only be a moment in religion. The injunction to worship God in spirit is now fulfilled. Spirit, however, is merely conditioned by the free spirituality of the subject. For it is this alone which can be related to spirit; a subject who is not free does not stand in an attitude of spirituality, does not worship God in spirit. This is the general signification of the principle.

Now this principle was at first grasped in relation to religious objects only, and thereby it has indeed received its absolute justification, but still it has not been extended to the further development of the subjective principle itself. Yet in so far as man has come to the consciousness of being reconciled to himself, and of only being able to reconcile himself in his personal existence, he has in his actuality likewise attained another form. The otherwise hearty and vigorous man may also, in as far as he enjoys, do so with a good conscience; the enjoyment of life for its own sake is no longer regarded as something which is to be given up, for monkish renunciation is renounced. But to any other content the principle did not at first extend. Yet further, the religious content has more specially been apprehended as concrete, as it is for the recollection, and into this spiritual freedom the beginning and the possibility of an unspiritual mode of regarding things has thus entered. The content of the *Credo*, speculative as it is in itself, has, that is to say, an historical side. Within this barren form the old faith of the church has been admitted and allowed to exist, so that in this form it has to be regarded by the subject as the highest truth. The result then follows that all development of the dogmatic content in a speculative manner is quite set aside. What was required is man's inward assurance of his deliverance, of his salvation — the relation of the subjective spirit to the absolute, the form of subjectivity as aspiration, repentance, conversion. This new principle has been laid down as paramount, so that the content of truth is clearly of importance; but the teaching respecting the nature and the process of God is grasped in the form in which it at first appears for the ordinary conception. Not only have all this finality, externality, unspirituality, this formalism of scholastic philosophy, been on the one hand discarded, and with justice, but, on the other, the philosophic development of the doctrines of the church has been also set aside, and this is done in connection with the very fact that the subject is immersed in his own heart.

This immersion, his penitence, contrition, conversion, this occupation of the subject with himself, has become the moment of first importance; but the subject has not immersed himself in the content, and the earlier immersion of spirit therein has also been rejected. Even to this present day we shall find in the Catholic Church and in her dogmas the echoes, and so to speak the heritage of the philosophy of the Alexandrian school; in it there is much more that is philosophic and speculative than in the dogmatism of Protestantism, even if there is still in this an objective element, and if it has not been made perfectly barren, as though the content were really retained only in the form of history. The connection of Philosophy with the theology of the Middle Ages has thus in the Catholic Church been retained in its essentials; in Protestantism, on the contrary, the subjective religious principle has been separated from Philosophy, and it is only in Philosophy that it has arisen in its true form again. In this principle the religious content of the Christian Church is thus retained, and it obtains its confirmation through the testimony of spirit that this content shall only hold good for me in as far as it makes its influence felt in my conscience and heart. This is the meaning of the words: "If any man will do his will, he shall know of the doctrine whether it be of God." The criterion of truth is how it is confirmed in my heart; the fact that I judge and know rightly — or that what I hold to be true is the truth — must be revealed to my heart. Truth is what it is in *my* mind; and, on the other hand, my spirit is only then in its proper attitude to truth when truth is within it, when the spirit and its content are related thus. One cannot be isolated from the other. The content has not thus the confirmation in itself which was given to it by philosophical theology in the fact that the speculative Idea made itself therein effectual; neither has it the historic confirmation which is given to a content in so far as it has an outward and historic side in which historic witnesses are heard in evidence, and in which its correctness is determined by their testimony. The doctrine

has to prove itself by the condition of my heart, by penitence, conversion and joy in God. In doctrine we begin with the external content, and thus it is external only; but taken thus, independently of the state of my mind, it properly speaking has no significance. Now this beginning is, as Christian baptism and education, a working upon the nature in addition to an acquaintance with externals. The truth of the gospel and of Christian doctrines only, however, exists in true relation to the same; it is really so to speak a use of the content to make it educative. And this is just what has been said, that the nature is reconstructed and sanctified in itself, and it is this sanctification for which the content is a true one. No further use can be made of the content than to build up and edify the mind, and awaken it to assurance, joy, penitence, conversion. Another and wrong relation to the content is to take it in an external way, *e.g.* according to the great new principle of exegesis, and to treat the writings of the New Testament like those of a Greek, Latin or other author, critically, philologically, historically. Spirit is alone in true relation to spirit; and it is a wrong beginning of a wooden and unyielding exegesis to prove in such an external and philological way the truth of the Christian religion. This has been done by orthodoxy, which thereby renders the content devoid of spirituality. This, then, is the first relation of spirit to this content; here the content is indeed essential, but it is as essential that the holy and sanctifying spirit should bear a relation to it.

This spirit is, however, in the second place really thinking spirit likewise. Thought as such must also develop itself therein, and that really as this form of inmost unity of spirit with itself; thought must come to the distinction and contemplation of this content, and pass over into this form of the purest unity of spirit with itself. At first thought, however, reveals itself as abstract thought alone, and it possesses as such a relation to theology and religion. The content which is here in question, even in so far as it is historic merely



and externally accepted, must yet be religious; the unfolding of the nature of God must be present therein. In this we have the further demand that the thought for which the inward nature of God is, should also set itself in relation to this content. But inasmuch as thought is at first understanding and the metaphysic of the understanding, it will remove from the content the rational Idea and make it so empty that only external history remains, which is devoid of interest.

The third position arrived at is that of concrete speculative thought. According to the standpoint which has just been given, and as religious feeling and its form are here determined, all speculative content as such, as well as its developments, are at first rejected. And as for the enrichment of the Christian conceptions through the treasures of the philosophy of the ancient world, and through the profound ideas of all earlier oriental religions, and the like, — all this is set aside. The content had objectivity; but this merely signified that the objective content, without subsisting for itself, was to constitute the beginning only, on which the mind had spiritually to build up and sanctify itself. All the enrichment of the content whereby it became philosophic, is thus abandoned, and what follows later simply is that the mind, as thinking, again immerses itself in itself, in order to be concrete and rational. What forms the basis of the Reformation is the abstract moment of a mind being within self, of freedom, of coming to self; freedom signifies the life of the spirit in being turned back within itself in the particular content which appears as another; while spirit is not free if it allows this other-being, either unassimilated or dead, to exist in it as something foreign. In as far as spirit now goes on to knowledge, to spiritual determinations, and as it looks around and comes forth as a content, so far will it conduct itself therein as in its own domain, as in its concrete world, so to speak — and it will there really assert and possess its own. This concrete form of knowledge which, however, in the beginning remains but

dim, we have now to consider, and it forms the third period of our treatise, into which we properly step with the Reformation, although Bruno, Vanini and Ramus, who lived later, still belong to the Middle Ages.

PART THREE. MODERN PHILOSOPHY

INTRODUCTION

IF WE CAST a glance back over the period just traversed, we find that in it a turning-point had been reached, that the Christian religion had placed its absolute content in the mind and will of man, and that it was thus, as a divine and supersensuous content, separated from the world and shut up within itself in the centre-point of the individual. Over against the religious life an external world stood as a natural world — a world of heart or feeling, of desire, of human nature — which had value only in as far as it was overcome. This mutual independence of the two worlds had much attention bestowed on it throughout the Middle Ages; the opposition was attacked on all quarters and in the end overcome. But since the relation of mankind to the divine life exists upon earth, this conquest at first presented the appearance of bringing with it the destruction of the church and of the eternal through the sensuous desires of man. The eternal truth was likewise grafted upon the dry, formal understanding, so that we might say that the separation of self-consciousness has in itself disappeared, and thereby a possibility has been given of obtaining reconciliation. But because this implicit union of the Beyond and the Here was of so unsatisfactory a nature that the better feelings were aroused and forced to turn against it, the Reformation made its appearance, partly, no doubt, as a separation from the Catholic Church, but partly as a reformation from within. There is a mistaken idea that the Reformation only effected a separation from the Catholic Church; Luther just as truly reformed the Catholic Church, the corruption of which one learns from his writings, and from the reports of the emperors and of the empire to the Pope; if further evidence be required, we need only read the accounts given even by the Catholic bishops, the

Fathers of the councils at Constance, Basle, &c., of the condition of the Catholic priesthood and of the Roman Court. The principle of the inward reconciliation of spirit, which was in itself the very Idea of Christianity, was thus again estranged, and appeared as a condition of external, unreconciled alienation and discord; this gives us an example of the slow operation of the world-spirit in overcoming this externality. It eats away the inward substance, but the appearance, the outward form, still remains; at the end, however, it is an empty shell, the new form breaks forth. In such times this spirit appears as if it — having so far proceeded in its development at a snail's pace, and having even retrograded and become estranged from itself — had suddenly adopted seven-leagued boots.

Since thus the reconciliation of self-consciousness with the present is implicitly accomplished, man has attained to confidence in himself and in his thought, in sensuous nature outside of and within him; he has discovered an interest and pleasure in making discoveries both in nature and the arts. In the affairs of this world the understanding developed; man became conscious of his will and his achievements, took pleasure in the earth and its soil, as also in his occupations, because right and understanding were there present. With the discovery of gunpowder the individual passion of battle was lost. The romantic impulse towards a casual kind of bravery passed into other adventures, not of hate or revenge, or the so-called deliverance from what men considered the wrongs of innocence, but more harmless adventures, the exploration of the earth, or the discovery of the passage to the East Indies. America was discovered, its treasures and people — nature, man himself; navigation was the higher romance of commerce. The present world was again present to man as worthy of the interests of mind; thinking mind was again capable of action. Now the Reformation of Luther had inevitably to come — the appeal to the *sensus communis* which does not recognize the authority of the Fathers or of Aristotle, but only the inward

personal spirit which quickens and animates, in contradistinction to works. In this way the Church lost her power against it, for her principle was within it and no longer lacking to it. To the finite and present due honour is accorded; from this honour the work of science proceeds. We thus see that the finite, the inward and outward present, becomes a matter of experience, and through the understanding is elevated into universality; men desire to understand laws and forces, *i.e.* to transform the individual of perceptions into the form of universality. Worldly matters demand to be judged of in a worldly way; the judge is thinking understanding. The other side is that the eternal, which is in and for itself true, is also known and comprehended through the pure heart itself; the individual mind appropriates to itself the eternal. This is the Lutheran faith without any other accessories — works, as they were called. Everything had value only as it was grasped by the heart, and not as a mere thing. The content ceases to be an objective thing; God is thus in spirit alone, He is not a beyond but the truest reality of the individual.

Pure thought is likewise one form of inwardness; it also approaches absolute existence and finds itself justified in apprehending the same. The philosophy of modern times proceeds from the principle which ancient philosophy had reached, the standpoint of actual self-consciousness — it has as principle the spirit that is present to itself; it brings the standpoint of the Middle Ages, the diversity between what is thought and the existent universe, into opposition, and it has to do with the dissolution of this same opposition. The main interest hence is, not so much the thinking of the objects in their truth, as the thinking and understanding of the objects, the thinking this unity itself, which is really the being conscious of a presupposed object. The getting rid of the formal culture of the logical understanding and the monstrosities of which it was composed, was more essential than the extension of it: investigation in such a case becomes

dissipated and diffused, and passes into the false infinite. The general points of view which in modern philosophy we reach are hence somewhat as follows: —

1. The concrete form of thought which we have here to consider on its own account, really appears as subjective with the reflection of implicitude, so that this has an antithesis in existence; and the interest is then altogether found in grasping the reconciliation of this opposition in its highest existence, *i.e.* in the most abstract extremes. This highest severance is the opposition between thought and Being, the comprehending of whose unity from this time forward constitutes the interest of all philosophies. Here thought is more independent, and thus we now abandon its unity with theology; it separates itself therefrom, just as with the Greeks it separated itself from mythology, the popular religion, and did not until the time of the Alexandrians seek out these forms again and fill the mythological conceptions with the form of thought. The bond remains, but for this reason it is clearly implicit: theology throughout is merely what philosophy is, for this last is simply thought respecting it. It does not help theology to strive against philosophy, or to say that it wishes to know nothing about it, and that philosophic maxims are thus to be set aside. It has always to do with the thought that it brings along with it, and these its subjective conceptions, its home and private metaphysics, are thus frequently a quite uncultured, uncritical thought — the thought of the street. These general conceptions are, indeed, connected with particular subjective conviction, and this last is said to prove the Christian content to be true in a sense all its own; but these thoughts which constitute the criterion are merely the reflections and opinions which float about the surface of the time. Thus, when thought comes forth on its own account, we thereby separate ourselves from theology; we shall, however, consider one other in whom both are still in unity. This individual is Jacob Boehme, for since mind now moves in its

own domains, it is found partly in the natural and finite world, and partly in the inward, and this at first is the Christian.

While earlier than this, moreover, the spirit, distracted by outward things, had to make its influence felt in religion and in the secular life, and came to be known in the popular philosophy so-called, it was only in the sixteenth and seventeenth centuries that the genuine Philosophy re-appeared, which seeks to grasp the truth as truth because man in thought is infinitely free to comprehend himself and nature, and along with that seeks to understand the present of rationality, reality, universal law itself. For this is ours, since it is subjectivity. The principle of modern philosophy is hence not a free and natural thought, because it has the opposition of thought and nature before it as a fact of which it is conscious. Spirit and nature, thought and Being, are the two infinite sides of the Idea, which can for the first time truly make its appearance when its sides are grasped for themselves in their abstraction and totality. Plato comprehended it as the bond, as limiting and as infinite, as one and many, simple and diverse, but not as thought and Being; when we first thinkingly overcome this opposition it signifies comprehending the unity. This is the standpoint of philosophic consciousness generally; but the way in which this unity must be thinkingly developed is a double one. Philosophy hence falls into the two main forms in which the opposition is resolved, into a realistic and an idealistic system of philosophy, *i.e.* into one which makes objectivity and the content of thought to arise from the perceptions, and one which proceeds to truth from the independence of thought.

a. Experience constitutes the first of these methods, viz. Realism. Philosophy now signified, or had as its main attribute, self-thought and the acceptance of the present as that in which truth lay, and which was thereby knowable. All that is speculative is pared and smoothed down in order to bring it under experience. This present is the existent external nature, and

spiritual activity as the political world and as subjective activity. The way to truth was to begin from this hypothesis, but not to remain with it in its external self-isolating actuality, but to lead it to the universal.

α. The activities of that first method operate, to begin with, on physical nature, from the observation of which men derive universal laws, and on this basis their knowledge is founded; the science of nature, however, only reaches to the stage of reflection. This kind of experimental physics was once called, and is still called philosophy, as Newton's *Principia philosophiæ naturalis* (Vol. I. p. 59) show. This work is one in which the methods of the finite sciences through observation and deduction are alone present — those sciences which the French still call the *sciences exactes*. To this, the understanding of the individual, piety was opposed, and hence in this respect philosophy was termed worldly wisdom (Vol. I. p. 60). Here the Idea in its infinitude is not itself the object of knowledge; but a determinate content is raised into the universal, or this last in its determinateness for the understanding is derived from observation, just as is, for instance, done in Keppler's Laws. In Scholastic philosophy, on the other hand, man's power of observation was set aside, and disputations respecting nature at that time proceeded from abstruse hypotheses.

β. In the second place, the spiritual was observed as in its realization it constitutes the spiritual world of states, in order thus to investigate from experience the rights of individuals as regards one another, and as regards rulers, and the rights of states against states. Before this popes anointed kings, just as was done in Old Testament times to those appointed by God; it was in the Old Testament that the tithe was commanded; the forbidden degrees of relationship in marriage were also adopted from the Mosaic laws. What was right and permissible for kings was demonstrated from Saul's and David's histories, the rights of priesthood from Samuel — in short, the Old Testament was the source of all the principles of public law,

and it is in this way even now that all papal bulls have their deliverances confirmed. It may easily be conceived how much nonsense was in this manner concocted. Now, however, right was sought for in man himself, and in history, and what had been accounted right both in peace and in war was explained. In this way books were composed which even now are constantly quoted in the Parliament of England. Men further observed the desires which could be satisfied in the state and the manner in which satisfaction could be given to them, in order thus from man himself, from man of the past as well as of the present, to learn what is right.

b. The second method, that of Idealism, proceeds from what is inward; according to it everything is in thought, mind itself is all content. Here the Idea itself is made the object; that signifies the thinking it and from it proceeding to the determinate. What Realism draws from experience is now derived from thought *à priori*; or the determinate is also comprehended but not led back to the universal merely, but to the Idea.

The two methods overlap one another, however, because experience on its side desires to derive universal laws from observations, while, on the other side, thought proceeding from abstract universality must still give itself a determinate content; thus *a priori* and *a posteriori* methods are mingled. In France abstract universality was the more predominant; from England experience took its rise, and even now it is there held in the greatest respect; Germany proceeded from the concrete Idea, from the inwardness of mind and spirit.

2. The questions of present philosophy, the opposites, the content which occupies the attention of these modern times, are as follows: —

a. The first form of the opposition which we have already touched upon in the Middle Ages is the Idea of God and His Being, and the task imposed is to deduce the existence of God, as pure spirit, from thought. Both sides

must be comprehended through thought as absolute unity; the extremest opposition is apprehended as gathered into one unity. Other subjects which engage our attention are connected with the same general aim, namely, the bringing about of the inward reconciliation in the opposition which exists between knowledge and its object.

b. The second form of opposition is that of Good and Evil — the opposition of the assertion of independent will to the positive and universal; the origin of evil must be known. Evil is plainly the "other," the negation of God as Holiness; because He is, because He is wise, good, and at the same time almighty, evil is contradictory to Him; an endeavour is made to reconcile this contradiction.

c. The third form of opposition is that of the freedom of man and necessity.

α. The individual is clearly not determined in any other way than from himself, he is the absolute beginning of determination; in the 'I,' in the self, a power of decision is clearly to be found. This freedom is in opposition to the theory that God alone is really absolutely determining. Further, when that which happens is in futurity, the determining of it through God is regarded as Providence and the fore-knowledge of God. In this, however, a new contradiction is involved, inasmuch as because God's knowledge is not merely subjective, that which God knows likewise is.

β. Further still, human freedom is in opposition to necessity as the determinateness of nature; man is dependent on nature, and the external as well as the inward nature of man is his necessity as against his freedom.

γ. Considered objectively, this opposition is that between final causes and efficient causes, *i.e.* between the acts of freedom and the acts of necessity.

δ. This opposition between the freedom of man and natural necessity has finally likewise the further form of community of soul and body, of

commercium animi cum corpore, as it has been called, wherein the soul appears as the simple, ideal, and free, and the body as the manifold, material and necessary.

These matters occupy the attention of science, and they are of a completely different nature from the interests of ancient philosophy. The difference is this, that here there is a consciousness of an opposition, which is certainly likewise contained in the subjects with which the learning of the ancients was occupied, but which had not come to consciousness. This consciousness of the opposition, this 'Fall,' is the main point of interest in the conception of the Christian religion. The bringing about in thought of the reconciliation which is accepted in belief, now constitutes the whole interest of knowledge. Implicitly it has come to pass; for knowledge considers itself qualified to bring about in itself this recognition of the reconciliation. The philosophic systems are therefore no more than modes of this absolute unity, and only the concrete unity of those opposites is the truth.

3. As regards the stages which were reached in the progress of this knowledge we have to mention three of the principal.

a. First of all we find the union of those opposites stated; and to prove it genuine attempts are made, though not yet determined in purity.

b. The second stage is the metaphysical union; and here, with Descartes, the philosophy of modern times as abstract thought properly speaking begins.

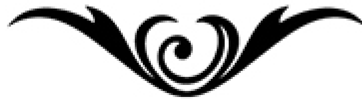
α. Thinking understanding seeks to bring to pass the union, inasmuch as it investigates with its pure thought-determinations; this is in the first place the standpoint of metaphysics as such.

β. In the second place, we have to consider negation, the destruction of this metaphysics — the attempt to consider knowledge on its own account, and the determinations which proceed from it.

c. The third stage is that this union itself which is to be brought about, and which is the only subject of interest, comes to consciousness and becomes an object. As principle the union has the form of the relationship of knowledge to the content, and thus this question has been put: 'How is, and how can thought be identical with the objective?' With this the inward element which lies at the basis of this metaphysic is raised into explicitude and made an object; and this includes all modern philosophy in its range.

4. In respect to the external history and the lives of the philosophers, it will strike us that from this time on, these appear to be very different from those of the philosophers of ancient times, whom we regarded as self-sufficing individualities. It is required that a philosopher should live as he teaches, that he should despise the world and not enter into connection with it; this the ancients have accomplished, and they are such plastic individualities just because the inward spiritual aim of philosophy has likewise frequently determined their external relations and conditions. The object of their knowledge was to take a thoughtful view of the universe; they kept the external connection with the world all the further removed from themselves because they did not greatly approve of much therein present; or, at least, it ever proceeds on its way, according to its own particular laws, on which the individual is dependent. The individual likewise participates in the present interests of external life, in order to satisfy his personal ends, and through them to attain to honour, wealth, respect, and distinction; the ancient philosophers, however, because they remained in the Idea, did not concern themselves with things that were not the objects of their thought. Hence with the Greeks and Romans the philosophers lived in an independent fashion peculiar to themselves, and in an external mode of life which appeared suitable to and worthy of the science they professed; they conducted themselves independently as private

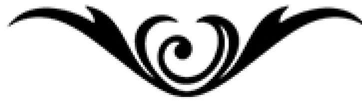
persons, unfettered by outside trammels, and they may be compared to the monks who renounced all temporal goods.



In the Middle Ages it was chiefly the clergy, doctors of theology, who occupied themselves with philosophy. In the transition period the philosophers showed themselves to be in an inward warfare with themselves and in an external warfare with their surroundings, and their lives were spent in a wild, unsettled fashion.

In modern times things are very different; now we no longer see philosophic individuals who constitute a class by themselves. With the present day all difference has disappeared; philosophers are not monks, for we find them generally in connection with the world, participating with others in some common work or calling. They live, not independently, but in the relation of citizens, or they occupy public offices and take part in the life of the state. Certainly they may be private persons, but if so, their position as such does not in any way isolate them from their other relationships. They are involved in present conditions, in the world and its work and progress. Thus their philosophy is only by the way, a sort of luxury and superfluity. This difference is really to be found in the manner in which outward conditions have taken shape after the building up of the inward world of religion. In modern times, namely, on account of the reconciliation of the worldly principle with itself, the external world is at rest, is brought into order — worldly relationships, conditions, modes of life, have become constituted and organized in a manner which is conformable to nature and rational. We see a universal, comprehensible connection, and with that individuality likewise attains another character and nature, for it is no longer the plastic individuality of the ancients. This connection is of such power that every individuality is under its dominion, and yet at the same time can construct for itself an inward world. The external has thus been reconciled with itself in such a way that both inward

and outward may be self-sufficing and remain independent of one another; and the individual is in the condition of being able to leave his external side to external order, while in the case of those plastic forms the external could only be determined entirely from within. Now, on the contrary, with the higher degree of strength attained by the inward side of the individual, he may hand the external over to chance; just as he leaves clothing to the contingencies of fashion, not considering it worth while to exert his understanding upon it. The external he leaves to be determined by the order which is present in the particular sphere in which his lot is cast. The circumstances of life are, in the true sense, private affairs, determined by outward conditions, and do not contain anything worthy of our notice. Life becomes scholarly, uniform, commonplace, it connects itself with outwardly given relationships and cannot represent or set itself forth as a form pertaining only to itself. Man must not take up the character of showing himself an independent form, and giving himself a position in the world created by himself. Because the objective power of external relationships is infinitely great, and for that reason the way in which I perforce am placed in them has become a matter of indifference to me, personality and the individual life generally are equally indifferent. A philosopher, it is said, should live as a philosopher, *i.e.*, should be independent of the external relationships of the world, and should give up occupying himself with and troubling himself concerning them. But thus circumscribed in respect of all necessities, more especially of culture, no one can suffice for himself; he must seek to act in connection with others. The modern world is this essential power of connection, and it implies the fact that it is clearly necessary for the individual to enter into these relations of external existence; only a common mode of existence is possible in any calling or condition, and to this Spinoza forms the solitary exception. Thus in earlier times bravery was individual; while modern bravery consists in



each not acting after his own fashion, but relying on his connection with others — and this constitutes his whole merit. The calling of philosopher is not, like that of the monks, an organized condition. Members of academies of learning are no doubt organized in part, but even a special calling like theirs sinks into the ordinary commonplace of state or class relationships, because admission thereinto is outwardly determined. The real matter is to remain faithful to one's aims.

SECTION ONE. Modern Philosophy in its First Statement

THE FIRST TWO philosophers whom we have to consider are Bacon and Boehme; there is as complete a disparity between these individuals as between their systems of philosophy. None the less both agree that mind operates in the content of its knowledge as in its own domain, and this consequently appears as concrete Being. This domain in Bacon is the finite, natural world; in Boehme it is the inward, mystical, godly Christian life and existence; for the former starts from experience and induction, the latter from God and the pantheism of the Trinity.

A. Bacon.

THERE WAS ALREADY being accomplished the abandonment of the content which lies beyond us, and which through its form has lost the merit it possessed of being true, and is become of no significance to self-consciousness or the certainty of self and of its actuality; this we see for the first time consciously expressed, though not as yet in a very perfect form, by Francis Bacon, Baron Verulam, Viscount St. Albans. He is therefore instanced as in the fore-front of all this empirical philosophy, and even now our countrymen like to adorn their works with sententious sayings culled from him. Baconian philosophy thus usually means a philosophy which is founded on the observation of the external or spiritual nature of man in his inclinations, desires, rational and judicial qualities. From these conclusions are drawn, and general conceptions, laws pertaining to this domain, are thus discovered. Bacon has entirely set aside and rejected the scholastic method of reasoning from remote abstractions and being blind to what lies before one's eyes. He takes as his standpoint the sensuous manifestation as it appears to the cultured man, as the latter reflects upon it; and this is conformable to the principle of accepting the finite and worldly as such.

Bacon was born in London in 1561. His progenitors and relatives held high office in the state, and his father was Keeper of the Great Seal to Queen Elizabeth. He in his turn, having been educated to follow the same vocation, at once devoted himself to the business of the state, and entered upon an important career. He early displayed great talent, and at the age of nineteen he produced a work on the condition of Europe (*De statu Europæ*). Bacon in his youth attached himself to the Earl of Essex, the favourite of Elizabeth, through whose support he, who as a younger son had to see his

paternal estate pass to his elder brother, soon attained to better circumstances, and was elevated to a higher position. Bacon, however, sullied his fame by the utmost ingratitude and faithlessness towards his protector; for he is accused of having been prevailed upon by the enemies of the Earl after his fall to charge him publicly with High Treason. Under James I., the father of Charles I. who was beheaded, a weak man, to whom he recommended himself by his work *De augmentis scientiarum*, he received the most honourable offices of state by attaching himself to Buckingham: he was made Keeper of the Great Seal, Lord Chancellor of England, Baron Verulam. He likewise made a rich marriage, though he soon squandered all his means, and high though his position was, he stooped to intrigues and was guilty of accepting bribes in the most barefaced manner. Thereby he brought upon himself the ill-will both of people and of nobles, so that he was prosecuted, and his case was tried before Parliament. He was fined 40,000*l.*, thrown into the Tower, and his name was struck out of the list of peers; during the trial and while he was in prison he showed the greatest weakness of character. He was, however, liberated from prison, and his trial was annulled, owing to the even greater hatred of the king and his minister Buckingham, under whose administration Bacon had filled these offices, and whose victim he appeared to have been; for he fell earlier than his comrade Buckingham, and was deserted and condemned by him. It was not so much his innocence as the fact that those who ruined him had made themselves hated to an equal degree through their rule, that caused the hatred and indignation against Bacon to be somewhat mitigated. But he neither recovered his own sense of self-respect nor the personal esteem of others, which he had lost through his former conduct. He retired into private life, lived in poverty, had to beg sustenance from the king, occupied himself during the remainder of his life with science only, and died in 1626.[95]

Since Bacon has ever been esteemed as the man who directed knowledge to its true source, to experience, he is, in fact, the special leader and representative of what is in England called Philosophy, and beyond which the English have not yet advanced. For they appear to constitute that people in Europe which, limited to the understanding of actuality, is destined, like the class of shopkeepers and workmen in the State, to live always immersed in matter, and to have actuality but not reason as object. Bacon won great praise by showing how attention is to be paid to the outward and inward manifestations of Nature, and the esteem in which his name is thus held is greater than can be ascribed directly to his merit. It has become the universal tendency of the time and of the English mode of reasoning, to proceed from facts, and to judge in accordance with them. Because Bacon gave expression to the tendency, and men require to have a leader and originator for any particular manner of thinking, he is credited with having given to knowledge this impulse towards experimental philosophy generally. But many cultured men have spoken and thought regarding what concerns and interests mankind, regarding state affairs, mind, heart, external nature, &c., in accordance with experience and in accordance with a cultured knowledge of the world. Bacon was just such a cultured man of the world, who had seen life in its great relations, had engaged in state affairs, had dealt practically with actual life, had observed men, their circumstances and relations, and had worked with them as cultured, reflecting, and, we may even say, philosophical men of the world. He thus did not escape the corruption of those who stood at the helm of the state. With all the depravity of his character he was a man of mind and clear perception; he did not, however, possess the power of reasoning through thoughts and notions that are universal. We do not find in him a methodical or scientific manner of regarding things, but only the external reasoning of a man of the world. Knowledge of the world he possessed in the highest degree: “rich

imagination, powerful wit, and the penetrating wisdom which he displays upon that most interesting of all subjects, commonly called the world. This last appears to us to have been the characteristical quality of Bacon's genius.... It was men rather than things that he had studied, the mistakes of philosophers rather than the errors of philosophy. In fact he was no lover of abstract reasoning," and although it pertains to philosophy, we find as little as possible of it in him. "His writings are indeed full of refined and most acute observations, but it seldom requires any effort on our part to apprehend their wisdom." Hence mottoes are often derived from him. "His judgments," however, "are commonly given *ex cathedra*, or, if he endeavours to elucidate them, it is by similes and illustrations and pointed animadversions more than by direct and appropriate arguments. General reasoning is absolutely essential in philosophy; the want of it is marked in Bacon's writings."[96] His practical writings are specially interesting; but we do not find the bright flashes of genius that we expected. As during his career in the state he acted in accordance with practical utility, he now, at its conclusion, likewise applied himself in a practical way to scientific endeavours, and considered and treated the sciences in accordance with concrete experience and investigation. His is a consideration of the present, he makes the most of, and ascribes value to it as it appears; the existent is thus regarded with open eyes, respect is paid to it as to what reigns pre-eminent, and this sensuous perception is reverenced and recognized. Here a confidence on the part of reason in itself and in nature is awakened; it thinkingly applies itself to nature, certain of finding the truth in it, since both are in themselves harmonious.

Bacon likewise treated the sciences methodically; he did not merely bring forward opinions and sentiments, he did not merely express himself regarding the sciences dogmatically, as a fine gentleman might, but he went into the matter closely, and established a method in respect of scientific

knowledge. It is only through this method of investigation introduced by him that he is noteworthy — it is in that way alone that he can be considered to belong to the history of the sciences and of philosophy. And through this principle of methodical knowledge he has likewise produced a great effect upon his times, by drawing attention to what was lacking in the sciences, both in their methods and in their content. He set forth the general principles of procedure in an empirical philosophy. The spirit of the philosophy of Bacon is to take experience as the true and only source of knowledge, and then to regulate the thought concerning it. Knowledge from experience stands in opposition to knowledge arising from the speculative Notion, and the opposition is apprehended in so acute a manner that the knowledge proceeding from the Notion is ashamed of the knowledge from experience, just as this again takes up a position of antagonism to the knowledge through the Notion. What Cicero says of Socrates may be said of Bacon, that he brought Philosophy down to the world, to the homes and every-day lives of men (Vol. I. p. 389). To a certain extent knowledge from the absolute Notion may assume an air of superiority over this knowledge; but it is essential, as far as the Idea is concerned, that the particularity of the content should be developed. The Notion is an essential matter, but as such its finite side is just as essential. Mind gives presence, external existence, to itself; to come to understand this extension, the world as it is, the sensuous universe, to understand itself as this, *i.e.* with its manifest, sensuous extension, is one side of things. The other side is the relation to the Idea. Abstraction in and for itself must determine and particularize itself. The Idea is concrete, self-determining, it has the principle of development; and perfect knowledge is always developed. A conditional knowledge in respect of the Idea merely signifies that the working out of the development has not yet advanced very far. But we have to deal with this development; and for this development and determination of the particular from the Idea, so that

the knowledge of the universe, of nature, may be cultivated — for this, the knowledge of the particular is necessary. This particularity must be worked out on its own account; we must become acquainted with empirical nature, both with the physical and with the human. The merit of modern times is to have accomplished or furthered these ends; it was in the highest degree unsatisfactory when the ancients attempted the work. Empiricism is not merely an observing, hearing, feeling, etc., a perception of the individual; for it really sets to work to find the species, the universal, to discover laws. Now because it does this, it comes within the territory of the Notion — it begets what pertains to the region of the Idea; it thus prepares the empirical material for the Notion, so that the latter can then receive it ready for its use. If the science is perfected the Idea must certainly issue forth of itself; science as such no longer commences from the empiric. But in order that this science may come into existence, we must have the progression from the individual and particular to the universal — an activity which is a reaction on the given material of empiricism in order to bring about its reconstruction. The demand of *a priori* knowledge, which seems to imply that the Idea should construct from itself, is thus a reconstruction only, or what is in religion accomplished through sentiment and feeling. Without the working out of the empirical sciences on their own account, Philosophy could not have reached further than with the ancients. The whole of the Idea in itself is science as perfected and complete; but the other side is the beginning, the process of its origination. This process of the origination of science is different from its process in itself when it is complete, just as is the process of the history of Philosophy and that of Philosophy itself. In every science principles are commenced with; at the first these are the results of the particular, but if the science is completed they are made the beginning. The case is similar with Philosophy; the working out of the empirical side has really become the conditioning of the Idea, so that this

last may reach its full development and determination. For instance, in order that the history of the Philosophy of modern times may exist, we must have a history of Philosophy in general, the process of Philosophy during so many thousand years; mind must have followed this long road in order that the Philosophy may be produced. In consciousness it then adopts the attitude of having cut away the bridge from behind it; it appears to be free to launch forth in its ether only, and to develop without resistance in this medium; but it is another matter to attain to this ether and to development in it. We must not overlook the fact that Philosophy would not have come into existence without this process, for mind is essentially a working upon something different.

1. Bacon's fame rests on two works. In the first place, he has the merit of having in his work *De augmentis scientiarum* presented to us a systematic encyclopedia of the sciences, an outline which must undoubtedly have caused a sensation amongst his contemporaries. It is important to set before men's eyes a well arranged picture such as this of the whole, when that whole has not been grasped in thought. This encyclopedia gives a general classification of the sciences; the principles of the classification are regulated in accordance with the differences in the intellectual capacities. Bacon thus divides human learning according to the faculties of memory, imagination, and reason, for he distinguishes what pertains (1) to memory; (2) to imagination; (3) to reason. Under memory he considered history; under imagination, poetry, and art; and finally, under reason, philosophy.[97] According to his favourite method of division these again are further divided, since he brings all else under these same heads; this is, however, unsatisfactory. To history belong the works of God — sacred, prophetic, ecclesiastical history; the works of men — civil and literary history; and likewise the works of nature, and so on.[98] He goes through these topics after the manner of his time, a main characteristic of which is that anything can

be made plausible through examples, *e.g.* from the Bible. Thus, in treating of *Cosmetica*, he says in regard to paint that "He is surprised that this depraved custom of painting has been by the penal laws both ecclesiastical and civil so long overlooked. In the Bible we read indeed of Jezebel that she painted her face; but nothing of the kind is said of Esther or Judith."[99] If kings, popes, etc., are being discussed, such examples as those of Ahab and Solomon must be brought forward. As formerly in civil laws — those respecting marriage, for instance — the Jewish forms held good, in Philosophy, too, the same are still to be found. In this work theology likewise appears, as also magic; there is contained in it a comprehensive system of knowledge and of the sciences.

The arrangement of the sciences is the least significant part of the work *De augmentis scientiarum*. It was by its criticism that its value was established and its effect produced, as also by the number of instructive remarks contained in it; all this was at that time lacking in the particular varieties of learning and modes of discipline, especially in as far as the methods hitherto adopted were faulty, and unsuitable to the ends in view: in them the Aristotelian conceptions of the schools were spun out by the understanding as though they were realities. As it was with the Schoolmen and with the ancients, this classification is still the mode adopted in the sciences, in which the nature of knowledge is unknown. In them the idea of the science is advanced beforehand, and to this idea a principle foreign to it is added, as a basis of division, just as here is added the distinction between memory, imagination and reason. The true method of division is found in the self-division of the Notion, its separating itself from itself. In knowledge the moment of self-consciousness is undoubtedly found, and the real self-consciousness has in it the moments of memory, imagination and reason. But this division is certainly not taken from the Notion of self-

consciousness, but from experience, in which self-consciousness finds itself possessed of these capacities.

2. The other remarkable feature in Bacon is that in his second work, his *Organon*, he sought at great length to establish a new method in learning; in this regard his name is still held greatly in honour by many. What chiefly distinguishes his system is his polemical attitude towards scholastic methods as they had hitherto existed, towards syllogistic forms. He calls these methods *anticipationes naturæ*; in them men begin with presuppositions, definitions, accepted ideas, with a scholastic abstraction, and reason further from these without regarding that which is present in actuality. Thus regarding God and His methods of operating in nature, regarding devils, &c., they make use of passages from the Bible, such as "Sun, stand thou still," in order to deduce therefrom certain metaphysical propositions from which they go further still. It was against this *a priori* method that Bacon directed his polemic; as against these anticipations of nature he called attention to the explanation, the interpretation of nature.[100] "The same action of mind," he says, "which discovers a thing in question, judges it; and the operation is not performed by the help of any middle term, but directly, almost in the same manner as by the sense. For the sense in its primary objects at once apprehends the appearance of the object, and consents to the truth thereof."[101] The syllogism is altogether rejected by Bacon. As a matter of fact, this Aristotelian deduction is not a knowledge through itself in accordance with its content: it requires a foreign universal as its basis, and for that reason its movement is in its form contingent. The content is not in unity with the form, and this form is hence in itself contingent, because it, considered on its own account, is the movement onwards in a foreign content. The major premise is the content existent for itself, the minor is likewise the content not through itself, for it goes back into the infinite, *i.e.* it has not the form in itself; the form is not the content.

The opposite may always be made out equally well through the syllogism, for it is a matter of indifference to this form what content is made its basis. “Dialectic does not assist in the discovery of the arts; many arts were found out by chance.”[102]

It was not against this syllogism generally, *i.e.* not against the Notion of it (for Bacon did not possess this), but against deduction as it was put into operation, as it was to the scholastics — the deduction which took an assumed content as its basis — that Bacon declaimed, urging that the content of experience should be made the basis, and the method of induction pursued. He demanded that observations on nature and experiments should be made fundamental, and pointed out the objects whose investigation was of special importance in the interests of human society, and so on. From this there then resulted the establishment of conclusions through induction and analogy.[103] In fact it was only to an alteration in the content that, without being aware of it, Bacon was impelled. For though he rejected the syllogism and only permitted conclusions to be reached through induction, he unconsciously himself drew deductions; likewise all these champions of empiricism, who followed after him, and who put into practice what he demanded, and thought they could by observations, experiments and experiences, keep the matter in question pure, could neither so do without drawing deductions, nor without introducing conceptions; and they drew their deductions and formed their notions and conceptions all the more freely because they thought that they had nothing to do with conceptions at all; nor did they go forth from deduction to immanent, true knowledge. Thus when Bacon set up induction in opposition to the syllogism, this opposition is formal; each induction is also a deduction, which fact was known even to Aristotle. For if a universal is deduced from a number of things, the first proposition reads, “These bodies have these qualities;” the second, “All these bodies belong to one

class;” and thus, in the third place, this class has these qualities. That is a perfect syllogism. Induction always signifies that observations are instituted, experiments made, experience regarded, and from this the universal determination is derived.

We have already called to mind how important it is to lead on to the content as the content of actuality, of the present; for the rational must have objective truth. The reconciliation of spirit with the world, the glorification of nature and of all actuality, must not be a Beyond, a Futurity, but must be accomplished now and here. It is this moment of the now and here which thereby comes into self-consciousness. But those who make experiments and observations, do not realize what they are really doing, for the sole interest taken by them in things, is owing to the inward and unconscious certainty which reason has of finding itself in actuality; and observations and experiments, if entered upon in a right way, result in showing that the Notion is the only objective existence. The sensuous individual eludes the experiments even while it is being operated upon, and becomes a universal; the best known example of this is to be found in positive and negative electricity in so far as it is positive and negative. There is another shortcoming of a formal nature, and one of which all empiricists partake, — that is that they believe themselves to be keeping to experience alone; it is to them an unknown fact that in receiving these perceptions they are indulging in metaphysics. Man does not stop short at the individual, nor can he do so. He seeks the universal, but thoughts, even if not Notions likewise, are what constitute the same. The most remarkable thought-form is that of force; we thus speak of the force of electricity, of magnetism, of gravity. Force, however, is a universal and not a perceptible; quite uncritically and unconsciously the empiricists thus permit of determinations such as these.

3. Bacon finally gives the objects with which Philosophy mainly has to deal. These objects contrast much with that which we derive from

perception and experience. “In the summary which Bacon gives of what he conceives ought to be the objects of philosophical inquiry, are the following; and we select those which he principally dwells upon in his works: ‘The prolongation of life; the restitution of youth in some degree; the retardation of old age, and the altering of statures; the altering of features; versions of bodies into other bodies; making of new species; impression of the air and raising tempests; greater pleasures of the senses, &c.’” He likewise deals with objects such as these, and he seeks to direct attention upon whether in their regard the means could not be found to carry out their ends; in such powers we should be able to make some progress. “He complains that such investigations have been neglected by those whom he designates *ignavi regionum exploratores*. In his Natural History he gives formal receipts for making gold, and performing many wonders.”[104] Bacon thus does not by any means take the intelligent standpoint of an investigation of nature, being still involved in the grossest superstition, false magic, &c. This we find to be on the whole propounded in an intelligent way, and Bacon thus remains within the conceptions of his time. “The conversion of silver, quicksilver, or any other metal into gold is a thing difficult to believe, yet it is far more probable that a man who knows clearly the natures of weight, of the colour of yellow, of malleability and extension, of volatility and fixedness, and who has also made diligent search into the first seeds and menstruums of minerals, may at last by much and sagacious endeavour produce gold, than that a few grains of an elixir may so do.... So again a man who knows well the nature of rarefaction, of assimilation, and of alimentation, shall by diets, bathings, and the like prolong life, or in some degree renew the vigour of youth.”[105] These assertions are thus not as crude as they at first appear. In dealing with Medicine Bacon speaks amongst other things of maceration (*Malacissatio per exterius*)[106] and so forth.

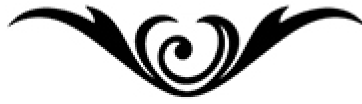
Bacon emphasizes what has reference to the formal aspect of investigation. For he says, “Natural philosophy is divided into two parts, the first consists in the investigation of causes; the second in the production of effects; the causes to be investigated are either final or formal causes, or else material or efficient causes. The former constitutes metaphysics; the latter physics. This last Bacon looks upon as a branch of philosophy very inferior in point of dignity and importance to the other and accordingly to ascertain the most probable means of improving our knowledge of metaphysics is the great object of his *Organon*.”[107] He himself says: “It is a correct position that ‘true knowledge is knowledge by causes. And causes, again, are not improperly distributed into four kinds: the material, the formal, the efficient, and the final.’”[108] (Vol. I. p. 174, Vol. II. p. 138.)

But in this connection an important point is that Bacon has turned against the teleological investigation of nature, against the investigation into final causes. “The investigation of final causes is useless; they corrupt rather than advance the sciences except such as have to do with human action.”[109] To Bacon the important matter is to investigate by the study of *causæ efficientes*. To the consideration of final causes such assertions as these belong: “That the hairs of the eyelids are for a protection to the eyes; that the thick skins and hides of living creatures are to defend them from heat and cold; that the trees have leaves so that the fruit may not suffer from sun and wind”[110]: the hair is on the head on account of warmth; thunder and lightning are the punishment of God, or else they make fruitful the earth; marmots sleep during the winter because they can find nothing to eat; snails have a shell in order that they may be secure against attacks; the bee is provided with a sting. According to Bacon this has been worked out in innumerable different ways. The negative and external side of utility is turned round, and the lack of this adaptation to end is likewise drawn within the same embrace. It may, for example, be said that if sun or moon were to

shine at all times, the police might save much money, and this would provide men with food and drink for whole months together. It was right that Bacon should set himself to oppose this investigation into final causes, because it relates to external expediency, just as Kant was right in distinguishing the inward teleology from the outward. As against the external end, there is, in fact, the inward end, *i.e.* the inward Notion of the thing itself, as we found it earlier in Aristotle (Vol. II. pp. 156-163). Because the organism possesses an inward adaptation to its ends, its members are indeed likewise externally adapted as regards one another; but the ends, as external ends, are heterogeneous to the individual, are unconnected with the object which is investigated. Speaking generally, the Notion of nature is not in nature itself, which would mean that the end was in nature itself; but as teleological, the Notion is something foreign to it. It does not have the end in itself in such a way that we have to accord respect to it — as the individual man has his end in himself and hence has to be respected. But even the individual man as individual has only a right to respect from the individual as such, and not from the universal. He who acts in the name of the universal, of the state, as a general does for instance, does not require to respect the individual at all; for the latter, although an end in himself, does not cease to be relative. He is this end in himself, not as excluding himself and setting himself in opposition, but only in so far as his true reality is the universal Notion. The end of the animal in itself as an individual is its own self-preservation; but its true end in itself is the species. Its self-preservation is not involved in this; for the self-preservation of its individuality is disadvantageous to the species, while the abrogation of itself is favourable thereto.

Now Bacon separates the universal principle and the efficient cause, and for that reason he removes investigation into ends from physics to metaphysics. Or he recognizes the Notion, not as universal in nature, but

only as necessity, *i.e.* as a universal which presents itself in the opposition of its moments, not one which has bound them into a unity — in other words he only acknowledges a comprehension of one determinate from another determinate going on into infinity, and not of both from their Notion. Bacon has thus made investigation into the efficient cause more general, and he asserts that this investigation alone belongs to physics, although he allows that both kinds of investigation may exist side by side.[111] Through that view he effected a great deal, and in so far as it has counteracted the senseless superstition which in the Germanic nations far exceeded in its horrors and absurdity that of the ancient world, it has the very merit which we met with in the Epicurean philosophy. That philosophy opposed itself to the superstitious Stoics and to superstition generally — which last makes any existence that we set before ourselves into a cause (a Beyond which is made to exist in a sensuous way and to operate as a cause), or makes two sensuous things which have no relation operate on one another. This polemic of Bacon's against spectres, astrology, magic, &c.,[112] can certainly not be regarded exactly as Philosophy like his other reflections, but it is at least of service to culture.



He also advises that attention should be directed to formal causes, the forms of things, and that they should be recognized.[113] "But to give an exact definition of the meaning which Bacon attaches to the phrase formal causes is rather difficult; because his language upon this subject is uncertain in a very remarkable degree."[114] It may be thought that he understood by this the immanent determinations of things, the laws of nature; as a matter of fact the forms are none else than universal determinations, species, &c.[115] He says: "The discovery of the formal is despaired of. The efficient and the material (as they are investigated and received, that is as remote causes, without reference to the latent process leading to the forms) are but slight and superficial, and contribute little, if anything, to true and active science.

For though in nature nothing really exists beside individual bodies, performing pure individual acts according to a fixed law, yet in philosophy this very law, and the investigation, discovery and explanation of it, is the foundation as well of knowledge as of operation. And it is this law, with its clauses, that I mean when I speak of Forms.... Let the investigation of Forms which are eternal and immutable constitute metaphysics. Whosoever is acquainted with Forms embraces the unity of nature in substances the most unlike."[116] He goes through this in detail, and quotes many examples to illustrate it, such as that of Heat. "Mind must raise itself from differences to species. The warmth of the sun and that of the fire are diverse. We see that grapes ripen by the warmth of the sun. But to see whether the warmth of the sun is specific, we also observe other warmth, and we find that grapes likewise ripen in a warm room; this proves that the warmth of the sun is not specific."[117]

"Physic," he says, "directs us through narrow rugged paths in imitation of the crooked ways of nature. But he that understands a form knows the ultimate possibility of superinducing that nature upon all kinds of matter; that is to say, as he himself interprets this last expression, is able to superinduce the nature of gold upon silver," that is to say to make gold from silver, "and to perform all those other marvels to which the alchymists pretended. The error of these last consisted alone in hoping to arrive at these ends by fabulous and fantastical methods;" the true method is to recognize these forms. "One leading object of the *Instauratio Magna* and of the *Novum Organon* is to point out the necessity of ascertaining the formal causes and logical rules."[118] They are good rules, but not adapted to attain that end.

This is all that we have to say of Bacon. In dealing with Locke we shall have more to say of these empirical methods which were adopted by the English.

B. Jacob Boehme.

We now pass on from this English Lord Chancellor, the leader of the external, sensuous method in Philosophy, to the *philosophus teutonicus*, as he is called — to the German cobbler of Lusatia, of whom we have no reason to be ashamed. It was, in fact, through him that Philosophy first appeared in Germany with a character peculiar to itself: Boehme stands in exact antithesis to Bacon. He was also called *theosophus teutonicus*, just as even before this *philosophia teutonica* was the name given to mysticism.[119] This Jacob Boehme was for long forgotten and decried as being simply a pious visionary; the so-called period of enlightenment, more particularly, helped to render his public extremely limited. Leibnitz thought very highly of him, but it is in modern times that his profundity has for the first time been recognized, and that he has been once more restored to honour. It is certain, on the one hand, that he did not merit the disdain accorded him; on the other, however, he did not deserve the high honour into which he was elevated. To call him an enthusiast signifies nothing at all. For if we will, all philosophers may be so termed, even the Epicureans and Bacon; for they all have held that man finds his truth in something else than eating and drinking, or in the common-sense every-day life of wood-cutting, tailoring, trading, or other business, private or official. But Boehme has to attribute the high honour to which he was raised mainly to the garb of sensuous feeling and perception which he adopted; for ordinary sensuous perception and inward feeling, praying and yearning, and the pictorial element in thought, allegories and such like, are in some measure held to be essential in Philosophy. But it is only in the Notion, in thought, that Philosophy can find its truth, and that the Absolute can be expressed and likewise is as it is

in itself. Looked at from this point of view, Boehme is a complete barbarian, and yet he is a man who, along with his rude method of presentation, possesses a deep, concrete heart. But because no method or order is to be found in him, it is difficult to give an account of his philosophy.

Jacob Boehme was born in 1575 of poor parents, at Altseidenburg, near Görlitz, in Upper Lusatia. In his youth he was a peasant boy who tended the cattle. He was brought up as a Lutheran, and always remained such. The account of his life which is given with his works was drawn up by a clergyman who knew him personally, from information given by Boehme himself. Much is there related as to how he attained to more profound knowledge and wisdom by means of certain experiences through which he passed. Even when a herd tending the cattle, as he tells of himself, he had these wonderful manifestations. The first marvellous awakening that occurred to him took place in a thicket in which he saw a cavern and a vessel of gold. Startled by the splendour of this sight he was inwardly awakened from a dull stupor, but afterwards he found it was impossible for him to discover the objects of his vision. Subsequently he was bound apprentice to a shoemaker. More especially "was he spiritually awakened by the words: 'Your heavenly Father will give the Holy Spirit to them that ask Him' (Luke xi. 13), so that, desiring to come to a knowledge of the truth, and yet retaining the simplicity of his mind, he prayed and sought, and knocked, fervently and earnestly, until, while travelling about with his master, he was, through the influence of the Father in the Son, spiritually transported into the glorious peace and the Sabbath of the soul, and thus his request was granted. According to his own account, he was then surrounded with divine light, and for seven days he remained in the supremest divine contemplation and joy." His master for this dismissed him, saying he could not keep in his service "house-prophets such as he was." After that he lived

at Görlitz. In 1594 he rose in his trade to be master, and married. Later on, "in the year 1600, and in the twenty-fifth year of his age, once more" the light broke upon him in a second vision of the same kind. He tells that he saw a brightly scoured pewter dish in the room, and "by the sudden sight of this shining metal with its brilliant radiance" he was brought (into a meditation and a breaking free of his astral mind) "into the central point of secret nature," and into the light of divine essence. "He went out into the open air in order that he might rid his brain of this hallucination, and none the less did he continue all the more clearly as time went on to experience the vision in this way received. Thus by means of the signatures or figures, lineaments, and colours which were depicted, he could, so to speak, look into the heart and inmost nature of all creatures (in his book *De signatura rerum* this reason which was impressed upon him is found and fully explained); and for this he was overwhelmed with joy, thanked God, and went peacefully about his affairs." Later on he wrote several works. He continued to pursue his handicraft at Görlitz, and died at the same place in 1624, being then a master shoemaker.[120]

His works are especially popular with the Dutch, and for that reason most of the editions are issued from Amsterdam, though they were also surreptitiously printed in Hamburg. His first writing is the "Aurora" or "Morgenröthe im Aufgange," and this was followed by others; the work "Von den drei Principien," and another "Vom dreifachen Leben des Menschen," are, along with several others, the most noteworthy. Boehme constantly read the Bible, but what other works he read is not known. A number of passages in his works, however, prove that he read much — evidently mystical, theosophic, and alchemistic writings for the most part, and he must certainly have included in his reading the works of Theophrastus Bombastus von Hohenheim, known as Paracelsus, a philosopher of a somewhat similar calibre, but much more confused, and

without Boehme's profundity of mind. He met with much persecution at the hands of the clergy, but he aroused less attention in Germany than in Holland and England, where his writings have been often printed.[121] In reading his works we are struck with wonder, and one must be familiar with his ideas in order to discover the truth in this most confused method of expression.

The matter of Jacob Boehme's philosophy is genuinely German; for what marks him out and makes him noteworthy is the Protestant principle already mentioned of placing the intellectual world within one's own mind and heart, and of experiencing and knowing and feeling in one's own self-consciousness all that formerly was conceived as a Beyond. Boehme's general conceptions thus on the one hand reveal themselves as both deep and sound, but on the other, with all his need for and struggle after determination and distinction in the development of his divine intuitions of the universe, he does not attain either to clearness or order. There is no systematic connection but the greatest confusion in his divisions — and this exists even in his tables,[122] in which three numbers are made use of.

I.

What God is beside nature and creation.

II.

Separability: God in Love.	*Mysterium magnum.*	The first *Principium*. God in Wrath.

III.

God in wrath and love.

Here nothing definite to hold the moments asunder is shown, and we have the sense of merely doing it by effort; now these and now other distinctions are set forth, and as they are laid down disconnectedly, they again come into confusion.

The manner and system which Boehme adopts must accordingly be termed barbarous; the expressions used in his works prove this, as when, for example, he speaks of the divine Salitter, Marcurius, &c. As Boehme places the life, the movement of absolute existence in the heart, so does he regard all conceptions as being in a condition of actuality; or he makes use of actuality as Notion, that is to say he forcibly takes natural things and sensuous qualities to express his ideas rather than the determinations of the Notion. For instance, sulphur and such like are not to him the things that we so name, but their essence; or the Notion has this form of actuality. Boehme's profoundest interest is in the Idea, and he struggles hard to express it. The speculative truth which he desires to expound really requires, in order to be comprehended, thought and the form of thought. Only in thought can this unity be comprehended, in the central point of which his mind has its place; but it is just the form of thought that is lacking to him. The forms that he employs are really no longer determinations of the Notion at all. They are on the one hand sensuous, chemical determinations, such qualities as acid, sweet, sour, fierce, and, on the other, emotions such as wrath and love; and, further, tincture, essence, anguish, &c. For him these sensuous forms do not, however, possess the sensuous significance which belongs to them, but he uses them in order to find expression for his thought. It is, however, at once clear to us how the form of manifestation must necessarily appear forced, since thought alone is capable of unity. It thus appears strange to read of the bitterness of God, of the *Flagrat*, and of lightning; we first require to have the Idea, and then we certainly discern its presence here. But the other side is that Boehme utilizes

the Christian form which lies nearest to him, and more especially that of the Trinity, as the form of the Idea: he intermingles the sensuous mode and the mode of popularly conceived religion, sensuous images and conceptions. However rude and barbarous this may on the one hand be, and however impossible it is to read Boehme continuously, or to take a firm grasp of his thoughts (for all these qualities, spirits and angels make one's head swim), we must on the other hand recognize that he speaks of everything as it is in its actuality, and that he does this from his heart. This solid, deep, German mind which has intercourse with what is most inward, thus really exercises an immense power and force in order to make use of actuality as Notion, and to have what takes place in heaven around and within it. Just as Hans Sachs represented God, Christ and the Holy Ghost, as well as patriarchs and angels, in his own particular manner and as ordinary people like himself, not looking upon them as past and historic, so was it with Boehme.

To faith spirit has truth, but in this truth the moment of certainty of self is lacking. We have seen that the object of Christianity is the truth, the Spirit; it is given to faith as immediate truth. Faith possesses the truth, but unconsciously, without knowledge, without knowing it as its self-consciousness; and seeing that thought, the Notion, is necessarily in self-consciousness — the unity of opposites with Bruno — this unity is what is pre-eminently lacking to faith. Its moments as particular forms fall apart, more especially the highest moments — good and evil, or God and the Devil. God is, and the Devil likewise; both exist for themselves. But if God is absolute existence, the question may be asked, What absolute existence is this which has not all actuality, and more particularly evil within it? Boehme is hence on one side intent on leading the soul of man to the divine life, on inducing the soul to pay attention to the strife within itself, and make this the object of all its work and efforts; and then in respect of this content he strives to make out how evil is present in good — a question of

the present day. But because Boehme does not possess the Notion and is so far back in intellectual culture, there ensues a most frightful and painful struggle between his mind and consciousness and his powers of expression, and the import of this struggle is the profoundest Idea of God which seeks to bring the most absolute opposites into unity, and to bind them together — but not for thinking reason. Thus if we would comprehend the matter, Boehme's great struggle has been — since to him God is everything — to grasp the negative, evil, the devil, in and from God, to grasp God as absolute; and this struggle characterizes all his writings and brings about the torture of his mind. It requires a great and severe mental effort to bring together in one what in shape and form lie so far asunder; with all the strength that he possesses Boehme brings the two together, and therein shatters all the immediate significance of actuality possessed by both. But when thus he grasps this movement, this essence of spirit in himself, in his inward nature, the determination of the moments simply approaches more nearly to the form of self-consciousness, to the formless, or to the Notion. In the background, indeed, there stands the purest speculative thought, but it does not attain to an adequate representation. Homely, popular modes of conception likewise appear, a free out-spokenness which to us seems too familiar. With the devil, particularly, he has great dealings, and him he frequently addresses. "Come here," he says, "thou black wretch, what dost thou want? I will give thee a potion."[123] As Prospero in Shakespeare's "Tempest"[124] threatens Ariel that he will "rend an oak and peg him in his knotty entrails ... twelve winters," Boehme's great mind is confined in the hard knotty oak of the senses — in the gnarled concretion of the ordinary conception — and is not able to arrive at a free presentation of the Idea.

I shall shortly give Boehme's main conceptions, and then several particular forms which he in turn adopts; for he does not remain at one form, because neither the sensuous nor the religious can suffice. Now even

though this brings about the result that he frequently repeats himself, the forms of his main conceptions are still in every respect very different, and he who would try to give a consistent explanation of Boehme’s ideas, particularly when they pass into further developments, would only delude himself in making the attempt. Hence we must neither expect to find in Boehme a systematic presentation nor a true method of passing over into the individual. Of his thoughts we cannot say much without adopting his manner of expression, and quoting the particular passages themselves, for they cannot otherwise be expressed. The fundamental idea in Jacob Boehme is the effort to comprise everything in an absolute unity, for he desires to demonstrate the absolute divine unity and the union of all opposites in God. Boehme’s chief, and one may even say, his only thought — the thought that permeates all his works — is that of perceiving the holy Trinity in everything, and recognizing everything as its revelation and manifestation, so that it is the universal principle in which and through which everything exists; in such a way, moreover, that all things have this divine Trinity in themselves, not as a Trinity pertaining to the ordinary conception, but as the real Trinity of the absolute Idea. Everything that exists is, according to Boehme, this three-fold alone, and this three-fold is everything.[125] To him the universe is thus one divine life and revelation of God in all things, so that when examined more closely, from the one reality of God, the sum and substance of all powers and qualities, the Son who shines forth from these powers is eternally born; the inward unity of this light with the substance of the powers is Spirit. Sometimes the presentation is vague, and then again it is clearer. What comes next is the explanation of this Trinity, and here the different forms which he uses to indicate the difference becoming evident in the same, more especially appear.

In the *Aurora*, the “Root or Mother of Philosophy, Astrology and Theology,” he gives a method of division in which he places these sciences

in proximity, and yet appears merely to pass from one to the other without any clear definition or determination. "(1) In Philosophy divine power is treated of, what God is, and how in the Being of God nature, stars and *Elementa* are constituted; whence all things have their origin, what is the nature of heaven and earth, as also of angels, men and devils, heaven and hell and all that is creaturely, likewise what the two qualities in nature are, and this is dealt with out of a right ground in the knowledge of spirit, by the impulse and motion of God. (2) In astrology the powers of nature, of the stars and elements, are treated of, and how all creatures proceed from them, how evil and good are through them effected in men and animals. (3) In theology the kingdom of Christ is dealt with, as also its nature, and how it is set in opposition to hell, and how in nature it wars with the kingdom of darkness."[126]

1. What comes first is God the Father; this first is at once divided in itself and the unity of both its parts. "God is all," he says, "He is the Darkness and the Light, Love and Anger, Fire and Light, but He calls Himself God only as to the light of His love. There is an eternal *Contrarium* between darkness and light; neither comprehends the other and neither is the other, and yet there is but one essence or substance, though separated by pain; it is likewise so with the will, and yet there is no separable essence. One single principle is divided in this way, that one is in the other as a nothing which yet exists; but it is not manifest in the property of that thing in which it is."[127] By anguish is expressed that which we know as the absolute negativity — that is the self-conscious, self-experienced, the self-relating negativity which is therefore absolute affirmation. All Boehme's efforts were directed towards this point; the principle of the Notion is living in him, only he cannot express it in the form of thought. That is to say, all depends on thinking of the negative as simple, since it is at the same time an opposite; thus anguish [Qual] is the inward tearing asunder and yet likewise

the simple. From this Boehme derives sources or springs [Quellen], a good play on the words. For pain [die Qual], this negativity, passes into life, activity, and thus he likewise connects it with quality [Qualität], which he makes into Quallity.[128] The absolute identity of difference is all through present to him.

a. Boehme thus represents God not as the empty unity, but as this self-separating unity of absolute opposites; one must not, however, here expect a clearly defined distinction. The first, the one, the Father, has likewise the mode of natural existence; thus, like Proclus, he speaks of this God being simple essence. This simple essence he calls the hidden; and he therefore names it the *Temperamentum*, this unity of what is different, in which all is tempered. We find him also calling it the great Salitter — now the divine and now the natural Salitter — as well as Salniter. When he talks of this great salitter as of something known to us, we cannot first of all conceive what it means. But it is a vulgar corruption of the word *sal nitri*, saltpetre (which is still called salniter in Austria), *i.e.* just the neutral and in truth universal existence. The divine pomp and state is this, that in God a more glorious nature dwells, trees, plants, &c. "In the divine pomp or state two things have principally to be considered; salitter or the divine power, which brings forth all fruits, and marcurius or the sound."[129] This great salitter is the unrevealed existence, just as the Neo-Platonic unity is without knowledge of itself and likewise unrecognized.

b. This first substance contains all powers or qualities as not yet separated; thus this salitter likewise appears as the body of God, who embraces all qualities in Himself. Quality thus becomes an important conception, the first determination with Boehme; and he begins with qualities in his work "Morgenröthe im Aufgang." He afterwards associates with this the conferring of quality, and in the same place says: "Quality is

the mobility, boiling, springing, and driving of a thing." These qualities he then tries to define, but the account he gives of them is vague. "As for example heat which burns, consumes and drives forth all whatsoever comes into it which is not of the same property; and again it enlightens and warms all cold, wet, and dark things; it compacts and hardens soft things. It contains likewise two other kinds in it, namely Light and Fierceness" (Negativity); "of which the light or the heart of the heat is in itself a pleasant, joyful glance or lustre, a power of life ... and a source of the heavenly kingdom of joy. For it makes all things in this world living and moving; all flesh, trees, leaves, and grass grow in this world, as in the power of the light, and have their light therein, viz. in the good. Again, it contains also a fierceness or wrath which burns, consumes and spoils. This wrath or fierceness springs, drives, and elevates itself in the light, and makes the light movable. It wrestles and fights together in its two-fold source. The light subsists in God without heat, but it does not subsist so in nature. For all qualities in nature are one in another, in the same manner as God is all. For God" (the Father) "is the Heart." On another occasion (Vom dreifachen Leben des Menschen, chap. iv. § 68, p. 881) the Son is the heart of God; and yet again the Spirit is called the heart (Morgenröthe, chap. ii. § 13, p. 29) "or fountain of nature, and from Him comes all. Now heat reigns and predominates in all powers in nature and warms all, and is one source or spring in all. But the light in the heat gives power to all qualities, for that all grow pleasant and joyful." Boehme goes over quite a list of qualities: cold, hot, bitter, sweet, fierce, acid, hard, dense, soft qualities, sound, etc. "The bitter quality is in God also, but not in that manner as the gall is in man, but it is an everlasting power, in an elevating, triumphing spring or source of joy. All the creatures are made from these qualities, and live therein as in their mother."[130]

"The virtues of the stars are nature itself. Everything in this world proceeds from the stars. That I shall prove to you if you are not a blockhead and have a little reason. If the whole *Curriculum* or the whole circumference of the stars is considered, we soon find that this is the mother of all things, or the nature from which all things have arisen and in which all things stand and live, and through which all things move. And all things are formed from these same powers and remain eternally therein." Thus it is said that God is the reality of all realities. Boehme continues: "You must, however, elevate your mind in the Spirit, and consider how the whole of nature, with all the powers which are in nature, also extension, depth and height, also heaven and earth and all whatsoever is therein, and all that is above the heavens, is together the Body and Corporeity of God; and the powers of the stars are the fountain veins in the natural Body of God, in this world. You must not conceive that in the Body of the stars is the whole triumphing Holy Trinity, God the Father, Son, and Holy Ghost. But we must not so conceive as if God was not at all in the *Corpus* or Body of the stars, and in this world.... Here now the question is, From whence has heaven, or whence borrows it this power, that it causes such mobility in nature? Here you must lift up your eyes beyond nature into the light, holy, triumphing, divine power, into the unchangeable holy Trinity, which is a triumphing, springing, movable Being, and all powers are therein, as in nature: of this heaven, earth, stars, elements, devils, angels, men, beasts, and all have their Being; and therein all stands. When we nominate heaven and earth, stars and elements, and all that is therein, and all whatsoever is above the heaven, then thereby is nominated the total God, who has made Himself creaturely in these above-mentioned" many "Beings, in His power which proceedeth forth from Him."[131]

c. Boehme further defines God the Father as follows: "When we consider the whole nature and its property, then we see the Father: when we

behold heaven and the stars, then we behold His eternal power and wisdom. So many stars as stand in the whole heaven, which are innumerable, so manifold and various is the power and wisdom of God the Father. Every star differs in its quality." But "you must not conceive here that every power which is in the Father stands in a peculiar severed or divided part and place in the Father, as the stars do in heaven. No, but the Spirit shows that all the powers in the Father," as the fountainhead, "are one in another as one power." This whole is the universal power which exists as God the Father, wherein all differences are united; "creaturely" it, however, exists as the totality of stars, and thus as separation into the different qualities. "You must not think that God who is in heaven and above the heaven does there stand and hover like a power and quality which has in it neither reason nor knowledge, as the sun which turns round in its circle and shoots forth from itself heat and light, whether it be for benefit or hurt to the earth and creatures. No, the Father is not so, but He is an All-mighty, All-wise, All-knowing, All-seeing, All-hearing, All-smelling, All-tasting God, who in Himself is meek, friendly, gracious, merciful, and full of joy, yea Joy itself."[132]

Since Boehme calls the Father all powers, he again distinguishes these as the seven first originating spirits.[133] But there is a certain confusion in this and no thought-determination, no definite reason for there being exactly seven — such precision and certainty is not to be found in Boehme. These seven qualities are likewise the seven planets which move and work in the great Salitter of God; "the seven planets signify the seven spirits of God or the princes of the angels." But they are in the Father as one unity, and this unity is an inward spring and fermentation. "In God all spirits triumph as one spirit, and a spirit ever calms and loves the others, and nothing exists excepting mere joy and rapture. One spirit does not stand alongside the others like stars in heaven, for all seven are contained within one another as

one spirit. Each spirit in the seven spirits of God is pregnant with all seven spirits of God;" thus each is in God itself a totality. "One brings forth the other in and through itself;" this is the flashing forth of the life of all qualities.[134]

2. As what came first was the source and germ of all powers and qualities, what comes second is process. This second principle is a very important conception, which with Boehme appears under very many aspects and forms, viz. as the Word, the Separator, Revelation — speaking generally the "I," the source of all difference, and of the will and implicit Being which are in the powers of natural things; but in such a way that the light therein likewise breaks forth which leads them back to rest.

a. God as the simple absolute existence is not God absolutely; in Him nothing can be known. What we know is something different — but this "different" is itself contained in God as the perception and knowledge of God. Hence of the second step Boehme says that a separation must have taken place in this temperament. "No thing can become manifest to itself without opposition; for if it has nothing to withstand it, it always goes forward on its own account and does not go back within itself. But if it does not go back into itself as into that from which it originally arose, it knows nothing of its original state." Original state [Urstand] he makes use of for substance; and it is a pity that we cannot use this and many other striking expressions. "Without adversity life would have no sensibility nor will nor efficacy, neither understanding nor science. Had the hidden God who is one solitary existence and will not of His own will brought Himself out of Himself, out of the eternal knowledge in the *Temperamento*, into divisibility of will, and introduced this same element of divisibility into an inclusiveness" (Identity) "so as to constitute it a natural and creaturely life, and had this element of separation in life not come into warfare, how was

the will of God which is only one to be revealed to Himself? How could a knowledge of itself be present in a solitary will?”[135] We see that Boehme is elevated infinitely above the empty abstraction of the highest reality, etc.

Boehme continues: “The commencement of all Beings is the Word as the breath of God, and God has become the eternal One of eternity and likewise remains so in eternity. The Word is the eternal beginning and remains so eternally, for it is the revelation of the eternal One through and by which the divine power is brought into one knowledge of somewhat. By the Word we understand the revealed will of God: by the Word we mean God the hidden God, from whom the Word eternally springs forth. The Word is the efflux of the divine One, and yet God Himself as His revelation.” Λόγος is more definite than Word, and there is a delightful double significance in the Greek expression indicating as it does both reason and speech. For speech is the pure existence of spirit; it is a thing which when once heard goes back within itself. “What has flowed out is wisdom, beginning and cause of all powers, colours, virtue and qualities.”[136]

Of the Son Boehme says: “The Son is” of the Father and “in the Father, the heart of the Father or light, and the Father beareth him ever, from eternity to eternity.” Thus “the Son is” indeed “another Person from the Father, though no other,” but the same “God as the Father,” whose image he is.[137] “The Son is the Heart” or the pulsating element “in the Father; all the powers which are in the Father are the propriety of the Father; and the Son is the heart or the kernel in all the powers in the whole Father, and he is the cause of the springing joy in all powers in the whole Father. From the Son the eternal joy rises and springs in all the powers of the Father, as the sun does in the heart of the stars. It signifies the Son, as the circle of the stars signifies the manifold powers of the Father; it lightens the heavens, the stars and the deep above the earth, working in all things that are in this world; it enlightens and gives power to all the stars and tempers their power. The Son

of God is continually generated from all the powers of his Father from eternity, just as the sun is born of the stars; He is ever born and is not made, and is the heart and lustre shining forth from all powers. He shines in all powers of the Father, and his power is the moving, springing joy in all the powers of the Father, and shines in the whole Father as the sun does in the whole world. For if the Son did not shine in the Father, the Father would be a dark valley; for the Father's power would not rise from eternity to eternity, and so the divine Being would not subsist."[138] This life of the Son is an important matter; and in regard to this issuing forth and manifestation Boehme has likewise brought forward the most important assertions.

b. "From such a revelation of powers in which the will of the eternal One contemplates itself, flows the understanding and the knowledge of the something [Ichts], since the eternal will contemplates itself in the something [Ichts]." "Ichts" is a play upon the word "Nichts" (nothing), for it is simply the negative; yet it is at the same time the opposite of nothing, since the Ich (Ego) of self-consciousness is contained in it. The Son, the something, is thus "I," consciousness, self-consciousness: God is not only the abstract neutral but likewise the gathering together of Himself into the point of Being-for-self. The "other" of God is thus the image of God. "This similitude is the *Mysterium magnum*, viz. the creator of all beings and creatures; for it is the separator" (of the whole) "in the efflux of the will which makes the will of the eternal One separable — the separability in the will from which powers and qualities take their rise." This separator is "constituted the steward of nature, by whom the eternal will rules, makes, forms and constitutes all things." The separator is effectuating and self-differentiating, and Boehme calls this "Ichts," likewise Lucifer, the first-born Son of God, the creaturely first-born angel who was one of the seven spirits. "But this Lucifer has fallen and Christ has come in his place."[139] This is the connection of the devil with God, namely other-Being and then

Being-for-self or Being-for-one, in such a way that the other is for one; and this is the origin of evil in God and out of God. This is the furthest point of thought reached by Jacob Boehme. He represents this Fall of Lucifer as that the "Ichts," *i.e.* self-knowledge, the "I" [Ichheit] (a word which we find used by him), the inward imagining of self, the inward fashioning of self (the being-for-self), is the fire which absorbs all things. This is the negative side in the separator, the anguish; or it is the wrath of God. This divine wrath is hell and the devil, who through himself imagines himself into himself. This is very bold and speculative; Boehme here seeks to show in God Himself the sources of the divine anger. He also calls the will of the something ["Ichts"] self-hood; it is the passing over of the something ["Ichts"] into the nothing [Nichts], the "I" imagining itself within itself. He says: "Heaven and hell are as far removed from one another as day and night, as something and nothing." Boehme has really here penetrated into the utmost depths of divine essence; evil, matter, or whatever it has been called, is the I = I, the Being-for-self, the true negativity. Before this it was the *nonens* which is itself positive, the darkness; but the true negativity is the "I." It is not anything bad because it is called the evil; it is in mind alone that evil exists, because it is conceived therein as it is in itself. "Where the will of God willeth in anything, there God is manifested, and in that manifestation the angels also dwell; but where God in any thing willeth not with the will of the thing, there God is not manifested to it, but dwelleth" (there) "in Himself without the co-operating of the thing;" in that case "in that thing is its own will, and there the devil dwelleth and all whatever is without God."[140]

Boehme in his own way sets forth the form further assumed in this process in a pictorial manner. This "*Separator* deduces qualities from itself, from which the infinite manifold arises, and through which the eternal One makes itself perceptible" (so that it is for others) "not according to the unity,

but in accordance with the efflux of the unity." Implicit Being and the manifold are absolutely opposed through the Notion, which Boehme did not have: Being-for-self implies Being-for-another and retrogression into the opposite. Boehme sways backwards and forwards in apparent contradictions, and does not well know how to find a way out of the difficulty. "But the efflux is carried on to the greatest extreme possible, to the generation of fire" — dark fire without light, darkness, the hidden, the self;[141]— "in which fiery nature," however, since this fire rises and shoots up, "the eternal One becomes majestic and a light," and this light which there breaks forth is the form which the other principle assumes. This is the return to the One. "Thereby" (through fire) "the eternal power becomes desirous and effectual and" (fire) "is the original condition" (essence) "of the sensitive" (feeling) "life, where in the Word of power an eternal sensitive life first takes its origin. For if life had no sensitiveness, it would have no will nor efficacy; but pain" — anguish, suffering — first "makes it" (all life) "effectual and endows it with will. And the light of such kindling through fire makes it joyous, for it is an anointment," joy and loveliness "of painfulness."[142]

Boehme turns this round in many ways in order to grasp the something [Ichts], the Separator, as it "rises"[143] from the Father. The qualities rise in the great Salitter, stir, raise, and move [rügen] themselves. Boehme has there the quality of astringency in the Father, and he then represents the process of the something [Ichts] as a sharpness, a drawing together, as a flash of lightning that breaks forth. This light is Lucifer. The Being-for-self, the self-perception, is by Boehme called the drawing together into a point. That is astringency, sharpness, penetration, fierceness; to this pertains the wrath of God, and here Boehme in this manner grasps the "other" of God in God Himself. "This source can be kindled through great motion or elevation. Through the contraction the creaturely Being is formed so that a

heavenly *Corpus* may be" intelligibly "formed. But if it" — the sharpness— "be kindled through elevation, which those creatures only can do which are created out of the divine Salitter, then it is a burning source-vein of the wrath of God. The flash is the mother of light; for the flash generates the light, and is the Father of the fierceness; for the fierceness abides in the flash as a seed in the father, and that flash generates also the tone or sound" — the flash is, speaking generally, the absolute generator. The flash is still connected with pain; light is what brings intelligence. The divine birth is the going forth of the flash, of the life of all qualities.[144] This is all from the Aurora.

In the *Quæstionibus theosophicis* Boehme makes particular use of the form of Yes and No for the separator, for this opposition. He says: "The reader must know that in Yes and No all things consist, whether divine, devilish, earthly, or what they may be called. The One as the Yes is pure power and life, and it is the truth of God or God Himself. He would be unknowable in Himself, and in Him there would be no joy nor elevation, nor feeling" — life— "without the No. The No is a counterstroke of the Yes, or of the truth" (this negativity is the principle of all knowledge, comprehension), "that the truth may be manifest and be a something wherein there is a *contrarium* in which there is the eternal love, moving, feeling, and willing, and demanding to be loved. And yet we cannot say that the Yes is separated from the No, and that they are two things in proximity; for they are only one thing, but they separate themselves into two beginnings and make two *centra*, where each works and wills in itself. Without those two, which are continually in strife, all things would be a nothing, and would stand still without movement. If the eternal will did not itself flow from itself and introduce itself into receptibility, there would be no form nor distinction, for all powers would" then "be one power. Neither could there be understanding in that case, for the understanding arises" (has

its substance) “in the differentiation of the manifold, where one property sees, proves and wills the others. The will which has flowed out wills dissimilarity, so that it may be distinguished from similarity and be its own something — and that something may exist, that the eternal seeing may see and feel. And from the individual will arises the No, for it brings itself into ownness, *i.e.* receptivity of self. It desires to be something and does not make itself in accordance with unity; for unity is a Yes which flows forth, which ever stands thus in the breathing forth of itself, being imperceptible; for it has nothing in which it can find itself excepting in the receptivity of the dissentient will, as in the No which is counterstroke to the Yes, in which the Yes is indeed revealed, and in which it possesses something which it can will. And the No is therefore called a No, because it is a desire turned inwards on itself, as if it were a shutting up into negativity. The emanated seeking will is absorbent and comprehends itself within itself, from it come forms and qualities: (1) Sharpness, (2) Motion, (3) Feeling. (4) The fourth property is Fire as the flash of light; this rises in the bringing together of the great and terrible sharpness and the unity. Thus in the contact a *Flagrat* [Schrack] results, and in this *Flagrat* [Schrack] unity is apprehended as being a Flash or Gleam, an exulting joy.” That is the bursting forth of the unity. “For thus the light arises in the midst of the darkness, for the unity becomes a light, and the receptivity of the carnal will in the qualities becomes a Spirit-fire which has its source and origin out of the sharp, cold astringency. And according to that, God is an angry” and “jealous God,” and in this we have evil. “(*a*) The first quality of the absorption is the No; (*b*) Sharpness; (*c*) Hardness; (*d*) Feeling; (*e*) the source of fire, hell or hollowness, Hiddenness. (5) The fifth quality, Love, makes in the fire, as in pain, another *Principium* as a great fire of love.”[145] These are the main points under the second head. In such depths Boehme keeps struggling on, for to him conceptions are lacking, and there are only religious and

chemical forms to be found; and because he uses these in a forced sense in order to express his ideas, not only does barbarism of expression result, but incomprehensibility as well.

c. “From this eternal operation of the sensation the visible world sprang; the world is the Word which has flowed forth and has disposed itself into qualities, since in qualities the particular will has arisen. The *Separator* has made it a will of its own after such a fashion.”[146] The world is none other than the essence of God made creaturely.[147] Hence “If thou beholdest the Deep” of the heavens, “the Stars, the Elements and the Earth,” and what they have brought forth, “then thou” certainly “comprehendest not with thy eyes the bright and clear Deity, though indeed it is” likewise “there and in them.” Thou seest only their creaturely manifestation. “But if thou raisest thy thoughts and considerest ... God who rules in holiness in this government or dominion, then thou breakest through the heaven of heavens and apprehendest God at His holy heart. The powers of heaven ever operate in images, growths and colours, in order to reveal the holy God, so that He may be in all things known.”[148]

3. Finally what comes third in these three-fold forms is the unity of the light, of the separator and power: this is the spirit, which is already partially implied in what has preceded. “All the stars signify the power of the Father, and from them issues the sun” (they make themselves a counterstroke to unity). “And from all the stars there goes forth the power which is in every star, into the Deep, and the power, heat and shining of the sun goes likewise into the Deep” — back to the stars, into the power of the Father. “And in the Deep the power of all stars, together with the heat and lustre of the sun, are all but one thing, a moving, boiling Hovering, like a spirit or matter. Now in the whole deep of the Father, externally without the Son, there is nothing but the manifold and unmeasurable or unsearchable power of the Father and the Light of the Son. The Light of the Son is in the Deep of the Father a

living, all-powerful, all-knowing, all-hearing, all-seeing, all-smelling, all-tasting, all-feeling Spirit, wherein is all power, splendour, and wisdom, as in the Father and the Son."[149] That is Love, the softener of all powers through the light of the Son. We see that the sensuous element thus pertains to this.

Boehme really has the idea that "God's essence" (which has proceeded from the eternal deep as world) "is thus not something far away which possesses a particular position or place, for" essence, "the abyss of nature and creation, is God Himself. Thou must not think that in heaven there was some manner of *Corpus*" — the seven spirits generate this *Corpus* or heart — "which above all other things is called God. No; but the whole divine power which itself is heaven and the heaven of all heavens, is so generated, and that is called God the Father; of whom all the holy angels are generated, in like manner also the spirit of all men. Thou canst name no place, either in heaven or in this world, where the divine birth is not. The birth of the divine Trinity likewise takes place in thine own heart; all three persons are generated in thy heart, God the Father, Son and Holy Ghost. In the divine power everywhere we find the fountain spring of the divine birth; and there already are all the seven qualifying or fountain spirits of God, as if thou wouldst make a spacious creaturely circumscribed circle and hadst the deity therein."[150] In every spirit all are contained.

To Boehme this trinity is the complete universal life in each individual, it is absolute substance. He says: "All things in this world are according to the similitude of this ternary. Ye blind Jews, Turks, and Heathens, open wide the eyes of your mind: I will show you, in your body, and in every natural thing, in men, beasts, fowls, and worms, also in wood, stone, leaves, and grass, the likeness of the holy ternary in God. You say, there is but one Being in God, and that God has no Son. Open your eyes and consider your selves: man is made according to the similitude and out of the power of God in his ternary. Behold thy inward man, and then thou wilt see it most plainly

and clearly, if thou art not a fool and an irrational beast. Therefore observe, in thy heart, in thy veins, and in thy brain, thou hast thy spirit; and all the powers which move in thy heart, in thy veins, and in thy brain, wherein thy life consists, signify God the Father. From that power springs up [gebaret] thy light, so that thou seest, understandest, and knowest in the same power what thou art to do; for that light glimmers in thy whole body; and the whole body moves in the power and knowledge of the light; this is the Son which is born in thee." This light, this seeing and understanding, is the second determination; it is the relationship to itself. "Out of thy light goes forth into the same power, reason, understanding, skill, and wisdom, to govern the whole body, and to distinguish all whatsoever is externally without the body. And both these are but one in the government of thy mind, viz. thy spirit, which signifies God the Holy Ghost. And the Holy Ghost from God rules in this spirit in thee, if thou art a child of light and not of darkness. Now observe: in either wood, stone, or herbs there are three things contained, neither can anything be generated or grow, if but one of the three should be left out. First, there is the power, from which a body comes to be, whether wood, stone, or herbs; after that there is in that" thing "a sap which is the heart of the thing. And thirdly there is in it a springing, flowing power, smell, or taste, which is the spirit of the thing whereby it grows and increases. Now if any of these three fail, the thing cannot subsist."[151] Thus Boehme regards everything as this ternary.

When he comes into particulars we see that he is obscure; from his detailed explanations there is therefore not much to be derived. As showing his manner of apprehending natural things I shall give one more example of the manner in which, in the further working out of the existence of nature as a counterstroke to the divine knowledge, he makes use of what we call things as Notions (*supra*, p. 192). The creaturely, he says, has "three kinds of powers or *Spiritus* in different *Centris*, but in one *Corpore*. (α) The first

and external *Spiritus* is the coarse sulphur, salt and *Mercurius*, which is a substance of four elements" (fire, water, earth, air) "or of the stars. It forms the visible *Corpus* according to the constellation of the stars or property of the planets and now enkindled elements — the greatest power of the *Spiritus mundi*. The *Separator* makes the signature or sign" — the self. The salt, the salitter, is approximately the neutral: mercury [Merk or Mark] the operating, unrest as against nourishment; the coarse sulphur, the negative unity. (β) "The other *Spiritus* is found in the oil of sulphur, the fifth essence, viz. a root of the four elements. That is the softening and joy of the coarse, painful spirit of sulphur and salt; the real cause of growing life, a joy of nature as is the sun in the elements" — the direct principle of life. "In the inward ground of that coarse spirit we see a beautiful, clear *Corpus* in which the ideal light of nature shines from the divine efflux." The outward separator signs what is taken up with the shape and form of the plant which receives into itself this coarse nourishment. (γ) "What comes third is the tincture, a spiritual fire and light; the highest reason for which the first separation of qualities takes place in the existence of this world. *Fiat* is the Word of each thing and belongs according to its peculiar quality to eternity. Its origin is the holy power of God. Smell [Ruch] is the sensation of this tincture. The elements are only a mansion and counterstroke of the inward power, a cause of the movement of the tincture."[152] Sensuous things entirely lose the force of sensuous conceptions. Boehme uses them, though not as such, as thought determinations, that constitutes the hard and barbarous element in Boehme's representations, yet at the same time this unity with actuality and this present of infinite existence.

Boehme describes the opposition in creation in the following way. If nature is the first efflux of the *Separator*, two kinds of life must yet be understood as in the counterstroke of the divine essence, beyond that temporal one there is an eternal, to which the divine understanding is given.

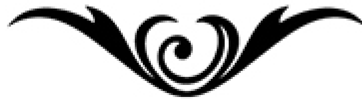
It stands at the basis of the eternal, spiritual world, in the *Mysterium Magnum* of the divine counterstroke (personality) — a mansion of divine will through which it reveals itself and is revealed to no peculiarity of personal will. In this *centrum* man has both lives in himself, he belongs to time and eternity. He is (α) universal in the “eternal understanding of the one good will which is a temperament; (β) the original will of nature, viz. the comprehensibility of the *Centra*, where each *centrum* in the divisibility shuts itself in one place to egotism and self-will as a personal *Mysterium* or mind. The former only requires a counterstroke to its similarity; this latter, the self-generated natural will also requires in the place of the egotism of the dark impression a likeness, that is a counterstroke through its own comprehensibility, through which comprehension it requires nothing but its corporality as a natural ground.” Now it is this “I,” the dark, pain, fire, the wrath of God, implicitude, self-comprehension, which is broken up in regeneration; the I is shattered, painfulness brought into true rest — just as the dark fire breaks into light.[153]

Now these are the principal ideas found in Boehme; those most profound are (α) the generating of Light as the Son of God from qualities, through the most living dialectic; (β) God’s diremption of Himself. Barbarism in the working out of his system can no more fail to be recognized than can the great depths into which he has plunged by the union of the most absolute opposites. Boehme grasps the opposites in the crudest, harshest way, but he does not allow himself through their unworkableness to be prevented from asserting the unity. This rude and barbarous depth which is devoid of Notion, is always a present, something which speaks from itself, which has and knows everything in itself. We have still to mention Boehme’s piety, the element of edification, the way in which the soul is guided in his writings. This is in the highest degree deep and inward, and if one is familiar with his form these depths and this inwardness will be found. But it is a form with

which we cannot reconcile ourselves, and which permits no definite conception of details, although we cannot fail to see the profound craving for speculation which existed within this man.

SECTION TWO. Period of the Thinking Understanding

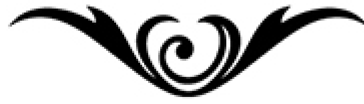
AFTER NEO-PLATONISM AND all that is associated with it is left behind, it is not until Descartes is arrived at that we really enter upon a philosophy which is, properly speaking, independent, which knows that it comes forth from reason as independent, and that self-consciousness is an essential moment in the truth. Philosophy in its own proper soil separates itself entirely from the philosophizing theology, in accordance with its principle, and places it on quite another side. Here, we may say, we are at home, and like the mariner after a long voyage in a tempestuous sea, we may now hail the sight of land; with Descartes the culture of modern times, the thought of modern Philosophy, really begins to appear, after a long and tedious journey on the way which has led so far. It is specially characteristic of the German that the more servile he on the one hand is, the more uncontrolled is he on the other; restraint and want of restraint — originality, is the angel of darkness that buffets us. In this new period the universal principle by means of which everything in the world is regulated, is the thought that proceeds from itself; it is a certain inwardness, which is above all evidenced in respect to Christianity, and which is the Protestant principle in accordance with which thought has come to the consciousness of the world at large as that to which every man has a claim. Thus because the independently existent thought, this culminating point of inwardness, is now set forth and firmly grasped as such, the dead externality of authority is set aside and regarded as out of place. It is only through my own free thought within that thought can however be recognized and ratified by me. This likewise signifies that such free thought is the universal business of the world and of individuals; it is indeed the duty of every man, since everything is based



upon it; thus what claims to rank as established in the world man must scrutinize in his own thoughts. Philosophy is thus become a matter of universal interest, and one respecting which each can judge for himself; for everyone is a thinker from the beginning.

On account of this new beginning to Philosophy we find in the old histories of Philosophy of the seventeenth century — *e.g.* that of Stanley — the philosophy of the Greeks and Romans only, and Christianity forms the conclusion. The idea was that neither in Christianity nor subsequently any philosophy was to be found, because there was no longer a necessity for it, seeing that the philosophic theology of the Middle Ages had not free, spontaneous thought as its principle (Vol. I. pp. 111, 112). But though it is true that this has now become the philosophic principle, we must not expect that it should be at once methodically developed out of thought. The old assumption is made, that man only attains to the truth through reflection; this plainly is the principle. But the determination and definition of God, the world of the manifold as it appears, is not yet revealed as necessarily proceeding from thought; for we have only reached the thought of a content which is given through ordinary conception, observation, and experience.

On the one hand we see a metaphysic, and, on the other, the particular sciences: on the one hand abstract thought as such, on the other its content taken from experience; these two lines in the abstract stand opposed to one another, and yet they do not separate themselves so sharply. We shall indeed come to an opposition, viz. to that between *a priori* thought — that the determinations which are to hold good for thought must be taken from thought itself — and the determination that we must commence, conclude and think from experience. This is the opposition between rationalism and empiricism; but it is really a subordinate one, because even the metaphysical mode in philosophy, which only allows validity to immanent thought, does not take what is methodically developed from the necessity of



thought, but in the old way derives its content from inward or outward experience, and through reflection and meditation renders it abstract. The form of philosophy which is first reached through thought is metaphysics, the form of the thinking understanding; this period has, as its outstanding figures, Descartes and Spinoza, likewise Malebranche and Locke, Leibnitz and Wolff. The second form is Scepticism and Criticism with regard to the thinking understanding, to metaphysics as such, and to the universal of empiricism; here we shall go on to speak of representatives of the Scottish, German, and French philosophies; the French materialists again turn back to metaphysics.

CHAPTER I. The Metaphysics of the Understanding

METAPHYSICS IS WHAT reaches after substance, and this implies that one unity, one thought is maintained in opposition to dualism, just as Being was amongst the ancients. In metaphysics itself we have, however, the opposition between substantiality and individuality. What comes first is the spontaneous, but likewise uncritical, metaphysics, and it is represented by Descartes and Spinoza, who assert the unity of Being and thought. The second stage is found in Locke, who treats of the opposition itself inasmuch as he considers the metaphysical Idea of experience, that is the origin of thoughts and their justification, not yet entering on the question of whether they are absolutely true. In the third place we have Leibnitz's monad — the world viewed as a totality.

A. First Division.

WE HERE ENCOUNTER the innate ideas of Descartes. The philosophy of Spinoza, in the second place, is related to the philosophy of Descartes as its necessary development only; the method is an important part of it. A method which stands alongside of Spinozism and which is also a perfected development of Cartesianism, is, in the third place, that by which Malebranche has represented this philosophy.

1. Descartes.

René Descartes is a bold spirit who re-commenced the whole subject from the very beginning and constituted afresh the ground-work on which Philosophy is based, and to which, after a thousand years had passed, it once more returned. The extent of the influence which this man exercised upon his times and the culture of Philosophy generally, cannot be sufficiently expressed; it rests mainly in his setting aside all former presuppositions and beginning in a free, simple, and likewise popular way, with popular modes of thought and quite simple propositions, in his leading the content to thought and extension or Being, and so to speak setting up this before thought as its opposite. This simple thought appeared in the form of the determinate, clear understanding, and it cannot thus be called speculative thought or speculative reason. There are fixed determinations from which Descartes proceeds, but only of thought; this is the method of his time. What the French called exact science, science of the determinate understanding, made its appearance at this time. Philosophy and exact

science were not yet separated, and it was only later on that this separation first took place.

To come to the life of Descartes — he was born in 1596, at La Haye in Touraine, of an ancient and noble race. He received an education of the usual kind in a Jesuit school, and made great progress; his disposition was lively and restless; he extended his insatiable zeal in all directions, pursued his researches into all systems and forms; his studies, in addition to ancient literature, embraced such subjects as philosophy, mathematics, chemistry, physics, and astronomy. But the studies of his youth in the Jesuit school, and those studies which he afterwards prosecuted with the same diligence and strenuous zeal, resulted in giving him a strong disinclination for learning derived from books; he quitted the school where he had been educated, and yet his eagerness for learning was only made the keener through this perplexity and unsatisfied yearning. He went as a young man of eighteen to Paris, and there lived in the great world. But as he here found no satisfaction, he soon left society and returned to his studies. He retired to a suburb of Paris and there occupied himself principally with mathematics, remaining quite concealed from all his former friends. At last, after the lapse of two years, he was discovered by them, drawn forth from his retirement, and again introduced to the great world. He now once more renounced the study of books and threw himself into the affairs of actual life. Thereafter he went to Holland and entered the military service; soon afterwards, in 1619, and in the first year of the Thirty Years' War, he went as a volunteer with the Bavarian troops, and took part in several campaigns under Tilly. Many have found learning unsatisfying; Descartes became a soldier — not because he found in the sciences too little, but because they were too much, too high for him. Here in his winter quarters he studied diligently, and in Ulm, for instance, he made acquaintance with a citizen who was deeply versed in mathematics. He was able to carry out his studies

even better in winter quarters at Neuberg on the Danube, where once more, and now most profoundly, the desire awoke in him to strike out a new departure in Philosophy and entirely reconstruct it; he solemnly promised the Mother of God to make a pilgrimage to Loretto if she would prosper him in this design, and if he should now at last come to himself and attain to peace. He was also in the battle at Prague in which Frederick the Elector-Palatine lost the Bohemian crown. Yet since the sight of these wild scenes could not satisfy him, he gave up military service in 1621. He made several other journeys through the rest of Germany, and then proceeded to Poland, Prussia, Switzerland, Italy and France. On account of its greater freedom he withdrew to Holland, in order there to pursue his projects; here he lived in peace from 1629 to 1644 — a period in which he composed and issued most of his works, and also defended them against the manifold attacks from which they suffered, and which more especially proceeded from the clergy. Queen Christina of Sweden finally called him to her court at Stockholm, which was the rendezvous for all the most celebrated men of learning of the time, and there he died in 1650.[154]

As regards his philosophic works, those which contain his first principles have in particular something very popular about their method of presentation, which makes them highly to be recommended to those commencing the study of philosophy. Descartes sets to work in a quite simple and childlike manner, with a narration of his reflections as they came to him. Professor Cousin of Paris has brought out a new edition of Descartes in eleven octavo volumes; the greater part consists of letters on natural phenomena. Descartes gave a new impetus to mathematics as well as to philosophy. Several important methods were discovered by him, upon which the most brilliant results in higher mathematics were afterwards built. His method is even now an essential in mathematics, for Descartes is the inventor of analytic geometry, and consequently the first to point out the

way in this field of science to modern mathematics. He likewise cultivated physics, optics, and astronomy, and made the most important discoveries in these; we have not, however, to deal with such matters. The application of metaphysics to ecclesiastical affairs, investigations, etc., has likewise no special interest for us.

1. In Philosophy Descartes struck out quite original lines; with him the new epoch in Philosophy begins, whereby it was permitted to culture to grasp in the form of universality the principle of its higher spirit in thought, just as Boehme grasped it in sensuous perceptions and forms. Descartes started by saying that thought must necessarily commence from itself; all the philosophy which came before this, and specially what proceeded from the authority of the Church, was for ever after set aside. But since here thought has properly speaking grasped itself as abstract understanding only, in relation to which the more concrete content still stands over on the other side, the determinate conceptions were not yet deduced from the understanding, but taken up only empirically. In Descartes' philosophy we have thus to distinguish what has, and what has not universal interest for us: the former is the process of his thoughts themselves, and the latter the mode in which these thoughts are presented and deduced. Yet we must not consider the process as a method of consistent proof; it is indeed a deep and inward progress, but it comes to us in an ingenuous and naïve form. In order to do justice to Descartes' thoughts it is necessary for us to be assured of the necessity for his appearance; the spirit of his philosophy is simply knowledge as the unity of Thought and Being. And yet on the whole there is little to say about his philosophy.

a. Descartes expresses the fact that we must begin from thought as such alone, by saying that we must doubt everything (*De omnibus dubitandum est*); and that is an absolute beginning. He thus makes the abolition of all determinations the first condition of Philosophy. This first proposition has

not, however, the same signification as Scepticism, which sets before it no other aim than doubt itself, and requires that we should remain in this indecision of mind, an indecision wherein mind finds its freedom. It rather signifies that we should renounce all prepossessions — that is, all hypotheses which are accepted as true in their immediacy — and commence from thought, so that from it we should in the first place attain to some fixed and settled basis, and make a true beginning. In Scepticism this is not the case, for with the sceptics doubt is the end at which they rest.[155] But the doubting of Descartes, his making no hypotheses, because nothing is fixed or secure, does not occur in the interests of freedom as such, in order that nothing should have value except freedom itself, and nothing exist in the quality of an external objective. To him everything is unstable indeed, in so far as the Ego can abstract from it or can think, for pure thought is abstraction from everything. But in consciousness the end is predominant, and it is to arrive at something fixed and objective — and not the moment of subjectivity, or the fact of being set forth, known and proved by me. Yet this last comes along with the other, for it is from the starting point of my thought that I would attain my object; the impulse of freedom is thus likewise fundamental.

In the propositions in which Descartes gives in his own way the ground of this great and most important principle, there is found a naïve and empirical system of reasoning. This is an example: “Because we were born as children, and formed all manner of judgments respecting sensuous things before we had the perfect use of our reason, we are through many preconceived ideas hindered from the knowledge of the truth. From these we appear not to be able to free ourselves in any other way but by once in our lives striving to doubt that respecting which we have the very slightest suspicion of an uncertainty. Indeed it is really desirable to hold as false everything in respect to which we have any doubt, so that we may find

more clearly what is most certain and most knowable. Yet this doubt has to be limited to the contemplation of the truth, for in the conduct of our life we are compelled to choose the probable, since there the opportunity for action would often pass away before we could solve our doubts. But here, where we have only to deal with the search for truth, we may very reasonably doubt whether any thing sensuous and perceptible exists — in the first place because we find that the senses often deceive us and it is prudent not to trust in what has even once deceived us, and then because every day in dreaming we think we feel or see before ourselves innumerable things which never were, and to the doubter no signs are given by which he can safely distinguish sleeping from waking. We shall hereby likewise doubt everything else, even mathematical propositions, partly because we have seen that some err even in what we hold most certain, and ascribe value to what to us seems false, and partly because we have heard that a God exists who has created us, and who can do everything, so that He may have created us liable to err. But if we conceive ourselves not to derive our existence from God, but from some other source, perhaps from ourselves, we are all the more liable, in that we are thus imperfect, to err. But we have so far the experience of freedom within us that we can always refrain from what is not perfectly certain and well founded."[156] The demand which rests at the basis of Descartes' reasonings thus is that what is recognized as true should be able to maintain the position of having the thought therein at home with itself. The so-called immediate intuition and inward revelation, which in modern times is so highly regarded, has its place here. But because in the Cartesian form the principle of freedom as such is not brought into view, the grounds which are here advanced are for the most part popular.

b. Descartes sought something in itself certain and true, which should neither be only true like the object of faith without knowledge, nor the sensuous and also sceptical certainty which is without truth. The whole of

Philosophy as it had been carried on up to this time was vitiated by the constant presupposition of something as true, and in some measure, as in the Neo-Platonic philosophy, by not giving the form of scientific knowledge to its matter, or by not separating its moments. But to Descartes nothing is true which does not possess an inward evidence in consciousness, or which reason does not recognize so clearly and conclusively that any doubt regarding it is absolutely impossible. “Because we thus reject or declare to be false everything regarding which we can have any doubt at all, it is easy for us to suppose that there is no God, no heaven, no body — but we cannot therefore say that we do not exist, who think this. For it is contradictory to say that what thinks does not exist. Hence the knowledge that ‘I think, therefore I am,’ is what we arrive at first of all, and it is the most certain fact that offers itself to everyone who follows after philosophy in an orderly fashion. This is the best way of becoming acquainted with the nature of spirit and its diversity from body. For if we inquire who we are who can set forth as untrue everything which is different from ourselves, we clearly see that no extension, figure, change of position, nor any such thing which can be ascribed to body, constitutes our nature, but only thought alone; which is thus known earlier and more certainly than any corporeal thing.”[157] ‘I’ has thus significance here as thought, and not as individuality of self-consciousness. The second proposition of the Cartesian philosophy is hence the immediate certainty of thought. Certainty is only knowledge as such in its pure form as self-relating, and this is thought; thus then the unwieldy understanding makes its way on to the necessity of thought.

Descartes begins, just as Fichte did later on, with the ‘I’ as indubitably certain; I know that something is presented in me. By this Philosophy is at one stroke transplanted to quite another field and to quite another standpoint, namely to the sphere of subjectivity. Presuppositions in religion

are given up; proof alone is sought for, and not the absolute content which disappears before abstract infinite subjectivity. There is in Descartes likewise a seething desire to speak from strong feeling, from the ordinary sensuous point of view, just as Bruno and so many others, each in his own fashion, express as individualities their particular conceptions of the world. To consider the content in itself is not the first matter; for I can abstract from all my conceptions, but not from the 'I.' We think this and that, and hence it is — is to give the common would-be-wise argument of those incapable of grasping the matter in point; that a determinate content exists is exactly what we are forced to doubt — there is nothing absolutely fixed. Thought is the entirely universal, but not merely because I can abstract, but because 'I' is thus simple, self-identical. Thought consequently comes first; the next determination arrived at, in direct connection with it, is the determination of Being. The 'I think' directly involves my Being; this, says Descartes, is the absolute basis of all Philosophy.[158] The determination of Being is in my 'I'; this connection is itself the first matter. Thought as Being and Being as thought — that is my certainty, 'I'; in the celebrated *Cogito, ergo sum* we thus have Thought and Being inseparably bound together.

On the one hand this proposition is regarded as a syllogism: from thought Being is deduced. Kant more especially has objected to this that Being is not contained in thinking, that it is different from thinking. This is true, but they are still inseparable, or constitute an identity; their difference is not to the prejudice of their unity. Yet this maxim of pure abstract certainty, the universal totality in which everything implicitly exists, is not proved;[159] we must therefore not try to convert this proposition into a syllogism. Descartes himself says: "There is no syllogism present at all. For in order that there should be such, the major premise must have been 'all that thinks exists'" — from which the subsumption would have followed in

the minor premise, 'now I am.' By this the immediacy which rests in the proposition, would be removed. "But that major premise" is not set forth at all, being "really in the first instance derived from the original 'I think, therefore, I am.'"[160] For arriving at a conclusion three links are required — in this case we ought to have a third through which thought and Being should have been mediated, and it is not to be found here. The 'Therefore' which binds the two sides together is not the 'Therefore' of a syllogism; the connection between Being and Thought is only immediately posited. This certainty is thus the *prius*; all other propositions come later. The thinking subject as the simple immediacy of being-at-home-with-me is the very same thing as what is called Being; and it is quite easy to perceive this identity. As universal, thought is contained in all that is particular, and thus is pure relation to itself, pure oneness with itself. We must not make the mistake of representing Being to ourselves as a concrete content, and hence it is the same immediate identity which thought likewise is. Immediacy is, however, a one-sided determination; thought does not contain it alone, but also the determination to mediate itself with itself, and thereby — by the mediation being at the same time the abrogation of the mediation — it is immediacy. In thought we thus have Being; Being is, however, a poor determination, it is the abstraction from the concrete of thought. This identity of Being and Thought, which constitutes the most interesting idea of modern times, has not been further worked out by Descartes; he has relied on consciousness alone, and for the time being placed it in the fore-front. For with Descartes the necessity to develop the differences from the 'I think' is not yet present; Fichte first applied himself to the deduction of all determinations from this culminating point of absolute certainty.

Other propositions have been set against that of Descartes. Gassendi,[161] for example, asks if we might not just as well say *Ludificor, ergo sum*: I am made a fool of by my consciousness, therefore I exist — or properly

speaking, therefore I am made a fool of. Descartes himself recognized that this objection merited consideration, but he here repels it, inasmuch as it is the 'I' alone and not the other content which has to be maintained. Being alone is identical with pure thought, and not its content, be it what it may. Descartes further says: "By thought I, however, understand all that takes place in us within our consciousness, in as far as we are conscious of it; thus will, conception, and even feeling are identical with thought. For if I say 'I see,' or 'I walk out,' and 'therefore I am,' and understand by this the seeing and walking which is accomplished by the body, the conclusion is not absolutely certain, because, as often happens in a dream, I may imagine that I can see or walk even if I do not open my eyes nor move from my place, and I might also possibly do so supposing I had no body. But if I understand it of the subjective feeling or the consciousness of seeing or walking itself, because it is then related to the mind that alone feels or thinks that it sees or walks, this conclusion is perfectly certain."[162] "In a dream" is an empirical mode of reasoning, but there is no other objection to it. In willing, seeing, hearing, &c., thought is likewise contained, it is absurd to suppose that the soul has thinking in one special pocket, and seeing, willing, &c., in others. But if I say 'I see,' 'I walk out,' there is present on the one hand my consciousness 'I,' and consequently thought, on the other hand, however, there is present willing, seeing, hearing, walking, and thus a still further modification of the content. Now because of this modification I cannot say 'I walk, and therefore I am,' for I can undoubtedly abstract from the modification, since it is no longer universal Thought. Thus we must merely look at the pure consciousness contained in the concrete 'I.' Only when I accentuate the fact that I am present there as thinking, is pure Being implied, for only with the universal is Being united.

"In this it is implied," says Descartes, "that thought is more certain to me than body. If from the fact that I touch or see the earth I judge that it exists,

I must more certainly judge from this that my thought exists. For it may very well happen that I judge the earth to exist, even if it does not exist, but it cannot be that I judge this, and that my mind which judges this does not exist."[163] That is to say, everything which is for me I may assert to be non-existent, but when I assert myself to be non-existent, I myself *assert*, or it is *my* judgment. For I cannot set aside the fact that I judge, even if I can abstract from that respecting which I judge. In this Philosophy has regained its own ground that thought starts from thought as what is certain in itself, and not from something external, not from something given, not from an authority, but directly from the freedom that is contained in the 'I think.' Of all else I may doubt, of the existence of bodily things, of my body itself; or this certainty does not possess immediacy in itself. For 'I' is just certainty itself, but in all else this certainty is only predicate; my body is certain to *me*, it is not this certainty itself.[164] As against the certainty we feel of having a body, Descartes adduces the empirical phenomenon that we often hear of persons imagining they feel pain in a limb which they have lost long ago.[165] What is actual, he says is a substance, the soul is a thinking substance; it is thus for itself, separate from all external material things and independent. That it is thinking is evident from its nature: it would think and exist even if no material things were present; the soul can hence know itself more easily than its body.[166]

All else that we can hold as true rests on this certainty; for in order that anything should be held as true, evidence is requisite, but nothing is true which has not this inward evidence in consciousness. "Now the evidence of everything rests upon our perceiving it as clearly and vividly as that certainty itself, and on its so entirely depending from, and harmonizing with this principle, that if we wished to doubt it we should also have to doubt this principle likewise" (our *ego*).[167] This knowledge is indeed on its own

account perfect evidence, but it is not yet the truth, or if we take that Being as truth, it is an empty content, and it is with the content that we have to do.

c. What comes third is thus the transition of this certainty into truth, into the determinate; Descartes again makes this transition in a naïve way, and with it we for the first time begin to consider his metaphysics. What here takes place is that an interest arises in further representations and conceptions of the abstract unity of Being and Thought; there Descartes sets to work in an externally reflective manner. "The consciousness which merely knows itself to be certain now however seeks to extend its knowledge, and finds that it has conceptions of many things — in which conceptions it does not deceive itself, so long as it does not assert or deny that something similar outside corresponds to them." Deception in the conceptions has meaning only in relation to external existence. "Consciousness also discovers universal conceptions, and obtains from them proofs which are evident, *e.g.* the geometric proposition that the three angles of a triangle are together equal to two right angles is a conception which follows incontrovertibly from others. But in reflecting whether such things really exist doubts arise."[168] That there is such a thing as a triangle is indeed in this case by no means certain, since extension is not contained in the immediate certainty of myself. The soul may exist without the bodily element, and this last without it, they are in reality different; one is conceivable without the other. The soul thus does not think and know the other as clearly as the certainty of itself.[169]

Now the truth of all knowledge rests on the proof of the existence of God. The soul is an imperfect substance, but it has the Idea of an absolute perfect existence within itself; this perfection is not begotten in itself, just because it is an imperfect substance; this Idea is thus innate. In Descartes the consciousness of this fact is expressed by his saying that as long as the existence of God is not proved and perceived the possibility of our

deceiving ourselves remains, because we cannot know whether we do not possess a nature ordered and disposed to err (*supra*, p. 226).[170] The form is rather a mistaken one, and it only generally expresses the opposition in which self-consciousness stands to the consciousness of what is different, of the objective; and we have to deal with the unity of both — the question being whether what is in thought likewise possesses objectivity. This unity rests in God, or is God Himself. I shall put these assertions in the manner of Descartes: “Amongst these various conceptions possessed by us there likewise is the conception of a supremely intelligent, powerful, and absolutely perfect Being; and this is the most excellent of all conceptions.” This all-embracing universal conception has therefore this distinguishing feature, that in its case the uncertainty respecting Being which appears in the other conceptions, finds no place. It has the characteristic that “In it we do not recognize existence as something merely possible and accidental, as we do the conceptions of other things which we perceive clearly, but as a really essential and eternal determination. For instance, as mind perceives that in the conception of a triangle it is implied that the three angles are equal to two right angles, the triangle has them; and in the same way from the fact that mind perceives existence to be necessarily and eternally implied in the Notion of the most perfect reality, it is forced to conclude that the most perfect reality exists.”[171] For to perfection there likewise pertains the determination of existence, since the conception of a non-existent is less perfect. Thus we there have the unity of thought and Being, and the ontological proof of the existence of God; this we met with earlier (p. 63, *seq.*) in dealing with Anselm.

The proof of the existence of God from the Idea of Him is in this wise: In this Notion existence is implied; and therefore it is true. Descartes proceeds further in the same direction, in so far as after the manner of empirical axioms he sets forth: (α) “There are different degrees of reality or

entity, for the substance has more reality than the accident or the mode, and infinite substance has more than finite." (β) "In the Notion of a thing existence is implied, either the merely potential or the necessary," *i.e.* in the 'I' there is Being as the immediate certainty of an other-being, of the not-I opposed to the I. (γ) "No thing or no perfection of a thing which really exists *actu* can have the Nothing as original cause of its existence. For if anything could be predicated of nothing, thought could equally well be predicated of it, and I would thus say that I am nothing because I think." Descartes here arrives at a dividing line, at an unknown relationship; the Notion of cause is reached, and this is a thought indeed, but a determinate thought. Spinoza says in his explanation, "That the conceptions contain more or less reality, and those moments have just as much evidence as thought itself, because they not only say that we think, but how we think." These determinate modes as differences in the simplicity of thought, had, however, to be demonstrated. Spinoza adds to this step in advance that "The degrees of reality which we perceive in ideas are not in the ideas in as far as they are considered merely as kinds of thought, but in so far as the one represents a substance and the other a mere mode of substance, or, in a word, in so far as they are considered as conceptions of things." (δ) "The objective reality of Notions" (*i.e.*, the entity of what is represented in so far as it is in the Notion), "demands a first cause in which the same reality is contained not merely objectively" (that is to say in the Notion), "but likewise formally or even *eminenter* — formally, that is perfectly likewise: *eminenter*, more perfectly. For there must at least be as much in the cause as in the effect." (ε) "The existence of God is known immediately" — *a priori* — "from the contemplation of His nature. To say that anything is contained in the nature or in the Notion of a thing is tantamount to saying that it is true: existence is directly contained in the Notion of God. Hence it is quite true to say of Him that existence pertains of necessity to Him. There is

implied in the Notion of every particular thing either a possible or a necessary existence — a necessary existence in the Notion of God, *i.e.* of the absolutely perfect Being, for else He would be conceived as imperfect."[172]

Descartes likewise argues after this manner: "Problem: to prove *a posteriori* from the mere Notion within us the existence of God. The objective reality of a Notion demands a cause in which the same reality is not merely contained objectively" (as in the finite), "but formally" (freely, purely for itself, outside of us) "or *eminenter*" (as original). (Axiom δ.) "We now have a Notion of God, but His objective reality is neither formally nor *eminenter* contained within us, and it can thus be only in God Himself."[173] Consequently we see that with Descartes this Idea is an hypothesis. Now we should say we find this highest Idea in us. If we then ask whether this Idea exists, why, this is the Idea, that existence is asserted with it. To say that it is only a conception is to contradict the meaning of this conception. But here it is unsatisfactory to find that the conception is introduced thus: 'We have this conception,' and to find that it consequently appears like an hypothesis. In such a case it is not proved of this content in itself that it determines itself into this unity of thought and Being. In the form of God no other conception is thus here given than that contained in *Cogito, ergo sum*, wherein Being and thought are inseparably bound up — though now in the form of a conception which I possess within me. The whole content of this conception, the Almighty, All-wise, &c., are predicates which do not make their appearance until later; the content is simply the content of the Idea bound up with existence. Hence we see these determinations following one another in an empirical manner, and not philosophically proved — thus giving us an example of how in *a priori* metaphysics generally hypotheses of conceptions are brought in, and these become objects of thought, just as happens in empiricism with investigations, observations, and experiences.

Descartes then proceeds: “Mind is the more convinced of this when it notices that it discovers within itself the conception of no other thing wherein existence is necessarily implied. From this it will perceive that that idea of highest reality is not imagined by it, it is not chimerical, but a true and unalterable fact which cannot do otherwise than exist, seeing that existence is necessarily involved in it. Our prejudices hinder us from apprehending this with ease, for we are accustomed to distinguish in all other things the essence” (the Notion) “from the existence.” Respecting the assertion that thought is not inseparable from existence, the common way of talking is as follows: ‘If what men think really existed, things would be different.’ But in saying this men do not take into account that what is spoken of in this way is always a particular content, and that in it the essential nature of the finality of things simply signifies the fact that Notion and Being are separable. But how can one argue from finite things to the infinite? “This Notion,” Descartes continues, “is furthermore not made by us.” It is now declared to be an eternal truth which is revealed in us. “We do not find in ourselves the perfections which are contained in this conception. Thus we are certain that a first cause in which is all perfection, *i.e.* God as really existent, has given them to us; for it is certain to us that from nothing, nothing arises” (according to Boehme God derived the material of the world from Himself), “and what is perfect cannot be the effect of anything imperfect. From Him we must thus in true science deduce all created things.”[174] With the proof of the existence of God the validity of and evidence for all truth in its origin is immediately established. God as First Cause is Being-for-self, the reality which is not merely entity or existence in thought. An existence such as this first cause (which is not what we know as a thing) rests in the Notion of the not-I, not of each determinate thing — since these as determinate are negations — but only in the Notion of pure

existence or the perfect cause. It is the cause of the truth of ideas, for the aspect that it represents is that of their Being.

d. Fourthly, Descartes goes on to assert: "We must believe what is revealed to us by God, though we cannot understand it. It is not to be wondered at, since we are finite, that there is in God's nature as inconceivably infinite, what passes our comprehension." This represents the entrance of a very ordinary conception. Boehme on the other hand says (*supra*, p. 212): 'The mystery of the Trinity is ever born within us.' Descartes, however, concludes: "Hence we must not trouble ourselves with investigations respecting the infinite; for seeing that we are finite, it is absurd for us to say anything about it."[175] This matter we shall not, however, enter upon at present.

"Now the first attribute of God is that He is true and the Giver of all light; it is hence quite contrary to His nature to deceive us. Hence the light of nature or the power of acquiring knowledge given us by God can affect no object which is not really true in as far as it is affected by it" (the power of acquiring knowledge) "*i.e.* as it is perceived clearly and distinctly." We ascribe truth to God. From this Descartes goes on to infer the universal bond which exists between absolute knowledge and the objectivity of what we thus know. Knowledge has objects, has a content which is known; we call this connection truth. The truth of God is just this unity of what is thought by the subject or clearly perceived, and external reality or existence. "Thereby an end is put to doubt, as if it could be the case that what appears quite evident to us should not be really true. We can thus no longer have any suspicion of mathematical truths. Likewise if we give heed to what we distinguish by our senses in waking or in sleeping, clearly and distinctly, it is easy to recognize in each thing what in it is true." By saying that what is rightly and clearly thought likewise is, Descartes maintains that man comes to know by means of thought what in fact is in things; the

sources of errors lie on the other hand in the finitude of our nature. "It is certain, because of God's truth, that the faculty of perceiving and that of assenting through the will, if it extends no further than to that which is clearly perceived, cannot lead to error. Even if this cannot be in any way proved, it is by nature so established in all things, that as often as we clearly perceive anything, we assent to it from ourselves and can in no wise doubt that it is true."[176]

All this is set forth very plausibly, but it is still indeterminate, formal, and shallow; we only have the assertion made to us that this is so. Descartes' method is the method of the clear understanding merely. Certainty with him takes the first place; from it no content is deduced of necessity, no content generally, and still less its objectivity as distinguished from the inward subjectivity of the 'I.' At one time we have the opposition of subjective knowledge and actuality, and at another their inseparable union. In the first case the necessity of mediating them enters in, and the truth of God is asserted to be this mediating power. It consists in this, that His Notion contains reality immediately in itself. The proof of this unity then rests solely upon the fact of its being said that we find within us the idea of complete perfection; thus this conception here appears simply as one found ready to hand. With this is compared the mere conception of God which contains no existence within it, and it is found that without existence it would be imperfect. This unity of God Himself, of His Idea, with His existence, is undoubtedly the Truth; in this we find the ground for holding as true what is for us just as certain as the truth of ourselves. As Descartes proceeds further we thus find that in reality everything has truth for him only in so far as it is really an object of thought, a universal. This truth of God has been, as we shall see, expressed even more clearly and in a more concise way by a disciple of Descartes, if one may venture to call him so —

I mean Malebranche (who might really be dealt with here),[177] in his *Recherche de la vérité*.

The first of the fundamental determinations of the Cartesian metaphysics is from the certainty of oneself to arrive at the truth, to recognize Being in the Notion of thought. But because in the thought "I think," I am an individual, thought comes before my mind as subjective; Being is hence not demonstrated in the Notion of thought itself, for what advance has been made is merely in the direction of separation generally. In the second place the negative of Being likewise comes before self-consciousness, and this negative, united with the positive I, is so to speak implicitly united in a third, in God. God, who before this was a non-contradictory potentiality, now takes objective form to self-consciousness, He is all reality in so far as it is positive, *i.e.* as it is Being, unity of thought and Being, the highest perfection of existence; it is just in the negative, in the Notion of this, in its being an object of thought, that Being is contained. An objection to this identity is now old — Kant urged it likewise — that from the Notion of the most perfect existence more does not follow than that *in* thought existence here and now and the most perfect essence are conjoined, but not *outside* of thought. But the very Notion of present existence is this negative of self-consciousness, not out of thought, — but the thought of the 'out of thought.'

2. Descartes accepts Being in the entirely positive sense, and has not the conception of its being the negative of self-consciousness: but simple Being, set forth as the negative of self-consciousness, is extension. Descartes thus separates extension from God, remains constant to this separation, unites the universe, matter, with God in such a way as to make Him its creator and first cause: and he has the true perception that conservation is a continuous creation, in so far as creation as activity is asserted to be separated. Descartes does not, however, trace extension in a true method back to thought; matter, extended substances, stand over

against the thinking substances which are simple; in as far as the universe is created by God, it could not be as perfect as its cause. As a matter of fact the effect is less perfect than the cause, since it is that which is posited, if we are to remain at the conception of cause pertaining to the understanding. Hence according to Descartes extension is the less perfect. But as imperfect the extended substances cannot exist and subsist through themselves or their Notion; they thus require every moment the assistance of God for their maintenance, and without this they would in a moment sink back into nothing. Preservation is, however, unceasing reproduction.[178]

Descartes now proceeds to further particulars, and expresses himself as follows: "We consider what comes under consciousness either as things or their qualities, or as eternal truths which have no existence outside our thought" — which do not belong to this or that time, to this or that place. He calls those last something inborn within us, something not made by us or merely felt,[179] but the eternal Notion of mind itself and the eternal determinations of its freedom, of itself as itself. From this point the conception that ideas are inborn (*innatæ ideæ*) hence proceeds; this is the question over which Locke and Leibnitz dispute. The expression "eternal truths" is current even in these modern times, and it signifies the universal determinations and relations which exist entirely on their own account. The word 'inborn' is however a clumsy and stupid expression, because the conception of physical birth thereby indicated, does not apply to mind. To Descartes inborn ideas are not universal, as they are to Plato and his successors, but that which has evidence, immediate certainty, an immediate multiplicity founded in thought itself — manifold conceptions in the form of a Being, resembling what Cicero calls natural feelings implanted in the heart. We would rather say that such is implied in the nature and essence of our mind and spirit. Mind is active and conducts itself in its activity in a determinate manner; but this activity has no other ground than its freedom.

Yet if this is the case more is required than merely to say so; it must be deduced as a necessary product of our mind. We have such ideas, for instance, in the logical laws: “From nothing comes nothing,” “A thing cannot both be and not be,”[180] as also in moral principles. These are facts of consciousness which Descartes however soon passes from again; they are only present in thought as subjective, and he has thus not yet inquired respecting their content.

As regards things, on which Descartes now directs his attention, the other side to these eternal verities, the universal determinations of things are substance, permanence, order, &c.[181] He then gives definitions of these thoughts, just as Aristotle draws up a list of the categories. But although Descartes laid it down formerly as essential that no hypotheses must be made, yet now he takes the conceptions, and passes on to them as something found within our consciousness. He defines substance thus: “By substance I understand none other than a thing (*rem*) which requires no other something for existence; and there is only one thing, namely God, which can be regarded as such a substance requiring no other thing.” This is what Spinoza says; we may say that it is likewise the true definition, the unity of Notion and reality: “All other” (things) “can only exist by means of a concurrence (*concursus*) of God”; what we still call substance outside of God thus does not exist for itself, does not have its existence in the Notion itself. That is then called the system of assistance (*systema assistentiæ*) which is, however, transcendental. God is the absolute uniter of Notion and actuality; other things, finite things which have a limit and stand in dependence, require something else. “Hence if we likewise call other things substances, this expression is not applicable both to them and to God *univoce*, as is said in the schools; that is to say no definite significance can be given to this word which would equally apply both to God and to the creatures.”[182]

“But I do not recognize more than two sorts of things; the one is that of thinking things, and the other that of things which relate to what is extended.” Thought, the Notion, the spiritual, the self-conscious, is what is at home with itself, and its opposite is contained in what is extended, spatial, separated, not at home with itself nor free. This is the real distinction (*distinctio realis*) of substances: “The one substance can be clearly and definitely comprehended without the other. But the corporeal and the thinking and creating substance can be comprehended under this common notion, for the reason that they are things which require God’s support alone in order to exist.” They are universal; other finite things require other things as conditions essential to their existence. But extended substance, the kingdom of nature, and spiritual substance, do not require one another.[183] They may be called substances, because each of them constitutes an entire range or sphere, an independent totality. But because, Spinoza concluded, each side, the kingdom of thought as well as nature, is one complete system within itself, they are likewise in themselves, that is absolutely, identical as God, the absolute substance; for thinking spirit this implicit is thus God, or their differences are ideal.

Descartes proceeds from the Notion of God to what is created, to thought and extension, and from this to the particular. “Now substances have several attributes without which they cannot be thought” — that signifies their determinateness— “but each has something peculiar to itself which constitutes its nature and essence” — a simple universal determinateness— “and to which the others all relate. Thus thought constitutes the absolute attribute of mind,” thought is its quality; “extension is” the essential determination of corporeality, and this alone is “the true nature of body. What remains are merely secondary qualities, modes, like figure and movement in what is extended, imagination, feeling and will in thinking;

they may be taken away or thought away. God is the uncreated, thinking substance."[184]

Descartes here passes to what is individual, and because he follows up extension he arrives at matter, rest, movement. One of Descartes' main points is that matter, extension, corporeality, are quite the same thing for thought; according to him the nature of body is fulfilled in its extension, and this should be accepted as the only essential fact respecting the corporeal world. We say that body offers resistance, has smell, taste, colour, transparency, hardness, &c., since without these we can have no body. All these further determinations respecting what is extended, such as size, rest, movement, and inertia, are, however, merely sensuous, and this Descartes showed, as it had long before this been shown by the Sceptics. Undoubtedly that is the abstract Notion or pure essence, but to body or to pure existence, there likewise of necessity pertains negativity or diversity. By means of the following illustration Descartes showed that with the exception of extension, all corporeal determinations may be annihilated, and that none can be absolutely predicated. We draw conclusions respecting the solidity and hardness of matter from the resistance which a body offers to our disturbance, and by means of which it seeks to hold its place. Now if we admit that matter as we touch it always gives way to us like space, we should have no reason for ascribing to it solidity. Smell, colour, taste, are in the same way sensuous qualities merely; but what we clearly perceive is alone true. If a body is ground into small parts, it gives way, and yet it does not lose its nature; resistance is thus not essential.[185] This not-being-for-itself is however a quantitatively slighter resistance only; the resistance always remains. But Descartes desires only to think; now he does not think resistance, colour, &c., but apprehends them by the senses only. Hence he says that all this must be led back to extension as being special modifications of the same. It is undoubtedly to the credit of Descartes that

he only accepts as true what is thought; but the abrogation of these sensuous qualities simply represents the negative movement of thought: the essence of body is conditioned through this thought, that is, it is not true essence.

Descartes now makes his way from the Notion of extension to the laws of motion, as the universal knowledge of the corporeal in its implicitude; he shows (α) that there is no vacuum, for that would be an extension without bodily substance, *i.e.* a body without body; (β) that there are no atoms (no indivisible independent existence), for the same reason, viz., because the essence of body is extension. (γ) He further shows that a body is set in motion by something outside of it, but of itself it continues in a condition of rest, and likewise it must, when in a condition of movement, be brought to rest by another outside of it — this is the property of inertia.[186] These are unmeaning propositions, for an abstraction is involved for instance in asserting simple rest and movement in their opposition.

Extension and motion are the fundamental conceptions in mechanical physics; they represent the truth of the corporeal world. It is thus that ideality comes before the mind of Descartes, and he is far elevated above the reality of the sensuous qualities, although he does not reach so far as to the separation of this ideality. He thus remains at the point of view of mechanism pure and simple. Give me matter (extension) and motion and I will build worlds for you, is what Descartes virtually says.[187] Space and time were hence to him the only determinations of the material universe. In this, then, lies the mechanical fashion of viewing nature, or the natural philosophy of Descartes is seen to be purely mechanical.[188] Hence changes in matter are due merely to motion, so that Descartes traces every relationship to the rest and movement of particles, and all material diversity such as colour, and taste — in short, all bodily qualities and animal phenomena — to mechanism. In living beings processes such as that of

digestion are mechanical effects which have as principles, rest and movement. We here see the ground and origin of the mechanical philosophy; but further on we find that this is unsatisfactory, for matter and motion do not suffice to explain life. Yet the great matter in all this is that thought goes forward in its determinations, and that it constitutes from these thought-determinations the truth of nature.

In his consideration of the system of the world and the movement of the heavenly bodies, Descartes has worked out the mechanical view more fully. He thus comes to speak of the earth, the sun, &c., and of his conception of the circling motion of the heavenly bodies in the form of vortices: of metaphysical hypotheses as to how small particles pass into, out of, and through pores and act on one another; and finally to saltpetre and gunpowder.[189]

Universal reflections should have the first claim on our attention; but on the other hand the transition to the determinate is accomplished in a system of Physics which is the result of observations and experiences, and this is done entirely by means of the understanding. Descartes thus mingles many observations with a metaphysic of this nature, and to us the result is hence obscure. In this philosophy the thinking treatment of empiricism is thus predominant, and a similar method has been adopted by philosophers from this time on. To Descartes and others, Philosophy had still the more indefinite significance of arriving at knowledge through thought, reflection, and reasoning. Speculative cognition, the derivation from the Notion, the free independent development of the matter itself, was first introduced by Fichte, and consequently what is now called philosophic knowledge is not yet separated in Descartes from the rest of scientific knowledge. In those times all the knowledge of mankind was called philosophy; in Descartes' metaphysics we thus saw quite empirical reflection and reasoning from particular grounds, from experiences, facts, phenomena, being brought into

play in the naivest manner, and one has no sense of speculation in the matter. The strictly scientific element here really consisted mainly in the method of proof as it has long been made use of in geometry, and in the ordinary method of the formal logical syllogism. Hence it likewise happens that Philosophy, which ought to form a totality of the sciences, begins with logic and metaphysics; the second part is composed of ordinary physics and mathematics, mingled no doubt with metaphysical speculations, and the third part, ethics, deals with the nature of man, his duties, the state, the citizen. And this is the case with Descartes. The first part of the *Principia philosophiæ* treats *De principiis cognitionis humanæ*, the second *De principiis rerum materialium*. This natural philosophy, as a philosophy of extension, is, however, none other than what a quite ordinary physics or mechanics might at that time be, and it is still quite hypothetical; we, on the other hand, accurately distinguish empirical physics and natural philosophy, even though the first likewise pertains to thought.

3. Descartes never reached the third part, the philosophy of Mind, for, while he made a special study of physics, in the region of ethics he published one tract only, *De passionibus*. In this reference Descartes treats of thought and human freedom. He proves freedom from the fact of the soul thinking that the will is unrestrained, and of that constituting the perfection of mankind. And this is quite true. In respect to the freedom of the will he comes across the difficulty of how to reconcile it with the divine prescience. As free, man might do what is not ordained of God beforehand — this would conflict with the omnipotence and omniscience of God; and if everything is ordained of God, human freedom would thereby be done away with. Yet he does not solve the contradiction contained in these two different aspects without falling into difficulty. But conformably to the method which he adopts, and which we pointed out above (pp. 238, 239), he says: “The human mind is finite, God’s power and predetermination are

infinite; we are thus not capable of judging of the relationship in which the freedom of the human soul stands to the omnipotence and omniscience of God — but in self-consciousness we have the certainty of it given us as a fact. And we must hold only to what is certain."[190] When he proceeds further much appears to him still incapable of explanation; but we see obstinacy and caprice likewise exhibited in his stopping short at the assertion as to the best of his knowledge. The method of knowledge as set forth by Descartes, takes the form of a reasoning of the understanding, and is thus without special interest.

These, then, are the principal points in the Cartesian system. Some particular assertions made by Descartes, which have been specially instrumental in giving him fame, have still to be mentioned — particular forms which have been formerly considered in metaphysics, and likewise by Wolff. For example, in the first place we gather that Descartes regarded animals and other organisms as machines moved by another, and not possessing the principle of the spontaneity of thought within them[191] — a mechanical physiology, a cut and dry thought pertaining to the understanding, which is of no further importance. In the sharp opposition between thought and extension, the former is not considered as sensation, so that the latter can isolate itself. The organic must as body reduce itself to extension; any further development of this last thus only proves its dependence on the first determinations.

In the second place, the relation between soul and body now becomes an important question, that is, the return of the object within itself in such a way that thought posits itself in another, in matter. As to this, many systems are offered to us in metaphysics. One of these is the *influxus physicus*, that the relation of spirit is of a corporeal nature, that the object is related to mind as bodies are to one another — a conception like this is very crude. How does Descartes understand the unity of soul and body? The former

belongs to thought, the latter to extension; and thus because both are substance, neither requires the Notion of the other, and hence soul and body are independent of one another and can exercise no direct influence upon one another. Soul could only influence body in so far as it required the same, and conversely — that is, in so far as they have actual relation to one another. But since each is a totality, neither can bear a real relation to the other. Descartes consistently denied the physical influence of one on the other; that would have signified a mechanical relation between the two. Descartes thus established the intellectual sphere in contradistinction to matter, and on it based the independent subsistence of mind; for in his *cogito* 'I' is at first only certain of itself, since I can abstract from all. Now we find the necessity of a mediator to bring about a union of the abstract and the external and individual. Descartes settles this by placing between the two what constitutes the metaphysical ground of their mutual changes, God. He is the intermediate bond of union, in as far as He affords assistance to the soul in what it cannot through its own freedom accomplish, so that the changes in body and soul may correspond with one another.[192] If I have desires, an intention, these receive corporeal realization; this association of soul and body is, according to Descartes, effected through God. For above (p. 239) we saw that Descartes says of God that He is the Truth of the conception: as long as I think rightly and consistently, something real corresponds to my thought, and the connecting link is God. God is hereby the perfect identity of the two opposites, since He is, as Idea, the unity of Notion and reality. In the Idea of Spinoza this is worked out and developed in its further moments. Descartes' conclusion is quite correct; in finite things this identity is imperfect. Only the form employed by Descartes is inadequate; for it implies that in the beginning there are two things, thought or soul and body, and that then God appears as a third thing, outside both — that He is not the Notion of unity, nor are the two elements themselves

Notion. We must not however forget that Descartes says that both those original elements are created substances. But this expression ‘created’ pertains to the ordinary conception only and is not a determinate thought; it was Spinoza, therefore, who first accomplished this return to thought.

2. Spinoza.

The philosophy of Descartes underwent a great variety of unspeculative developments, but in Benedict Spinoza a direct successor to this philosopher may be found, and one who carried on the Cartesian principle to its furthest logical conclusions. For him soul and body, thought and Being, cease to have separate independent existence. The dualism of the Cartesian system Spinoza, as a Jew, altogether set aside. For the profound unity of his philosophy as it found expression in Europe, his manifestation of Spirit as the identity of the finite and the infinite in God, instead of God’s appearing related to these as a Third — all this is an echo from Eastern lands. The Oriental theory of absolute identity was brought by Spinoza much more directly into line, firstly with the current of European thought, and then with the European and Cartesian philosophy, in which it soon found a place.

First of all we must, however, glance at the circumstances of Spinoza’s life. He was by descent a Portuguese Jew, and was born at Amsterdam in the year 1632; the name he received was Baruch, but he altered it to Benedict. In his youth he was instructed by the Rabbis of the synagogue to which he belonged, but he soon fell out with them, their wrath having been kindled by the criticisms which he passed on the fantastic doctrines of the Talmud. He was not, therefore, long in absenting himself from the synagogue, and as the Rabbis were in dread lest his example should have evil consequences, they offered him a yearly allowance of a thousand gulden if he would keep away from the place and hold his tongue. This

offer he declined; and the Rabbis thereafter carried their persecution of him to such a pitch that they were even minded to rid themselves of him by assassination. After having made a narrow escape from the dagger, he formally withdrew from the Jewish communion, without, however, going over to the Christian Church. He now applied himself particularly to the Latin language, and made a special study of the Cartesian philosophy. Later on he went to Rhynsburg, near Leyden, and from the year 1664 he lived in retirement, first at Voorburg, a village near the Hague, and then at the Hague itself, highly respected by numerous friends: he gained a livelihood for himself by grinding optical glasses. It was no arbitrary choice that led him to occupy himself with light, for it represents in the material sphere the absolute identity which forms the foundation of the Oriental view of things. Although he had rich friends and mighty protectors, among whom even generals were numbered, he lived in humble poverty, declining the handsome gifts offered to him time after time. Nor would he permit Simon von Vries to make him his heir; he only accepted from him an annual pension of three hundred florins; in the same way he gave up to his sisters his share of their father's estate. From the Elector Palatine, Carl Ludwig, a man of most noble character and raised above the prejudices of his time, he received the offer of a professor's chair at Heidelberg, with the assurance that he would have liberty to teach and to write, because "the Prince believed he would not put that liberty to a bad use by interfering with the religion publicly established." Spinoza (in his published letters) very wisely declined this offer, however, because "he did not know within what limits that philosophic liberty would have to be confined, in order that he might not appear to be interfering with the publicly established religion." He remained in Holland, a country highly interesting in the history of general culture, as it was the first in Europe to show the example of universal toleration, and afforded to many a place of refuge where they might enjoy

liberty of thought; for fierce as was the rage of the theologians there against Bekker, for example (Bruck. Hist. crit. phil. T. IV. P. 2, pp. 719, 720), and furious as were the attacks of Voetius on the Cartesian philosophy, these had not the consequences which they would have had in another land. Spinoza died on the 21st of February, 1677, in the forty-fourth year of his age. The cause of his death was consumption, from which he had long been a sufferer; this was in harmony with his system of philosophy, according to which all particularity and individuality pass away in the one substance. A Protestant divine, Colerus by name, who published a biography of Spinoza, inveighs strongly against him, it is true, but gives nevertheless a most minute and kindly description of his circumstances and surroundings — telling how he left only about two hundred thalers, what debts he had, and so on. A bill included in the inventory, in which the barber requests payment due him by M. Spinoza of blessed memory, scandalizes the parson very much, and regarding it he makes the observation: "Had the barber but known what sort of a creature Spinoza was, he certainly would not have spoken of his blessed memory." The German translator of this biography writes under the portrait of Spinoza: *characterem, reprobationis in vultu gerens*, applying this description to a countenance which doubtless expresses the melancholy of a profound thinker, but is otherwise mild and benevolent. The *reprobatio* is certainly correct; but it is not a reprobation in the passive sense; it is an active disapprobation on Spinoza's part of the opinions, errors and thoughtless passions of mankind.[193]

Spinoza used the terminology of Descartes, and also published an account of his system. For we find the first of Spinoza's works entitled "An Exposition according to the geometrical method of the principles of the Cartesian philosophy." Some time after this he wrote his *Tractatus theologico-politicus*, and by it gained considerable reputation. Great as was

the hatred which Spinoza roused amongst his Rabbis, it was more than equalled by the odium which he brought upon himself amongst Christian, and especially amongst Protestant theologians — chiefly through the medium of this essay. It contains his views on inspiration, a critical treatment of the books of Moses and the like, chiefly from the point of view that the laws therein contained are limited in their application to the Jews. Later Christian theologians have written critically on this subject, usually making it their object to show that these books were compiled at a later time, and that they date in part from a period subsequent to the Babylonian captivity; this has become a crucial point with Protestant theologians, and one by which the modern school distinguishes itself from the older, greatly pluming itself thereon. All this, however, is already to be found in the above-mentioned work of Spinoza. But Spinoza drew the greatest odium upon himself by his philosophy proper, which we must now consider as it is given to us in his Ethics. While Descartes published no writings on this subject, the Ethics of Spinoza is undoubtedly his greatest work; it was published after his death by Ludwig Mayer, a physician, who had been Spinoza's most intimate friend. It consists of five parts; the first deals with God (*De Deo*). General metaphysical ideas are contained in it, which include the knowledge of God and nature. The second part deals with the nature and origin of mind (*De natura et origine mentis*). We see thus that Spinoza does not treat of the subject of natural philosophy, extension and motion at all, for he passes immediately from God to the philosophy of mind, to the ethical point of view; and what refers to knowledge, intelligent mind, is brought forward in the first part, under the head of the principles of human knowledge. The third book of the Ethics deals with the origin and nature of the passions (*De origine et natura affectuum*); the fourth with the powers of the same, or human slavery (*De servitute humana seu de affectuum viribus*); the fifth, lastly, with the power of the understanding,

with thought, or with human liberty (*De potentia intellectus seu de libertate humana*).[194] Kirchenrath Professor Paulus published Spinoza's works in Jena; I had a share in the bringing out of this edition, having been entrusted with the collation of French translations.

As regards the philosophy of Spinoza, it is very simple, and on the whole easy to comprehend; the difficulty which it presents is due partly to the limitations of the method in which Spinoza presents his thoughts, and partly to his narrow range of ideas, which causes him in an unsatisfactory way to pass over important points of view and cardinal questions. Spinoza's system is that of Descartes made objective in the form of absolute truth. The simple thought of Spinoza's idealism is this: The true is simply and solely the one substance, whose attributes are thought and extension or nature: and only this absolute unity is reality, it alone is God. It is, as with Descartes, the unity of thought and Being, or that which contains the Notion of its existence in itself. The Cartesian substance, as Idea, has certainly Being included in its Notion; but it is only Being as abstract, not as real Being or as extension (*supra*, p. 241). With Descartes corporeality and the thinking 'I' are altogether independent Beings; this independence of the two extremes is done away with in Spinozism by their becoming moments of the one absolute Being. This expression signifies that Being must be grasped as the unity of opposites; the chief consideration is not to let slip the opposition and set it aside, but to reconcile and resolve it. Since then it is thought and Being, and no longer the abstractions of the finite and infinite, or of limit and the unlimited, that form the opposition (*supra*, p. 161), Being is here more definitely regarded as extension; for in its abstraction it would be really only that return into itself, that simple equality with itself, which constitutes thought (*supra*, p. 229). The pure thought of Spinoza is therefore not the simple universal of Plato, for it has likewise come to know the absolute opposition of Notion and Being.

Taken as a whole, this constitutes the Idea of Spinoza, and it is just what τὸ ὄν was to the Eleatics (Vol. I. pp. 244, 252). This Idea of Spinoza's we must allow to be in the main true and well-grounded; absolute substance is the truth, but it is not the whole truth; in order to be this it must also be thought of as in itself active and living, and by that very means it must determine itself as mind. But substance with Spinoza is only the universal and consequently the abstract determination of mind; it may undoubtedly be said that this thought is the foundation of all true views — not, however, as their absolutely fixed and permanent basis, but as the abstract unity which mind is in itself. It is therefore worthy of note that thought must begin by placing itself at the standpoint of Spinozism; to be a follower of Spinoza is the essential commencement of all Philosophy. For as we saw above (Vol I. p. 144), when man begins to philosophize, the soul must commence by bathing in this ether of the One Substance, in which all that man has held as true has disappeared; this negation of all that is particular, to which every philosopher must have come, is the liberation of the mind and its absolute foundation. The difference between our standpoint and that of the Eleatic philosophy is only this, that through the agency of Christianity concrete individuality is in the modern world present throughout in spirit. But in spite of the infinite demands on the part of the concrete, substance with Spinoza is not yet determined as in itself concrete. As the concrete is thus not present in the content of substance, it is therefore to be found within reflecting thought alone, and it is only from the endless oppositions of this last that the required unity emerges. Of substance as such there is nothing more to be said; all that we can do is to speak of the different ways in which Philosophy has dealt with it, and the opposites which in it are abrogated. The difference depends on the nature of the opposites which are held to be abrogated in substance. Spinoza is far from having proved this unity as convincingly as was done by the ancients; but what constitutes the grandeur

of Spinoza’s manner of thought is that he is able to renounce all that is determinate and particular, and restrict himself to the One, giving heed to this alone.

1. Spinoza begins (Eth. P. I pp. 35, 36) with a series of definitions, from which we take the following.

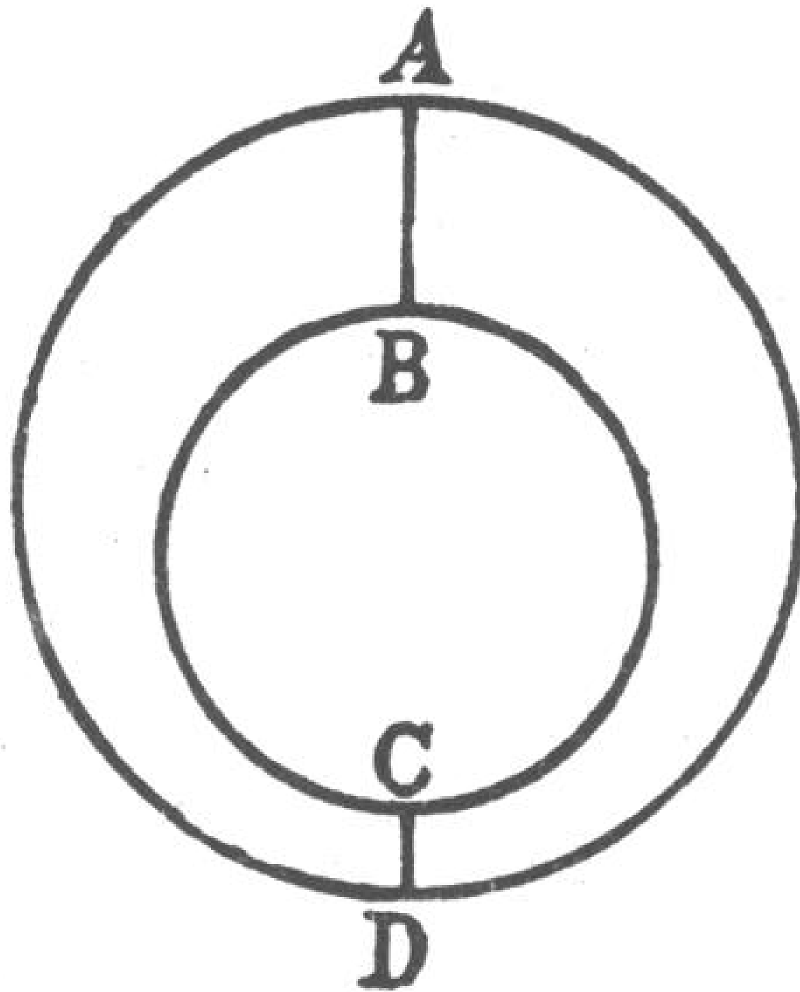
a. Spinoza’s first definition is of the Cause of itself. He says: “By that which is *causa sui*, its own cause, I understand that whose essence” (or Notion) “involves existence, or which cannot be conceived except as existent.” The unity of existence and universal thought is asserted from the very first, and this unity will ever be the question at issue. “The cause of itself” is a noteworthy expression, for while we picture to ourselves that the effect stands in opposition to the cause, the cause of itself is the cause which, while it operates and separates an “other,” at the same time produces only itself, and in the production therefore does away with this distinction. The establishing of itself as an other is loss or degeneration, and at the same time the negation of this loss; this is a purely speculative Notion, indeed a fundamental Notion in all speculation. The cause in which the cause is identical with the effect, is the infinite cause (*infra*, p. 263); if Spinoza had further developed what lies in the *causa sui*, substance with him would not have been rigid and unworkable.

b. The second definition is that of the finite. “That thing is said to be finite in its kind which can be limited by another of the same nature,” For it comes then to an end, it is not there; what is there is something else. This something else must, however, be of a like nature; for those things which are to limit each other must, in order to be able to limit each other, touch each other, and consequently have a relation to each other, that is to say they must be of one nature, stand on a like basis, and have a common sphere. That is the affirmative side of the limit. “Thus a thought is” only “limited by another thought, a body by another body, but thoughts are not

limited by bodies nor” conversely “bodies by thoughts.” We saw this (p. 244) with Descartes: thought is an independent totality and so is extension, they have nothing to do with one another; they do not limit each other, each is included in itself.

c. The third definition is that of substance. “By substance I understand that which exists in itself and is conceived by itself, *i.e.* the conception of which does not require the aid of the conception of any other thing for its formation (*a quo formari debeat*);” otherwise it would be finite, accidental. What cannot have a conception formed of it without the aid of something else, is not independent, but is dependent upon that something else.

d. In the fourth place Spinoza defines attributes, which, as the moment coming second to substance, belong to it. “By attribute I understand that which the mind perceives as constituting the essence of substance;” and to Spinoza this alone is true. This is an important determination; the attribute is undoubtedly a determinateness, but at the same time it remains a totality. Spinoza, like Descartes, accepts only two attributes, thought and extension. The understanding grasps them as the reality of substance, but the reality is not higher than the substance, for it is only reality in the view of the understanding, which falls outside substance. Each of the two ways of regarding substance — extension and thought — contains no doubt the whole content of substance, but only in one form, which the understanding brings with it; and for this very reason both sides are in themselves identical and infinite. This is the true completion; but where substance passes over into attribute is not stated.



e. The fifth definition has to do with what comes third in relation to substance, the mode. “By mode I understand the affections of substance, or that which is in something else, through the aid of which also it is conceived.” Thus substance is conceived through itself; attribute is not conceived through itself, but has a relation to the conceiving understanding,

in so far as this last conceives reality; mode, finally, is what is not conceived as reality, but through and in something else.

These last three moments Spinoza ought not merely to have established in this way as conceptions, he ought to have deduced them; they are especially important, and correspond with what we more definitely distinguish as universal, particular and individual. They must not, however, be taken as formal, but in their true concrete sense; the concrete universal is substance, the concrete particular is the concrete species; the Father and Son in the Christian dogma are similarly particular, but each of them contains the whole nature of God, only under a different form. The mode is the individual, the finite as such, which enters into external connection with what is "other." In this Spinoza only descends to a lower stage, the mode is only the foregoing warped and stunted. Spinoza's defect is therefore this, that he takes the third moment as mode alone, as a false individuality. True individuality and subjectivity is not a mere retreat from the universal, not merely something clearly determinate; for, as clearly determinate, it is at the same time Being-for-itself, determined by itself alone. The individual, the subjective, is even in being so the return to the universal; and in that it is at home with itself, it is itself the universal. The return consists simply and solely in the fact of the particular being in itself the universal; to this return Spinoza did not attain. Rigid substantiality is the last point he reached, not infinite form; this he knew not, and thus determinateness continually vanishes from his thought.

f. In the sixth place, the definition of the infinite is also of importance, for in the infinite Spinoza defines more strictly than anywhere else the Notion of the Notion. The infinite has a double significance, according as it is taken as the infinitely many or as the absolutely infinite (*infra*, p. 263). "The infinite in its kind is not such in respect of all possible attributes; but the absolutely infinite is that to whose essence all belongs that expresses an

essence and contains no negation.” In the same sense Spinoza distinguishes in the nine-and-twentieth Letter (Oper. T. I. pp. 526-532) the infinite of imagination from the infinite of thought (*intellectus*), the actual (*actu*) infinite. Most men, when they wish to strive after the sublime, get no farther than the first of these; this is the false infinite, just as when one says “and so on into infinity,” meaning perhaps the infinity of space from star to star, or else the infinity of time. An infinite numerical series in mathematics is exactly the same thing. If a certain fraction is represented as a decimal fraction, it is incomplete; $1/7$\u2150 is, on the contrary, the true infinite, and therefore not an incomplete expression, although the content here is of course limited. It is infinity in the incorrect sense that one usually has in view when infinity is spoken of; and even if it is looked on as sublime, it yet is nothing present, and only goes ever out into the negative, without being actual (*actu*). But for Spinoza the infinite is not the fixing of a limit and then passing beyond the limit fixed — the sensuous infinity — but absolute infinity, the positive, which has complete and present in itself an absolute multiplicity which has no Beyond. Philosophic infinity, that which is infinite *actu*, Spinoza therefore calls the absolute affirmation of itself. This is quite correct, only it might have been better expressed as: “It is the negation of negation.” Spinoza here also employs geometrical figures as illustrations of the Notion of infinity. In his *Opera postuma*, preceding his Ethics, and also in the letter quoted above, he has two circles, one of which lies within the other, which have not, however, a common centre.

“The inequalities of the space between A B and C D exceed every number; and yet the space which lies between is not so very great.” That is to say, if I wish to determine them all, I must enter upon an infinite series. This “beyond” always, however, remains defective, is always affected with negation; and yet this false infinite is there to hand, circumscribed, affirmative, actual and present in that plane as a complete space between the two circles. Or a finite line consists of an infinite number of points; and yet the line is present here and determined; the “beyond” of the infinite number of points, which are not complete, is in it complete and called back into unity. The infinite should be represented as actually present, and this comes to pass in the Notion of the cause of itself, which is therefore the true

infinity. As soon as the cause has something else opposed to it — the effect — finitude is present; but here this something else is at the same time abrogated and it becomes once more the cause itself. The affirmative is thus negation of negation, since, according to the well-known grammatical rule, *duplex negatio affirmat*. In the same way Spinoza's earlier definitions have also the infinite already implied in them, for instance in the case of the just mentioned cause of itself, inasmuch as he defines it as that whose essence involves existence (*supra*, p. 258). Notion and existence are each the Beyond of the other; but cause of itself, as thus including them, is really the carrying back of this "beyond" into unity. Or (*supra*, p. 259) "Substance is that which is in itself and is conceived from itself;" that is the same unity of Notion and existence. The infinite is in the same way in itself and has also its Notion in itself; its Notion is its Being, and its Being its Notion; true infinity is therefore to be found in Spinoza. But he has no consciousness of this; he has not recognized this Notion as absolute Notion, and therefore has not expressed it as a moment of true existence; for with him the Notion falls outside of existence, into the thought of existence.

g. Finally Spinoza says in the seventh place: "God is a Being absolutely infinite, *i.e.* a substance consisting of infinite attributes, each of which expresses an eternal and infinite essence." Does substance, one might here ask, possess an infinite number of attributes? But as with Spinoza there are only two attributes, thought and extension, with which he invests God, "infinite" is not to be taken here in the sense of the indeterminate many, but positively, as a circle is perfect infinity in itself.

The whole of Spinoza's philosophy is contained in these definitions, which, however, taken as a whole are formal; it is really a weak point in Spinoza that he begins thus with definitions. In mathematics this method is permitted, because at the outset we there make assumptions, such as that of the point and line; but in Philosophy the content should be known as the

absolutely true. It is all very well to grant the correctness of the name-definition, and acknowledge that the word “substance” corresponds with the conception which the definition indicates, but it is quite another question to determine whether this content is absolutely true. Such a question is not asked in the case of geometrical propositions, but in philosophic investigation it is the very thing to be first considered, and this Spinoza has not done. Instead of only explaining these simple thoughts and representing them as concrete in the definitions which he makes, what he ought to have done was to examine whether this content is true. To all appearance it is only the explanation of the words that is given; but the content of the words is held to be established. All further content is merely derived from that, and proved thereby; for on the first content all the rest depends, and if it is established as a basis, the other necessarily follows. “The attribute is that which the understanding thinks of God.” But here the question is: How does it come that besides the Deity there now appears the understanding, which applies to absolute substance the two forms of thought and extension? and whence come these two forms themselves? Thus everything proceeds inwards, and not outwards; the determinations are not developed from substance, it does not resolve itself into these attributes.

2. These definitions are followed by axioms and propositions in which Spinoza proves a great variety of points. He descends from the universal of substance through the particular, thought and extension, to the individual. He has thus all three moments of the Notion, or they are essential to him. But the mode, under which head falls individuality, he does not recognize as essential, or as constituting a moment of true existence in that existence; for it disappears in existence, or it is not raised into the Notion.

a. The main point then is that Spinoza proves from these Notions that there is only One Substance, God. It is a simple chain of reasoning, a very formal proof. “Fifth Proposition: There cannot be two or more substances of

the same nature or of the same attribute.” This is implied already in the definitions; the proof is therefore a useless and wearisome toil, which only serves to render Spinoza more difficult to understand. “If there were several” (substances of the same attribute) “they must be distinguished from one another either by the diversity of their attributes or by the diversity of their affections” (modes). “If they are distinguished by their attributes, it would be directly conceded that there is only one substance having the same attribute.” For the attributes are simply what the understanding grasps as the essence of the one substance, which is determined in itself, and not through anything else. “But if these substances were distinguished by their affections, since substance is by nature prior to its affections it would follow that if from substance its affections were abstracted and it were regarded in itself, *i.e.* in its truth, it could henceforth not be regarded as distinct from other substances.” “Eighth Proposition: All substance is necessarily infinite. Proof: For otherwise it must be limited by another substance of the same nature, in which case there would be two substances of the same attribute, which is contrary to the fifth proposition.” “Every attribute must be conceived for itself,” as determination reflected on itself. “For attribute is what the mind conceives of substance as constituting its essence, from which it follows that it must be conceived through itself,” *i.e.* substance is what is conceived through itself (see the fourth and third definitions). “Therefore we may not argue from the plurality of attributes to a plurality of substances, for each is conceived by itself, and they have all been, always and at the same time, in substance, without the possibility of the one being produced by the other.” “Substance is indivisible. For if the parts retained the nature of the substance, there would be several substances of the same nature, which is contrary to the fifth proposition. If not, infinite substance would cease to exist, which is absurd.”[195]

“Fourteenth Proposition: No other substance than God can either exist or be conceived. Proof: God is the absolutely infinite substance, to whom can be denied no attribute which expresses the essence of substance, and He exists necessarily; therefore if there were a substance other than God, it must be explained by means of an attribute of God.” Consequently the substance would not have its own being, but that of God, and therefore would not be a substance. Or if it were still to be substance, “then there would necessarily follow the possibility of there being two substances with the same attribute, which according to the fifth proposition is absurd. From this it then follows that the thing extended and the thing that thinks” are not substances, but “are either attributes of God, or affections of His attributes.” By these proofs and others like them not much is to be gained. “Fifteenth, proposition: What is, is in God, and cannot exist or be conceived without God.” “Sixteenth proposition: By the necessity of the divine nature infinite things must follow in infinite modes, *i.e.*, all that can fall under the infinite understanding. God is therefore the absolute First Cause.”[196]

Spinoza then ascribes freedom and necessity to God: “God is the absolute free cause, who is determined by nothing outside of Himself, for He exists solely by the necessity of His nature. There is no cause which inwardly or outwardly moves Him to act, except the perfection of His nature. His activity is by the laws of His Being necessary and eternal; what therefore follows from His absolute nature, from His attributes, is eternal, as it follows from the nature of the triangle from eternity and to eternity that its three angles are equal to two right angles.” That is to say, His Being is His absolute power; *actus* and *potentia*, Thought and Being, are in Him one. God has not therefore any other thoughts which He could not have actualized. “God is the immanent cause of all things, not the transient (*transiens*),” *i.e.*, external cause. “His essence and His existence are the same, namely, the truth. A thing which is determined to perform some

action, is, since God is cause, necessarily determined thereto by God; and a thing which is thus determined cannot render itself undetermined. In nature nothing is contingent. Will is not a free cause, but only a necessary cause, only a mode; it is therefore determined by another. God acts in accordance with no final causes (*sub ratione boni*). Those who assert that He does so, appear to establish something apart from God, which does not depend on God, and which God in His working keeps in view, as though it were an end. If this view is taken, God is not a free cause, but is subject to fate. It is equally inadmissible to subject all things to the arbitrary pleasure of God, *i.e.*, to His indifferent will."[197] He is determined solely by His own nature; the activity of God is thus His power, and that is necessity. He is then absolute power in contrast to wisdom, which sets up definite aims, and consequently limitations; particular aims, thoughts of what is about to come to pass, and the like are therefore put out of the question. But beyond this universal, no advance is made; for it must be noticed as specially singular, that Spinoza in the fiftieth Letter (Oper. T. I. p. 634) says that every determination is a negation. Moreover, if God is the cause of the world, it is implied that He is finite; for the world is here put beside God as something different from Him.

b. The greatest difficulty in Spinoza is, in the distinctions to which he comes, to grasp the relation of this determinate to God, at the same time preserving the determination. "God is a thinking Being, because all individual thoughts are modes which express God's nature in a certain and determinate manner; there pertains therefore to God an attribute the conception of which all individual thoughts involve, and by means of this they also are conceived. God is an extended Being for the same reason." This means that the same substance, under the attribute of thought, is the intelligible world, and under the attribute of extension, is nature; nature and thought thus both express the same Essence of God. Or, as Spinoza says,

“The order and system of natural things is the same as the order of the thoughts. Thus, for instance, the circle which exists in nature, and the idea of the existing circle, which is also in God, are one and the same thing” (they are one and the same content), “which is” merely “expressed by means of different attributes. If we therefore regard nature either under the attribute of extension or of thought, or under any other attribute whatever, we shall find one and the same connection of causes, *i.e.*, the same sequence of things. The formal Being of the idea of the circle can be conceived only by means of the mode of thought, as its proximate cause, and this mode again by means of another, and so on infinitely; so that we must explain the order of the whole of nature, or the connection of causes, by the attribute of thought alone, and if things are considered by the attribute of extension, they must be considered only by the attribute of extension, — and the same holds good of other causes.”[198] It is one and the same system, which at one time appears as nature, and at another time in the form of thought.

But Spinoza does not demonstrate how these two are evolved from the one substance, nor does he prove why there can only be two of them. Neither are extension and thought anything to him in themselves, or in truth, but only externally; for their difference is a mere matter of the understanding, which is ranked by Spinoza only among affections (Eth. P. I. Prop. XXXI. Demonst. p. 62), and as such has no truth. This has in recent times been served up again by Schelling in the following form: In themselves, the intelligent world and the corporeal world are the same, only under different forms; so that the intelligent universe is in itself the whole absolute divine totality, and the corporeal universe is equally this same totality. The differences are not in themselves, but the different aspects from which the Absolute is regarded are matters external to it. We take a higher tone in saying that nature and mind are rational; but reason is for us no

empty word, for it means the totality which develops itself within itself. Again, it is the standpoint of reflection to regard aspects only, and nothing in itself. This defect appears in Spinoza and Schelling in the fact that they see no necessity why the Notion, as the implicit negative of its unity, should make a separation of itself into different parts; so that out of the simple universal the real, the opposed, itself becomes known. Absolute substance, attribute and mode, Spinoza allows to follow one another as definitions, he adopts them ready-made, without the attributes being developed from the substance, or the modes from the attributes. And more especially in regard to the attributes, there is no necessity evident, why these are thought and extension in particular.

c. When Spinoza passes on to individual things, especially to self-consciousness, to the freedom of the 'I,' he expresses himself in such a way as rather to lead back all limitations to substance than to maintain a firm grasp of the individual. Thus we already found the attributes not to be independent, but only the forms in which the understanding grasps substance in its differences; what comes third, the modes, is that under which for Spinoza all difference of things alone falls. Of the modes he says (Ethic. P. I. Prop. XXXII. Demonst. et Coroll. II. p. 63): In every attribute there are two modes; in extension, these are rest and motion, in thought they are understanding and will (*intellectus et voluntas*). They are mere modifications which only exist for us apart from God; therefore whatever refers to this difference and is specially brought about by it, is not absolute, but finite. These affections Spinoza sums up (Ethices, P. I. Prop. XXIX. Schol. pp. 61, 62) under the head of *natura naturata*: "*Natura naturans* is God regarded as free cause, in so far as He is in Himself and is conceived by Himself: or such attributes of substance as express the eternal and infinite essence. By *natura naturata*, I understand all that follows from the necessity of the divine nature, or from any of the attributes of God, all

modes of the divine attributes, in so far as they are regarded as things which are in God, and which without God can neither exist nor be conceived." From God proceeds nothing, for all things merely return to the point whence they came, if from themselves the commencement is made.

These then are Spinoza's general forms, this is his principal idea. Some further determinations have still to be mentioned. He gives definitions of the terms modes, understanding, will, and of the affections, such as joy and sadness.[199] We further find consciousness taken into consideration. Its development is extremely simple, or rather it is not developed at all; Spinoza begins directly with mind. "The essence of man consists of certain modifications of the attributes of God"; these modifications are only something related to our understanding. "If we, therefore, say that the human mind perceives this or that, it means nothing else than that God has this or that idea, not in so far as He is infinite, but in so far as He is expressed by the idea of the human mind. And if we say that God has this or that idea, not in so far as He constitutes the idea of the human mind, but in so far as He has, along with the human mind, the idea of another thing, then we say that the human mind perceives the thing partially or inadequately." Truth is for Spinoza, on the other hand, the adequate.[200] The idea that all particular content is only a modification of God is ridiculed by Bayle,[201] who argues from it that God modified as Turks and Austrians, is waging war with Himself; but Bayle has not a trace of the speculative element in him, although he is acute enough as a dialectician, and has contributed to the intelligent discussion of definite subjects.

The relation of thought and extension in the human consciousness is dealt with by Spinoza as follows: "What has a place in the object" (or rather in the objective) "of the idea which constitutes the human mind must be perceived by the human mind; or there must necessarily be in the mind an idea of this object. The object of the idea which constitutes the human mind

is body, or a certain mode of extension. If, then, the object of the idea which constitutes the human mind, is the body, there can happen nothing in the body which is not perceived by the mind. Otherwise the ideas of the affections of the body would not be in God, in so far as He constitutes our mind, but the idea of another thing: that is to say, the ideas of the affections of our body would not be likewise in our mind." What is perplexing to understand in Spinoza's system is, on the one hand, the absolute identity of thought and Being, and, on the other hand, their absolute indifference to one another, because each of them is a manifestation of the whole essence of God. The unity of the body and consciousness is, according to Spinoza, this, that the individual is a mode of the absolute substance, which, as consciousness, is the representation of the manner in which the body is affected by external things; all that is in consciousness is also in extension, and conversely. "Mind knows itself only in so far as it perceives the ideas of the affections of body," it has only the idea of the affections of its body; this idea is synthetic combination, as we shall immediately see. "The ideas, whether of the attributes of God or of individual things, do not recognize as their efficient cause their objects themselves, or the things perceived, but God Himself, in so far as He is that which thinks."[202] Buhle (Geschichte der neuern Philos. Vol. III. Section II. p. 524) sums up these propositions of Spinoza thus: "Thought is inseparably bound up with extension; therefore all that takes place in extension must also take place in consciousness." Spinoza, however, also accepts both in their separation from one another. The idea of body, he writes (Epistol. LXVI. p. 673), includes only these two in itself, and does not express any other attributes. The body which it represents is regarded under the attribute of extension; but the idea itself is a mode of thought. Here we see a dividing asunder; mere identity, the undistinguishable nature of all things in the Absolute, is insufficient even for Spinoza.

The *individuum*, individuality itself, is thus defined by Spinoza (Ethic. P. II. Prop. XIII. Defin. p. 92): "When several bodies of the same or of different magnitudes are so pressed together that they rest on one another, or when, moving with like or different degrees of rapidity, they communicate their movement to one another in a certain measure, we say that such bodies are united to one another, and that all together they form one body or individuum, which by this union distinguishes itself from all the other bodies." Here we are at the extreme limit of Spinoza's system, and it is here that his weak point appears. Individuation, the one, is a mere synthesis; it is quite a different thing from the Ichts or self-hood of Boehme (*supra*, pp. 205-207), since Spinoza has only universality, thought, and not self-consciousness. If, before considering this in reference to the whole, we take it from the other side, namely from the understanding, the distinction really falls under that head; it is not deduced, it is found. Thus, as we have already seen (p. 270) "the understanding in act (*intellectus actu*), as also will, desire, love, must be referred to *natura naturata*, not to *natura naturans*. For by the understanding, as recognized for itself, we do not mean absolute thought, but only a certain mode of thought — a mode which is distinct from other modes like desire, love, etc., and on that account must be conceived by means of absolute thought, *i.e.* by means of an attribute of God which expresses an eternal and infinite essentiality of thought; without which the understanding, as also the rest of the modes of thought, could neither be nor be conceived to be." (Spinoza, Ethices, P. I. Propos. XXXI. pp. 62, 63). Spinoza is unacquainted with an infinity of form, which would be something quite different from that of rigid, unyielding substance. What is requisite is to recognize God as the essence of essences, as universal substance, identity, and yet to preserve distinctions.

Spinoza goes on to say: "What constitutes the real (*actuale*) existence of the human mind is nothing else than the idea of a particular" (individual)

“thing, that actually exists,” not of an infinite thing. “The essence of man involves no necessary existence, *i.e.* according to the order of nature a man may just as well be as not be.” For the human consciousness, as it does not belong to essence as an attribute, is a mode — a mode of the attribute of thought. But neither is the body, according to Spinoza, the cause of consciousness, nor is consciousness the cause of the body, but the finite cause is here only the relation of like to like; body is determined by body, conception by conception. “The body can neither determine the mind to thought, nor can the mind determine the body to motion, or rest, or anything else. For all modes of thought have God as Cause, in so far as He is a thinking thing, and not in so far as He is revealed by means of another attribute. What therefore determines the mind to thought, is a mode of thought and not of extension; similarly motion and rest of the body must be derived from another body.”[203] I might quote many other such particular propositions from Spinoza, but they are very formal, and a continual repetition of one and the same thing.

Buhle (Gesch. d. neuern Phil. Vol. III. Section 2, pp. 525-528), attributes limited conceptions to Spinoza: “The soul experiences in the body all the ‘other’ of which it becomes aware as outside of the body, and it becomes aware of this ‘other’ only by means of the conceptions of the qualities which the body perceives therein. If, therefore, the body can perceive no qualities of a thing, the soul also can come to no knowledge of it. On the other hand, the soul is equally unable to arrive at the perception of the body which belongs to it; the soul knows not that the body is there, and knows itself even in no other way than by means of the qualities which the body perceives in things which are outside of it, and by means of the conceptions of the same. For the body is an individual thing, determined in a certain manner, which can only gradually, in association with and amidst other individual things, attain to existence, and can preserve itself in existence

only as thus connected, combined and associated with others," *i.e.* in infinite progress; the body can by no means be conceived from itself. "The soul's consciousness expresses a certain determinate form of a Notion, as the Notion itself expresses a determinate form of an individual thing. But the individual thing, its Notion, and the Notion of this Notion are altogether and entirely one and the same thing, only regarded under different attributes. As the soul is nothing else than the immediate Notion of the body, and is one and the same thing with this, the excellence of the soul can never be anything else than the excellence of the body. The capacities of the understanding are nothing but the capacities of the body, if they are looked at from the corporeal point of view, and the decisions of the will are likewise determinations of the body. Individual things are derived from God in an eternal and infinite manner" (*i.e.* once and for all), "and not in a transitory, finite and evanescent manner: they are derived from one another merely inasmuch as they mutually produce and destroy each other, but in their eternal existence they endure unchangeable. All individual things mutually presuppose each other; one cannot be thought without the other; that is to say they constitute together an inseparable whole; they exist side by side in one utterly indivisible, infinite Thing, and in no other way whatever."

3. We have now to speak of Spinoza's system of morals, and that is a subject of importance. Its great principle is no other than this, that the finite spirit is moral in so far as it has the true Idea, *i.e.* in so far as it directs its knowledge and will on God, for truth is merely the knowledge of God. It may be said that there is no morality loftier than this, since its only requisite is to have a clear idea of God. The first thing Spinoza speaks of in this regard is the affections: "Everything strives after self-preservation. This striving is the actual essence of the thing, and involves only indefinite time; when referred exclusively to mind, it is termed will; when referred to both

mind and body together, it is called desire. Determination of the will (*volitio*) and Idea are one and the same thing. The sense of liberty rests on this, that men do not know the determining causes of their actions. The affection is a confused idea; the more clearly and distinctly, therefore, we know the affection, the more it is under our control."[204] The influence of the affections, as confused and limited (inadequate) ideas, upon human action, constitutes therefore, according to Spinoza, human slavery; of the passionate affections the principal are joy and sorrow; we are in suffering and slavery in so far as we relate ourselves as a part.[205]

"Our happiness and liberty consist in an enduring and eternal love to God; this intellectual love follows from the nature of mind, in so far as it is regarded as eternal truth through the nature of God. The more a man recognizes God's existence and loves Him, the less does he suffer from evil affections and the less is his fear of death."[206] Spinoza requires in addition the true kind of knowledge. There are, according to him, three kinds of knowledge; in the first, which he calls opinion and imagination, he includes the knowledge which we obtain from an individual object through the senses — a knowledge fragmentary and ill-arranged — also knowledge drawn from signs, pictorial conceptions and memory. The second kind of knowledge is for Spinoza that which we derive from general conceptions and adequate ideas of the properties of things. The third is intuitive knowledge (*scientia intuitiva*) which rises from the adequate idea of the formal essence of certain attributes of God to the adequate knowledge of the essence of things.[207] Regarding this last he then says: "The nature of reason is not to contemplate things as contingent, but as necessary ... to think of all things under a certain form of eternity (*sub quadam specie æternitatis*);" *i.e.* in absolutely adequate Notions, *i.e.* in God. "For the necessity of things is the necessity of the eternal nature of God Himself. Every idea of an individual thing necessarily includes the eternal and infinite essence of God

in itself. For individual things are modes of an attribute of God; therefore they must include in themselves His eternal essence. Our mind, in so far as it knows itself and the body under the form of eternity, has to that extent necessarily the knowledge of God, and knows that it is itself in God and is conceived through God. All Ideas, in so far as they are referable to God, are true."[208] Man must trace back all things to God, for God is the One in All; the eternal essence of God is the one thing that is, the eternal truth is the only thing for man to aim at in his actions. With Spinoza this is not a knowledge arrived at through philosophy, but only knowledge of a truth. "The mind can succeed in tracing back all affections of the body or images of things to God. In proportion as the mind regards all things as necessary, it has a greater power over its affections," which are arbitrary and contingent. This is the return of the mind to God, and this is human freedom; as mode, on the other hand, the spirit has no freedom, but is determined from without. "From the third kind of knowledge there arises the repose of the mind; the supreme good of the mind is to know God, and this is its highest virtue. This knowledge necessarily produces the intellectual love of God; for it produces a joyfulness accompanied by the Idea of God as cause — *i.e.* the intellectual love of God. God Himself loves Himself with an infinite intellectual love."[209] For God can have only Himself as aim and cause; and the end of the subjective mind is to be directed on Him. This is therefore the purest, but also a universal morality.

In the thirty-sixth Letter (pp. 581-582) Spinoza speaks of Evil. The allegation is made that God, as the originator of all things and everything, is also the originator of evil, is consequently Himself evil; in this identity all things are one, good and evil are in themselves the same thing, in God's substance this difference has disappeared. Spinoza says in answer to this: "I assert the fact that God absolutely and truly" (as cause of Himself) "is the cause of everything that has an essential content" (*i.e.* affirmative reality)

“be it what it may. Now if you can prove to me that evil, error, crime, etc., are something that expresses an essence, I will freely admit to you that God is the originator of crime and evil and error. But I have elsewhere abundantly demonstrated that the form of evil cannot subsist in anything that expresses an essence, and therefore it cannot be said that God is the cause of evil.” Evil is merely negation, privation, limitation, finality, mode — nothing in itself truly real. “Nero’s murder of his mother, in so far as it had positive content, was no crime. For Orestes did the same external deed, and had in doing it the same end in view — to kill his mother; and yet he is not blamed,” and so on. The affirmative is the will, the intention, the act of Nero. “Wherein then consists Nero’s criminality? In nothing else but that he proved himself ungrateful, merciless, and disobedient. But it is certain that all this expresses no essence, and therefore God was not the cause of it, though He was the cause of Nero’s action and intention.” These last are something positive, but yet they do not constitute the crime as such; it is only the negative element, such as mercilessness, etc. that makes the action a crime. “We know that whatever exists, regarded in itself and without taking anything else into consideration, contains a perfection which extends as widely as the essence of the thing itself extends, for the essence is in no way different therefrom.”— “Because then,” we find in the thirty-second letter (pp. 541, 543), “God does not regard things abstractly, or form general definitions,” (of what the thing ought to be) “and no more reality is required of things than the Divine understanding and power has given and actually meted out to them; therefore it clearly follows that such privation exists only and solely in respect to our understanding, but not in respect to God;” for God is absolutely real. It is all very well to say this, but it does not meet the case. For in this way God and the respect to our understanding are different. Where is their unity? How is this to be conceived? Spinoza continues in the thirty-sixth letter: “Although the works of the righteous

(*i.e.* of those who have a clear idea of God, to which they direct all their actions and even their thoughts), and" also the works "of the wicked (*i.e.* of those who have no idea of God, but only ideas of earthly things," — individual, personal interests and opinions,— "by which their actions and thoughts are directed), and all whatsoever exists, necessarily proceed from God's eternal laws and counsels, and perpetually depend on God, they are yet not distinguished from one another in degree, but in essence; for although a mouse as well as an angel depends on God, and sorrow as well as joy, yet a mouse cannot be a kind of angel, and sorrow cannot be a kind of joy," — they are different in essence.

There is therefore no ground for the objection that Spinoza's philosophy gives the death-blow to morality; we even gain from it the great result that all that is sensuous is mere limitation, and that there is only one true substance, and that human liberty consists in keeping in view this one substance, and in regulating all our conduct in accordance with the mind and will of the Eternal One. But in this philosophy it may with justice be objected that God is conceived only as Substance, and not as Spirit, as concrete. The independence of the human soul is therein also denied, while in the Christian religion every individual appears as determined to salvation. Here, on the contrary, the individual spirit is only a mode, an accident, but not anything substantial. This brings us to a general criticism of the philosophy of Spinoza, in the course of which we shall consider it from three different points of view.

In the first place Spinozism is asserted to be Atheism — by Jacobi, for instance (Werke, Vol. IV. Section I. p. 216) — because in it no distinction is drawn between God and the world; it makes nature the real God, or lowers God to the level of nature, so that God disappears and only nature is established. But it is not so much God and nature that Spinoza sets up in mutual opposition, as thought and extension; and God is unity, not One

made up of two, but absolute Substance, in which has really disappeared the limitation of the subjectivity of thought and nature. Those who speak against Spinoza do so as if it were on God's account that they were interested; but what these opponents are really concerned about is not God, but the finite — themselves. The relationship between God and the finite, to which we belong, may be represented in three different ways: firstly, only the finite exists, and in this way we alone exist, but God does not exist — this is atheism; the finite is here taken absolutely, and is accordingly the substantial. Or, in the second place, God alone exists; the finite has no reality, it is only phenomena, appearance. To say, in the third place, that God exists and we also exist is a false synthetic union, an amicable compromise. It is the popular view of the matter that the one side has as much substantiality as the other; God is honoured and supreme, but finite things also have Being to exactly the same extent. Reason cannot remain satisfied with this "also," with indifference like this. The philosophic requisite is therefore to apprehend the unity of these differences in such a way that difference is not let slip, but proceeds eternally from substance, without being petrified into dualism. Spinoza is raised above this dualism; religion is so also, if we turn its popular conceptions into thoughts. The atheism of the first attitude — when men set up as ultimate the arbitrariness of the will, their own vanity, the finite things of nature, and the world dwells for ever in the mind — is not the standpoint of Spinoza, for whom God is the one and only substance, the world on the contrary being merely an affection or mode of this substance. In the respect that Spinoza does not distinguish God from the world, the finite, it is therefore correct to term his theory atheism, for his words are these: Nature, the human mind, the individual, are God revealed under particular forms. It has been already remarked (pp. 257, 258, 280) that undoubtedly Substance with Spinoza does not perfectly fulfil the conception of God, since it is as Spirit that He is

to be conceived. But if Spinoza is called an atheist for the sole reason that he does not distinguish God from the world, it is a misuse of the term. Spinozism might really just as well or even better have been termed Acosmism, since according to its teaching it is not to the world, finite existence, the universe, that reality and permanency are to be ascribed, but rather to God alone as the substantial. Spinoza maintains that there is no such thing as what is known as the world; it is merely a form of God, and in and for itself it is nothing. The world has no true reality, and all this that we know as the world has been cast into the abyss of the one identity. There is therefore no such thing as finite reality, it has no truth whatever; according to Spinoza what is, is God, and God alone. Therefore the allegations of those who accuse Spinoza of atheism are the direct opposite of the truth; with him there is too much God. They say: If God is the identity of mind and nature, then nature or the individual man is God. This is quite correct, but they forget that nature and the individual disappear in this same identity: and they cannot forgive Spinoza for thus annihilating them. Those who defame him in such a way as this are therefore not aiming at maintaining God, but at maintaining the finite and the worldly; they do not fancy their own extinction and that of the world. Spinoza's system is absolute pantheism and monotheism elevated into thought. Spinozism is therefore very far removed from being atheism in the ordinary sense; but in the sense that God is not conceived as spirit, it is atheism. However, in the same way many theologians are also atheists who speak of God only as the Almighty Supreme Being, etc., who refuse to acknowledge God, and who admit the validity and truth of the finite. They are many degrees worse than Spinoza.

The second point to be considered is the method adopted by Spinoza for setting forth his philosophy; it is the demonstrative method of geometry as employed by Euclid, in which we find definitions, explanations, axioms, and theorems. Even Descartes made it his starting-point that philosophic

propositions must be mathematically handled and proved, that they must have the very same evidence as mathematics. The mathematical method is considered superior to all others, on account of the nature of its evidence; and it is natural that independent knowledge in its re-awakening lighted first upon this form, of which it saw so brilliant an example. The mathematical method is, however, ill-adapted for speculative content, and finds its proper place only in the finite sciences of the understanding. In modern times Jacobi has asserted (Werke, Vol. IV. Section I. pp. 217-223) that all demonstration, all scientific knowledge leads back to Spinozism, which alone is a logical method of thought; and because it must lead thither, it is really of no service whatever, but immediate knowledge is what we must depend on. It may be conceded to Jacobi that the method of demonstration leads to Spinozism, if we understand thereby merely the method of knowledge belonging to the understanding. But the fact is that Spinoza is made a testing-point in modern philosophy, so that it may really be said: You are either a Spinozist or not a philosopher at all. This being so, the mathematical and demonstrative method of Spinoza would seem to be only a defect in the external form; but it is the fundamental defect of the whole position. In this method the nature of philosophic knowledge and the object thereof, are entirely misconceived, for mathematical knowledge and method are merely formal in character and consequently altogether unsuited for philosophy. Mathematical knowledge exhibits its proof on the existent object as such, not on the object as conceived; the Notion is lacking throughout; the content of Philosophy, however, is simply the Notion and that which is comprehended by the Notion. Therefore this Notion as the knowledge of the essence is simply one assumed, which falls within the philosophic subject; and this is what represents itself to be the method peculiar to Spinoza's philosophy. Of this demonstrative manner we have already seen these examples: (α) The definitions from which Spinoza takes

his start — as in geometry a commencement is made with the line, triangle, &c. — concern universal determinations, such as cause of itself, the finite, substance, attribute, mode, and so on, which are solely and simply accepted and assumed, not deduced, nor proved to be necessary: for Spinoza is not aware of how he arrives at these individual determinations. (β) He further speaks of axioms, for instance (Ethic. P. I. Ax. I. p. 36): "What is, is either in itself or in another." The determinations "in itself" and "in another" are not shown forth in their necessity: neither is this disjunction proved, it is merely assumed. (γ) The propositions have, as such, a subject and predicate which are not similar. When the predicate is proved of the subject and necessarily combined with it, the discrepancy remains that the one as universal is related to the other as particular: therefore even although the relation is proved, there is present at the same time a secondary relation. Mathematical science, in its true propositions respecting a whole, escapes from the difficulty by proving also the converse of the propositions, in this way obtaining for them a special definiteness by proving each proposition in both ways. True propositions may, therefore, be looked on as definitions, and the conversion is the proof of the proposition in the form in which it is expressed. But this means of escaping the difficulty Philosophy cannot well employ, since the subject of which something is proved is itself only the Notion or the universal, and the proposition form is therefore quite superfluous and out of place. What has the form of the subject is in the form of an existent thing, as contrasted with the universal, the content of the proposition. The existent thing is taken as signifying existent in the ordinary sense; it is the word which we use in every-day life, and of which we have a conception that has nothing of the Notion in it. The converse of a proposition would simply read like this: The Notion is that which is thus popularly conceived. This proof from the usage of language — that we also understand this to be the meaning in every-day life, or in other words that

the name is correct — has no philosophic significance. But if the proposition is not one like this, but an ordinary proposition, and if the predicate is not the Notion, but some general term or other, a predicate of the subject, such propositions are really not philosophic: we might instance the statement that substance is one and not several, but only that in which substance and unity are the same. Or, in other words, this unity of the two moments is the very thing which the proof has to demonstrate, it is the Notion or the essence. In this case it looks as if the proposition were the matter of chief importance, the truth. But if in these really only so-called propositions, subject and predicate are in truth not alike, because one is individual and the other universal, their relation is essential, *i.e.* the reason for which they are one. The proof has here a false position indeed, as if that subject were implicit or in itself, whereas subject and predicate are, fundamentally even, moments in separation; in the judgment "God is One," the subject itself is universal, since it resolves itself into unity. On the other side it is implied in this false position that the proof is brought in from outside merely, as in mathematics from a preceding proposition, and that the proposition is not therefore conceived through itself; thus we see the ordinary method of proof take its middle term, the principle, from anywhere it can, in the same way as in classification it takes its principle of classification. The proposition is then, as it were, a secondary affair; but we must ask if this proposition is true. The result as proposition ought to be truth, but is only knowledge. The movement of knowledge, as proof, falls therefore, in the third place, outside of the proposition, which ought to be the truth. The essential moments of the system are really already completely contained in the presuppositions of the definitions, from which all further proofs have merely to be deduced. But whence have we these categories which here appear as definitions? We find them doubtless in ourselves, in scientific culture. The existence of the understanding, the will, extension, is

therefore not developed from infinite substance, but it is directly expressed in these determinations, and that quite naturally; for of a truth there exists the One into which everything enters, in order to be absorbed therein, but out of which nothing comes. For as Spinoza has set up the great proposition, all determination implies negation (*supra*, p. 267), and as of everything, even of thought in contrast to extension, it may be shown that it is determined and finite, what is essential in it rests upon negation. Therefore God alone is the positive, the affirmative, and consequently the one substance; all other things, on the contrary, are only modifications of this substance, and are nothing in and for themselves. Simple determination or negation belongs only to form, but is quite another thing from absolute determinateness or negativity, which is absolute form; in this way of looking at it negation is the negation of negation, and therefore true affirmation. This negative self-conscious moment, the movement of knowledge, which pursues its way in the thought which is present before us, is however certainly lacking to the content of Spinoza's philosophy, or at least it is only externally associated with it, since it falls within self-consciousness. That is to say, thoughts form the content, but they are not self-conscious thoughts or Notions: the content signifies thought, as pure abstract self-consciousness, but an unreasoning knowledge, into which the individual does not enter: the content has not the signification of 'I.' Therefore the case is as in mathematics; a proof is certainly given, conviction must follow, but yet the matter fails to be understood. There is a rigid necessity in the proof, to which the moment of self-consciousness is lacking; the 'I' disappears, gives itself altogether up, merely withers away. Spinoza's procedure is therefore quite correct; yet the individual proposition is false, seeing that it expresses only one side of the negation. The understanding has determinations which do not contradict one another; contradiction the understanding cannot suffer. The negation of negation is,

however, contradiction, for in that it negates negation as simple determination, it is on the one hand affirmation, but on the other hand also really negation; and this contradiction, which is a matter pertaining to reason, is lacking in the case of Spinoza. There is lacking the infinite form, spirituality and liberty. I have already mentioned before this (pp. 93, 94; 129-137) that Lullus and Bruno attempted to draw up a system of form, which should embrace and comprehend the one substance which organizes itself into the universe; this attempt Spinoza did not make.

Because negation was thus conceived by Spinoza in one-sided fashion merely, there is, in the third place, in his system, an utter blotting out of the principle of subjectivity, individuality, personality, the moment of self-consciousness in Being. Thought has only the signification of the universal, not of self-consciousness. It is this lack which has, on the one side, brought the conception of the liberty of the subject into such vehement antagonism to the system of Spinoza, because it set aside the independence of the human consciousness, the so-called liberty which is merely the empty abstraction of independence, and in so doing set aside God, as distinguished from nature and the human consciousness — that is as implicit or in Himself, in the Absolute; for man has the consciousness of freedom, of the spiritual, which is the negative of the corporeal, and man has also the consciousness that his true Being lies in what is opposed to the corporeal. This has been firmly maintained by religion, theology, and the sound common sense of the common consciousness, and this form of opposition to Spinoza appears first of all in the assertion that freedom is real, and that evil exists. But because for Spinoza, on the other hand, there exists only absolute universal substance as the non-particularized, the truly real — all that is particular and individual, my subjectivity and spirituality, has, on the other hand, as a limited modification whose Notion depends on another, no absolute existence. Thus the soul, the Spirit, in so far as it is an individual

Being, is for Spinoza a mere negation, like everything in general that is determined. As all differences and determinations of things and of consciousness simply go back into the One substance, one may say that in the system of Spinoza all things are merely cast down into this abyss of annihilation. But from this abyss nothing comes out; and the particular of which Spinoza speaks is only assumed and presupposed from the ordinary conception, without being justified. Were it to be justified, Spinoza would have to deduce it from his Substance; but that does not open itself out, and therefore comes to no vitality, spirituality or activity. His philosophy has only a rigid and unyielding substance, and not yet spirit; in it we are not at home with ourselves. But the reason that God is not spirit is that He is not the Three in One. Substance remains rigid and petrified, without Boehme's sources or springs; for the individual determinations in the form of determinations of the understanding are not Boehme's originating spirits, which energize and expand in one another (*supra*, pp. 202, 203). What we find regarding this particular then is that it is only a modification of absolute substance, which, however, is not declared to be such; for the moment of negativity is what is lacking to this rigid motionlessness, whose single form of activity is this, to divest all things of their determination and particularity and cast them back into the one absolute substance, wherein they are simply swallowed up, and all life in itself is utterly destroyed. This is what we find philosophically inadequate with Spinoza; distinctions are externally present, it is true, but they remain external, since even the negative is not known in itself. Thought is the absolutely abstract, and for that very reason the absolutely negative; it is so in truth, but with Spinoza it is not asserted to be the absolutely negative. But if in opposition to Spinozism we hold fast to the assertion that Spirit, as distinguishing itself from the corporeal, is substantial, actual, true, and in the same way that freedom is not something merely privative, then this actuality in formal

thought is doubtless correct, yet it rests only upon feeling; but the further step is that the Idea essentially includes within itself motion and vitality, and that it consequently has in itself the principle of spiritual freedom. On the one hand, therefore, the defect of Spinozism is conceived as consisting in its want of correspondence with actuality; but on the other side it is to be apprehended in a higher sense, I mean in the sense that substance with Spinoza is only the Idea taken altogether abstractly, not in its vitality.

If, in conclusion, we sum up this criticism that we have offered, we would say that on the one hand with Spinoza negation or privation is distinct from substance; for he merely assumes individual determinations, and does not deduce them from substance. On the other hand the negation is present only as Nothing, for in the absolute there is no mode; the negative is not there, but only its dissolution, its return: we do not find its movement, its Becoming and Being. The negative is conceived altogether as a vanishing moment — not in itself, but only as individual self-consciousness; it is not like the *Separator* we met with in Boehme's system (*supra*, p. 206). Self-consciousness is born from this ocean, dripping with the water thereof, *i.e.* never coming to absolute self-hood; the heart, the independence is transfixed — the vital fire is wanting. This lack has to be supplied, the moment of self-consciousness has to be added. It has the following two special aspects, which we now perceive emerging and gaining acceptance; in the first place the objective aspect, that absolute essence obtains in self-consciousness the mode of an object of consciousness for which the "other" exists, or the existent as such, and that what Spinoza understood by the "modes" is elevated to objective reality as an absolute moment of the absolute; in the second place we have the aspect of self-consciousness, individuality, independence. As was formerly the case with respect to Bacon and Boehme, the former aspect is here taken up by the Englishman, John Locke, the latter by the German Leibnitz; in the

first case it did not appear as a moment, nor did it in the second appear as absolute Notion. Now while Spinoza only takes notice of these ordinary conceptions, and the highest point of view he reaches in regard to them is that they sink and disappear in the one Substance, Locke on the contrary examines the genesis of these conceptions, while Leibnitz opposes to Spinoza the infinite multiplicity of individuals, although all these monads have one monad as the basis of their Being. Both Locke and Leibnitz therefore came forward as opponents of the above-mentioned one-sidedness of Spinoza.

3. Malebranche.

The philosophy of Malebranche is in point of matter entirely identical with that of Spinoza, but it has another, a more religious and more theological form; on account of this form it never encountered the opposition met with by Spinoza, and for the same reason Malebranche has never been reproached with Atheism.

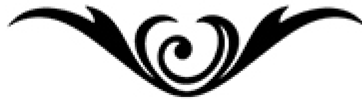
Nicholas Malebranche was born at Paris in 1638. He was sickly and deformed in body, and was hence brought up with great care. He was diffident and loved solitude; in his twenty-second year he entered the *congrégation de l'oratoire*, a sort of spiritual order, and devoted himself to the sciences. In passing a bookseller's shop he happened accidentally to see Descartes' work *De homine*; he read it, and it interested him greatly — so much so that the reading of it brought on severe palpitation and he was forced to cease. This decided his future life; there awoke in him an irrepressible inclination for Philosophy. He was a man of most noble and gentle character, and of the most genuine and unswerving piety. He died at Paris in 1715, and in the seventy-seventh year of his age.[210] His principal work bears the title: *De la recherche de la vérité*. One part of it is entirely metaphysical, but the greater part is altogether empirical. For instance,

Malebranche in the first three books treats logically and psychologically of the errors in sight and hearing, in the imagination and understanding.

a. What is most important in this book is his idea of the origin of our knowledge. He says: "The essence of the soul is in thought, just as that of matter is in extension. All else, such as sensation, imagination and will, are modifications of thought". He thus begins with two sides, between which he sets an absolute chasm, and then he follows out in detail the Cartesian idea of the assistance of God in knowledge. His main point is that "the soul cannot attain to its conceptions and notions from external things." For when I and the thing are clearly independent of one another and have nothing in common, the two can certainly not enter into relation with one another nor be for one another. "Bodies are impenetrable; their images would destroy one another on the way to the organs." But further: "The soul cannot beget ideas from itself, nor can they be inborn," for as "Augustine has said, 'Say not that ye yourselves are your own light.'" But how then comes extension, the manifold, into the simple, into the spirit, since it is the reverse of the simple, namely the diverse? This question regarding the association of thought and extension is always an important one in Philosophy. According to Malebranche the answer is, "That we see all things in God." God Himself is the connection between us and them, and thus the unity between the thing and thought. "God has in Him the ideas of all things because He has created all; God is through His omnipresence united in the most intimate way with spirits. God thus is the place of spirits," the Universal of spirit, "just as space" is the universal, "the place of bodies. Consequently the soul knows in God what is in Him," bodies, "inasmuch as He sets forth" (inwardly conceives) "created existence, because all this is spiritual, intellectual, and present to the soul."[211] Because things and God are intellectual and we too are intellectual, we perceive them in God as they are, so to speak, intellectual in Him. If this be further analyzed it in no way differs from

Spinozism. Malebranche indeed in a popular way allows soul and things to subsist as independent, but this independence vanishes away like smoke when the principle is firmly grasped. The catechism says: “God is omnipresent,” and if this omnipresence be developed Spinozism is arrived at; and yet theologians then proceed to speak against the system of identity, and cry out about Pantheism.

b. We must further remark that Malebranche also makes the universal, thought, the essential, by placing it before the particular. “The soul has the Notion of the infinite and universal: it knows nothing excepting through the Idea which it has of the infinite; this Idea must hence come first. The universal is not a mere confusion of individual ideas, it is not a union of individual things.” According to Locke the individual from which the universal is formed precedes (*infra*, p. 299); according to Malebranche the universal Idea is what comes first in man. “If we wish to think of anything particular we think first of the universal;” it is the principle of the particular, as space is of things. All essentiality precedes our particular conceptions, and this essentiality comes first. “All essential existences (*essences*) come before our ordinary conception; they cannot be such excepting by God’s presence in the mind and spirit. He it is who contains all things in the simplicity of His nature. It seems evident that mind would not be capable of representing to itself the universal Notions of species, kind, and suchlike, if it did not see all things comprehended in one.” The universal is thus in and for itself, and it does not take its rise through the particular. “Since each existent thing is an individual, we cannot say that we see something actually created when, for example, we see a triangle in general,” for we see it through God. “No account can be given of how spirit knows abstract and common truths, excepting through the presence of Him who can enlighten spirit in an infinite way,” because He is in and for Himself the universal. “We have a clear idea of God,” of the universal: “We can have such only



through union with Him, for this idea is not a created one," but is in and for itself. As with Spinoza, the one universal is God, and in so far as it is determined, it is the particular; we see this particular only in the universal, as we see bodies in space. "We already have a conception of infinite Being, inasmuch as we have a conception of Being without regard to whether it is finite or infinite. To know a finite we must limit the infinite; and this last must thus precede. Thus spirit perceives all in the infinite; this is so far from being a confused conception of many particular things that all particular conceptions are merely participations in the universal Idea of infinitude — in the same way that God does not receive this Being from" finite "creatures, but," on the contrary, "all creatures only subsist through Him."[212]

c. As regards the turning of the soul to God, Malebranche says what Spinoza said from his ethical point of view: "It is impossible that God should have an end other than Himself (the Holy Scriptures place this beyond doubt);" the will of God can only have the good, what is without doubt universal as its end. "Hence not only is it essential that our natural love, *i.e.* the emotion which He brings forth in our spirit, should strive after Him"— "the will is really love towards God"— "but it is likewise impossible that the knowledge and the light which He gives to our spirit should make anything else known than what is in Him," for thought only exists in unity with God. "If God were to make a spirit and give it the sun as an idea or as the immediate object of its knowledge, God would have made this spirit and the idea of this spirit for the sun and not for Himself." All natural love, and still more knowledge, and the desire after truth, have God as their end. "All motions of the will as regards the creatures are only determinations of motion as regards the creator." Malebranche quotes from Augustine "that we see God even from the time we first enter upon this life (*dès cette vie*), through the knowledge that we have of eternal truths. The truth is uncreated, unchangeable, immeasurable, eternal above all things; it

is true through itself, and has its perfection from no thing. It makes the creator more perfect, and all spirits naturally seek to know it: now there is nothing that has these perfections but God, and thus the truth is God. We perceive these unchangeable and eternal truths, hence we see God." "God indeed sees but He does not feel sensuous things. If we see something sensuous, sensation and pure thought are to be found in our consciousness. Sensation is a modification of our spirit; God occasions this because He knows that our soul is capable of it. The Idea which is bound up with the sensation is in God; we see it, etc. This relation, this union of our mind and spirit with the Word (*Verbe*) of God, and of our will with His love, is that we are formed after the image of God and in His likeness."[213] Thus the love of God consists in relating one's affections to the Idea of God; whoever knows himself and thinks his affections clearly, loves God. We further find sundry empty litanies concerning God, a catechism for children of eight years of age respecting goodness, justice, omnipresence, the moral order of the world; in all their lifetime theologians do not get any further.

We have given the principal of Malebranche's ideas; the remainder of his philosophy is composed partly of formal logic, and partly of empirical psychology. He passes to the treatment of errors, how they arise, how the senses, the imagination, the understanding, deceive us, and how we must conduct ourselves in order to effect a remedy. Then Malebranche goes on (T. III. L. VI. P. I. chap. i. pp. 1-3) to the rules and laws for recognizing the truth. Thus here the term Philosophy was even applied to the manner in which reflections on particular objects are drawn from formal logic and external facts.

B. Second Division.

IT WAS LOCKE who became the instrument of setting forth this entire manner of thinking in a systematic way, for he worked out Bacon's position more fully. And if Bacon made sensuous Being to be the truth, Locke demonstrated the universal, Thought, to be present in sensuous Being, or showed that we obtained the universal, the true, from experience. From Locke a wide culture proceeds, influencing English philosophers more especially; the forms adopted by this school were various, but the principle was the same; it became a general method of regarding things in a popular way, and calls itself Philosophy, although the object of Philosophy is not to be met with here.

1. Locke.

When experience means that the Notion has objective actuality for consciousness, it is indeed a necessary element in the totality; but as this reflection appears in Locke, signifying as it does that we obtain truth by abstraction from experience and sensuous perception, it is utterly false, since, instead of being a moment, it is made the essence of the truth. It is no doubt true that against the hypothesis of the inward immediacy of the Idea, and against the method of setting it forth in definitions and axioms, as also against absolute substance, the demand that ideas should be represented as results, and the claims of individuality and self-consciousness, assert their rights to recognition. In the philosophy of Locke and Leibnitz, however, these necessities make themselves known in an imperfect manner only; the one fact which is common to both philosophers is that they, in opposition to

Spinoza and Malebranche, take for their principle the particular, finite determinateness and the individual. According to Spinoza and Malebranche substance or the universal is the true, the sole existent, the eternal, that which is in and for itself, without origin, and of which particular things are only modifications which are conceived through substance. But hereby Spinoza has done an injury to this negative; he hence arrived at no immanent determination, for all that is determined and individual is merely annihilated in his system. Now, on the contrary, the general inclination of consciousness is to maintain the difference, partly in order to mark itself out as implicitly free in opposition to its object — Being, nature, and God, and partly in order to recognize the unity in this opposition, and from the opposition itself to make the unity emerge. But those who were the instruments of this tendency comprehended themselves but little, they had still no clear consciousness of their task, nor of the manner in which their claims could be satisfied. With Locke, this principle makes its first entrance into Philosophy in a manner so completely at variance with the inflexible undifferentiated identity of the substance of Spinoza, that the sensuous and limited, the immediate present and existent, is the main and fundamental matter. Locke does not get beyond the ordinary point of view of consciousness, viz. that objects outside of us are the real and the true. The finite is thus not grasped by Locke as absolute negativity, *i.e.* in its infinitude; this we shall not find until we come to deal in the third place with Leibnitz. It is in a higher sense that Leibnitz asserts individuality, the differentiated, to be self-existent and indeed objectless, to be true Being. That is to say, it is not according to him finite, but is yet distinguished; thus, each monad is itself the totality. Leibnitz and Locke hence likewise stand in a position of mutual independence and antagonism.

John Locke was born in 1632, at Wrington, in England. He studied for himself the Cartesian philosophy at Oxford, setting aside the scholastic

philosophy which was still in vogue. He devoted himself to the study of medicine, which, however, on account of his delicate health, he never really practised. In 1664 he went with an English ambassador for a year to Berlin. After his return to England, he became acquainted with the intellectual Earl of Shaftesbury of that time, who availed himself of his medical advice, and in whose house he lived without requiring to give himself up to practice. When Lord Shaftesbury became Lord Chancellor of England, Locke received an office from him, which, however, he soon lost by a change of ministry. Owing to his dread of falling a prey to consumption, he betook himself in 1675 to Montpellier for the benefit of his health. When his patron came into power again he once more recovered the place he had lost, only to be again deposed on a fresh overthrow of this minister, and he was now compelled to flee from England. "The act by means of which Locke was driven from Oxford" (what post he held there we are not told) "was not an enactment of the University, but of James II., by whose express command, and by the peremptory authority of a written warrant, the expulsion was carried out. From the correspondence that took place, it is evident that the college submitted itself against its will to a measure which it could not resist without compromising the peace and quiet of its members." Locke went to Holland, which was at that time the land wherein all who were obliged to effect their escape from any oppression, whether political or religious, found protection, and in which the most famous and liberal-minded men were to be met with. The Court party persecuted him even here, and by royal warrant he was ordered to be taken prisoner and sent to England; consequently he had to remain hidden with his friends. When William of Orange ascended the English throne, after the Revolution of 1688, Locke returned with him to England. He was there made Commissioner of Trade and Plantations, gave to the world his famous treatise on the Human Understanding, and finally, having withdrawn from

public office on account of the delicacy of his health, he spent his remaining years in the country houses of English nobles; he died on the 28th day of October, 1704, in the seventy-third year of his life.[214]

The philosophy of Locke is much esteemed; it is still, for the most part, the philosophy of the English and the French, and likewise in a certain sense of the Germans. To put it in a few words, it asserts on the one hand that truth and knowledge rest upon experience and observation; and on the other the analysis of and abstraction from general determinations is prescribed as the method of knowledge; it is, so to speak, a metaphysical empiricism, and this is the ordinary method adopted in the sciences. In respect of method, Locke thus employs an exactly opposite system to that of Spinoza. In the methods of Spinoza and Descartes an account of the origin of ideas may be dispensed with; they are accepted at once as definitions, such as those of substance, the infinite, mode, extension, etc., all of which constitute a quite incoherent list. But we require to show where these thoughts come in, on what they are founded, and how they are verified. Thus Locke has striven to satisfy a true necessity. For he has the merit of having deserted the system of mere definitions, which were before this made the starting point, and of having attempted to make deduction of general conceptions, inasmuch as he was, for example, at the pains to show how substantiality arises subjectively from objects. That is a further step than any reached by Spinoza, who begins at once with definitions and axioms which are unverified. Now they are derived, and no longer oracularly laid down, even if the method and manner whereby this authentication is established is not the right one. That is to say, here the matter in question is merely subjective, and somewhat psychological, since Locke merely describes the methods of mind as it appears to us to be. For in his philosophy we have more especially to deal with the derivation of the general conceptions, or ideas, as he called them, that are present in our

knowledge, and with their origin as they proceed from what is outwardly and inwardly perceptible. Malebranche no doubt likewise asks how we arrive at conceptions, and thus he apparently has before him the same subject of investigation as has Locke. But firstly, this psychological element in Malebranche is merely the later development, and then to him the universal or God is plainly first, while Locke commences at once with individual perceptions, and only from them does he proceed to Notions, to God. The universal to Locke is, therefore, merely a later result, the work of our minds; it is simply something pertaining to thought, as subjective. Every man undoubtedly knows that when his consciousness develops empirically, he commences from feelings, from quite concrete conditions, and that it is only later on that general conceptions come in, which are connected with the concrete of sensation by being contained therein. Space, for example, comes to consciousness later than the spacial, the species later than the individual; and it is only through the activity of my consciousness that the universal is separated from the particular of conception, feeling, etc. Feeling undoubtedly comes lowest, it is the animal mode of spirit; but in its capacity as thinking, spirit endeavours to transform feeling into its own form. Thus the course adopted by Locke is quite a correct one, but all dialectic considerations are utterly and entirely set aside, since the universal is merely analyzed from the empirical concrete. And in this matter Kant reproaches Locke with reason, the individual is not the source of universal conceptions, but the understanding.

As to Locke's further reflections, they are very simple. Locke considers how the understanding is only consciousness, and in being so is something in consciousness, and he only recognizes the implicit in as far as it is in the same.

a. Locke's philosophy is more especially directed against Descartes, who, like Plato, had spoken of innate ideas. Locke likewise makes special

examination of the “inborn impressions (*notiones communes in foro interiori descriptæ*)” which Lord Herbert assumes in his work *De veritate*. In the first book of his work Locke combats the so-called innate ideas, theoretic as well as practical, *i.e.* the universal, absolutely existent ideas which at the same time are represented as pertaining to mind in a natural way. Locke said that we arrive first at *that* which we call idea. By this he understands not the essential determinations of man, but conceptions which we have and which are present and exist in consciousness as such: in the same way we all have arms and legs as parts of our bodies, and the desire to eat exists in everyone. In Locke we thus have the conception of the soul as of a contentless *tabula rasa* which is by-and-by filled with what we call experience.[215] The expression “innate principles” was at that time common, and these innate principles have sometimes been foolishly spoken of. But their true signification is that they are implicit, that they are essential moments in the nature of thought, qualities of a germ, which do not yet exist: only in relation to this last there is an element of truth in Locke’s conclusions. As diverse conceptions essentially determined they are only legitimatized by its being shown that they are implied in the essential nature of thought; but as propositions which hold good as axioms, and conceptions which are immediately accepted as laid down in definitions, they undoubtedly possess the form of that which is present and inborn. As they are regarded they are bound to have value in and for themselves; but this is a mere assertion. From the other point of view the question of whence they come is a futile one. Mind is undoubtedly determined in itself, for it is the explicitly existent Notion; its development signifies the coming to consciousness. But the determinations which it brings forth from itself cannot be called innate, for this development must be occasioned by an external, and only on that does the activity of mind react, in order that it may for the first time become conscious of its reality.

The grounds on which Locke refutes innate ideas are empirical. “There is nothing more commonly taken for granted than that there are certain principles, both speculative and practical, universally agreed upon by all mankind: which therefore, they argue, must needs be constant impressions which the souls of men receive in their first Beings.” But this universal consent is not to be found. We may instance the proposition, “Whatsoever is, is; and It is impossible for the same thing to be and not to be; which of all others I think have the most allowed title to innate.” But this proposition does not hold good for the Notion; there is nothing either in heaven or earth which does not contain Being and non-Being. Many men, “All children and idiots,” says Locke, “have not the least apprehension of these propositions.” “No proposition can be said to be in the mind which it never yet knew, which it was never yet conscious of.... ’Tis usually answered, That all men know and assent to them” (the propositions) “when they come to the use of reason.... If it be meant that the use of reason assists us in the knowledge of these maxims, it would prove them not to be innate.” Reason is said to be the deriving from principles already known unknown truths. How then should the application of reason be required to discover supposed innate principles? This is a weak objection, for it assumes that by innate ideas we understand those which man possesses in consciousness as immediately present. But development in consciousness is something altogether different from any inherent determination of reason, and therefore the expression innate idea is undoubtedly quite wrong. Innate principles must be found “clearest and most perspicuous nearest the fountain, in children and illiterate people, who have received least impression from foreign opinion.” Locke gives further reasons of a similar nature, more especially employing those which are of a practical kind — the diversity in moral judgments, the case of those who are utterly wicked and depraved, devoid of sense of right or conscience.[216]

b. In the second book Locke goes on to the next stage, to the origin of ideas, and seeks to demonstrate this process from experience — this is the main object of his efforts. The reason that the positive point of view which he opposes to any derivation from within, is so false, is that he derives his conceptions only from outside and thus maintains Being-for-another, while he quite neglects the implicit. He says: "Every man being conscious to himself, that he thinks; and that which his mind is applied about, while thinking, being the ideas that are there; 'tis past doubt, that men have in their minds several ideas, such as those expressed in the words, whiteness, hardness, sweetness, thinking, motion, man, elephant, army, drunkenness, and others." Idea here signifies both the ordinary conception and thought; we understand something quite different by the word idea. "It is in the first place then to be inquired, how he comes by them" (these ideas)? Innate ideas have already been refuted. "Let us then suppose the mind to be, as we say, white paper, void of all characters, without any ideas; how comes it to be furnished?... To this I answer in a word, from Experience: in that all our knowledge is founded."[217]

As to the question in point we must in the first place say that it is true that man commences with experience if he desires to arrive at thought. Everything is experienced, not merely what is sensuous, but also what excites and stimulates my mind. Consciousness thus undoubtedly obtains all conceptions and Notions from experience and in experience; the only question is what we understand by experience. In a usual way when this is spoken of the idea of nothing particular is conveyed; we speak of it as of something quite well known. But experience is nothing more than the form of objectivity; to say that it is something which is in consciousness means that it has objective form for consciousness or that consciousness experiences it, it sees it as an objective. Experience thus signifies immediate knowledge, perception, *i.e.* I myself must have and be something, and the

consciousness of what I have and am is experience. Now there is no question as to this, that whatever we know, of whatever kind it may be, must be experienced, that rests in the conception of the thing. It is absurd to say that one knows anything which is not in experience. I undoubtedly know men, for instance, from experience, without requiring to have seen them all, for I have, as man, activity and will, a consciousness respecting what I am and what others are. The rational exists, *i.e.* it is as an existent for consciousness, or this last experiences it; it must be seen and heard, it must be there or have been there as a phenomenon in the world. This connection of universal with objective is however in the second place not the only form, that of the implicit is likewise absolute and essential — that is, the apprehension of what is experienced or the abrogation of this apparent other-being and the knowledge of the necessity of the thing through itself. It is now quite a matter of indifference whether anything is accepted as something experienced, as a succession of empirical ideas, if one may so say, or conceptions; or whether the succession is a succession of thoughts, *i.e.* implicitly existent.

Locke treats of the various kinds of these ideas imperfectly and empirically merely.

α. According to Locke simple ideas arise partly from outward, and partly from inward experience. For experiences, he says, are in the first place sensations; the other side is reflection, the inward determinations of consciousness.[218] From sensation, from the organs of sight for instance, the conceptions of colour, light, etc., arise; there further arises from outward experience the idea of impenetrability, of figure, rest, motion and such like. From reflections come the ideas of faith, doubt, judgment, reasoning, thinking, willing, etc.; from both combined, pleasure, pain, etc. This is a very commonplace account of the matter.

β. After Locke has presupposed experience, he goes on to say that it is the understanding which now discovers and desires the universal — the complex ideas. The Bishop of Worcester made the objection that “If the idea of substance be grounded upon plain and evident reason, then we must allow an idea of substance which comes not in by sensation or reflection.” Locke replies: “General ideas come not into the mind by sensation or reflection, but are the creatures or inventions of the understanding. The mind makes them from ideas which it has got by sensation and reflection.” The work of the mind now consists in bringing forth from several simple so-called ideas a number of new ones, by means of its working upon this material through comparing, distinguishing and contrasting it, and finally through separation or abstraction, whereby the universal conceptions, such as space, time, existence, unity and diversity, capacity, cause and effect, freedom, necessity, take their rise. “The mind in respect of its simple ideas is wholly passive, and receives them all from the existence and operation of things, such as sensation or reflection offers them, without being able to make any one idea.” But “the mind often exercises an active power in making these several combinations. For it being once furnished with simple ideas it can put them together in several combinations.” According to Locke therefore thought itself is not the essence of the soul, but one of its powers and manifestations. He maintains thought to be existent in consciousness as conscious thought, and thus brings it forward as a fact in his experience, that we do not always think. Experience demonstrates dreamless sleep when the sleep is profound. Locke quotes the example of a man who remembered no dream until he had reached his twenty-fifth year. It is as in the Xenien,

___ [219]

Oft schon war ich, und hab’ wirklich an gar nichts gedacht.

That is to say, my object is not a thought. But sensuous perception and recollection are thought, and thought is truth.[220] Locke, however, places the

reality of the understanding only in the formal activity of constituting new determinations from the simple conceptions received by means of perception, through their comparison and the combination of several into one; it is the apprehension of the abstract sensations which are contained in the objects. Locke likewise distinguishes (Bk. II. chap. xi. § 15-17) between pure and mixed modes. Pure modes are simple determinations such as power, number, infinitude; in such expressions as causality we reach, on the other hand, a mixed mode.

Locke now explains in detail the manner in which the mind, from the simple ideas of experience, reaches more complex ideas; but this derivation of general determinations from concrete perception is most unmeaning, trivial, tiresome and diffuse; it is entirely formal, an empty tautology. For instance we form the general conception of space from the perception of the distance of bodies by means of sight and feeling.[221] Or in other words, we perceive a definite space, abstract from it, and then we have the conception of space generally; the perception of distances gives us conceptions of space. This however is no deduction, but only a setting aside of other determinations; since distance itself is really space, mind thus determines space from space. Similarly we reach the notion of time through the unbroken succession of conceptions during our waking moments,[222] *i.e.* from determinate time we perceive time in general. Conceptions follow one another in a continual succession; if we set aside the particular element that is present we thereby receive the conception of time. Substance (which Locke does not accept in so lofty a sense as Spinoza), a complex idea, hence arises from the fact that we often perceive simple ideas such as blue, heavy, etc., in association with one another. This association we represent to ourselves as something which so to speak supports these simple ideas, or in which they exist.[223] Locke likewise deduces the general conception of power.[224] The determinations of freedom and necessity, cause and effect, are

then derived in a similar way. “In the notice that our senses take of the constant vicissitude of things, we cannot but observe, that several particulars, both qualities and substance, begin to exist; and that they receive this their existence from the due application and operation of some other being. From this observation we get our ideas of cause and effect,” for instance when wax is melted by the fire.[225] Locke goes on to say: “Every one, I think, finds in himself a power to begin or forbear, continue or put an end to several actions in himself. From the consideration of the extent of this power of the mind over the actions of the man, which every one finds in himself, arise the ideas of liberty and necessity.”[226]

We may say that nothing can be more superficial than this derivation of ideas. The matter itself, the essence, is not touched upon at all. A determination is brought into notice which is contained in a concrete relationship; hence the understanding on the one hand abstracts and on the other establishes conclusions. The basis of this philosophy is merely to be found in the transference of the determinate to the form of universality, but it was just this fundamental essence that we had to explain. As to this Locke confesses of space, for example, that he does not know what it really is.[227] This so-called analysis by Locke of complex conceptions, and his so-called explanation of the same, has, on account of its uncommon clearness and lucidity of expression, found universal acceptance. For what can be clearer than to say that we have the notion of time because we perceive time, if we do not actually see it, and that we conceive of space because we see it? The French have accepted this most readily and they have carried it further still; their *Idéologie* contains nothing more nor less.

γ. When Locke starts by saying that everything is experience and we abstract for ourselves from this experience general conceptions regarding objects and their qualities, he makes a distinction in respect of external qualities which was before this made by Aristotle (De anima, II. 6), and

which we likewise met with in Descartes (*supra*, pp. 245, 246). That is to say, Locke distinguishes between primary and secondary qualities; the first pertain to the objects themselves in truth, the others are not real qualities, but are founded on the nature of the organs of sensation. Primary qualities are mechanical, like extension, solidity, figure, movement, rest; these are qualities of the corporeal, just as thought is the quality of the spiritual. But the determinations of our individual feelings such as colours, sounds, smells, taste, etc., are not primary.[228] In Descartes' case this distinction has however another form, for the second class of these determinations is defined by him in such a way as that they do not constitute the essence of body, while Locke says that they exist for sensation, or fall within existence as it is for consciousness. Locke, however, no doubt reckons figure, etc., as still pertaining to reality, but by so doing nothing is ascertained as to the nature of body. In Locke a difference here appears between the implicit and being 'for-another,' in which he declares the moment of 'for-another' to be unreal — and yet he sees all truth in the relation of 'for-another' only.

c. Since the universal as such, the idea of species, is, according to Locke, merely a product of our mind, which is not itself objective, but relates merely to objects which are germane to it, and from which the particular of qualities, conditions, time, place, etc., are separated, Locke distinguishes essences into real essences and nominal essences; the former of these express the true essence of things, while species on the other hand are mere nominal essences which no doubt express something which is present in the objects, but which do not exhaust these objects. They serve to distinguish species for our knowledge, but the real essence of nature we do not know.[229] Locke gives good reasons for species being nothing in themselves — for their not being in nature, or absolutely determined — instancing in exemplification the production of monstrosities (Bk. III. chap. iii. § 17): were species absolute no monster would be born. But he overlooks the fact

that since it pertains to species to exist, it thereby likewise enters into relationship with other determinations; thus that is the sphere in which individual things operate upon one another, and may hence be detrimental to the existence of the species. Locke thus argues just as one would who wished to prove that the good does not exist in itself, because there are likewise evil men, that the circle does not exist absolutely in nature, because the circumference of a tree, for example, represents a very irregular circle, or because I draw a circle badly. Nature just signifies the lack of power to be perfectly adequate to the Notion; it is only in spirit that the Notion has its true existence. To say that species are nothing in themselves, that the universal is not the essential reality of nature, that its implicit existence is not the object of thought, is tantamount to saying that we do not know real existence: it is the same litany which has since been so constantly repeated that we are tired of listening to it:

Das Innere der Natur kennt kein erschaffener Geist,

and which goes on until we have perceived that Being-for-another, perception, is not implicit; a point of view which has not made its way to the positive position that the implicit is the universal. Locke is far back in the nature of knowledge, further back than Plato, because of his insistence on Being-for-another.

It is further noteworthy that from the sound understanding Locke argues (Vol. III. Bk. IV. chap. vii. § 8-11) against universal propositions or axioms such as that A = A, *i.e.* if anything is A it cannot be B. He says they are superfluous, of very little use or of no use at all, for nobody yet has built up a science on a proposition which asserts a contradiction. From such the true may be proved as easily as the false; they are tautological. What Locke has further achieved in respect of education, toleration, natural rights or universal state-right, does not concern us here, but has to do with general culture.

This is the philosophy of Locke, in which there is no trace of speculation. The great end of Philosophy, which is to know the truth, is in it sought to be attained in an empiric way; it thus indeed serves to draw attention to general determinations. But such a philosophy not only represents the standpoint of ordinary consciousness, to which all the determinations of its thought appear as if given, humble as it is in the oblivion of its activity, but in this method of derivation and psychological origination that which alone concerns Philosophy, the question of whether these thoughts and relationships have truth in and for themselves, is not present at all, inasmuch as the only object aimed at is to describe the manner in which thought accepts what is given to it. It may be held with Wolff that it is arbitrary to begin with concrete conceptions, as when our conception of identity is made to take its origin from such things as blue flowers and the blue heavens. One can better begin directly from universal conceptions and say that we find in our consciousness the conceptions of time, cause and effect; these are the later facts of consciousness. This method forms the basis of the Wolffian system of reasoning, only here we must still distinguish amongst the different conceptions those that are to be regarded as most essential; in Locke's philosophy, this distinction cannot really be said to come under consideration. From this time, according to Locke, or in this particular aspect of Philosophy, there is a complete and entire change in the point of view adopted; the whole interest is limited to the form in which the objective, or individual sensations, pass into the form of conceptions. In the case of Spinoza and Malebranche, we undoubtedly likewise saw that it was made a matter of importance to recognize this relation of thought to what is sensuously perceived, and thus to know it as falling into relation, as passing into the relative; the main question hence was: How are the two related? But the question was answered to the effect that it is only this relation for itself that constitutes the point of interest, and

this relation itself as absolute substance is thus identity, the true, God, it is not the related parts. The interest does not lie in the related parts; the related parts as one-sided are not the existent, presupposed and permanently established, they are accidental merely. But here the related sides, the things and the subject, have their proper value, and they are presupposed as having this value. Locke's reasoning is quite shallow; it keeps entirely to the phenomenal, to that which is, and not to that which is true.

There is another question however: Are these general determinations absolutely true? And whence come they not alone into my consciousness, into my mind and understanding, but into the things themselves? Space, cause, effect, etc., are categories. How do these categories come into the particular? How does universal space arrive at determining itself? This point of view, the question whether these determinations of the infinite, of substance, etc., are in and for themselves true, is quite lost sight of. Plato investigated the infinite and the finite, Being and the determinate, etc., and pronounced that neither of these opposites is of itself true; they are so only as together constituting an identity, wherever the truth of this content may come from. But here the truth as it is in and for itself is entirely set aside and the nature of the content itself is made the main point. It does not matter whether the understanding or experience is its source, for the question is whether this content is in itself true. With Locke, the truth merely signifies the harmony of our conceptions with things; here relation is alone in question, whether the content is an objective thing or a content of the ordinary conception. But it is quite another matter to investigate the content itself, and to ask, "Is this which is within us true?" We must not dispute about the sources, for the Whence, the only important point to Locke, does not exhaust the whole question. The interest of the content in and for itself wholly disappears when that position is taken up, and thereby the whole of what is aimed at by Philosophy is given up. On the other hand, when

thought is from the beginning concrete, when thought and the universal are synonymous with what is set before us, the question of the relation of the two which have been separated by thought is destitute of interest and incomprehensible. How does thought overcome the difficulties which itself has begotten? Here with Locke none at all have been begotten and awakened. Before the need for reconciliation can be satisfied, the pain of disunion must be excited.

The philosophy of Locke is certainly very comprehensible, but for that very reason it is likewise a popular philosophy to which the whole of the English philosophy as it exists at this day is allied; it is the thinking method of regarding things which is called philosophy carried to its perfection, the form which was introduced into the science which then took its rise in Europe. This is an important moment in culture; the sciences in general and specially the empiric sciences have to ascribe their origin to this movement. To the English, Philosophy has ever signified the deduction of experiences from observations; this has in a one-sided way been applied to physical and economic subjects. General principles of political economy such as free-trade in the present day, and all matters which rest on thinking experience, the knowledge of whatever reveals itself in this sphere as necessary and useful, signifies philosophy to the English (Vol. I. pp. 57, 58). The scholastic method of starting from principles and definitions has been rejected. The universal, laws, forces, universal matter, etc., have in natural science been derived from perceptions; thus to the English, Newton is held to be the philosopher κατ' ἐξοχήν. The other side is that in practical philosophy regarding society or the state, thought applies itself to concrete objects such as the will of the prince, subjects and their ends and personal welfare. Inasmuch as we have an object such as that before us, the indwelling and essential universal is made evident; it must, however, be made clear which conception is the one to which the others must yield. It is

in this way that rational politics took their rise in England, because the institutions and government peculiar to the English led them specially and in the first place to reflection upon their inward political and economic relationships. Hobbes must be mentioned as an exemplification of this fact. This manner of reasoning starts from the present mind, from what is our own, whether it be within or without us, since the feelings which we have, the experiences which fall directly within us, are the principles. This philosophy of reasoning thought is that which has now become universal, and through which the whole revolution in the position taken up by mind has come to pass.

2. Hugo Grotius.

Hugo Grotius was studying the laws of nations at the same time as Locke; and in him the very same methods may be found as those already mentioned, inasmuch as he also falls into a quite empirical system of associating nations with one another, combining with that an empirical mode of reasoning. Hugo van Groot, born 1583 at Delft, was a lawyer, fiscal general, and council pensionary; in 1619, however, he was implicated in the Barneveldt trial, and was compelled to fly the country. For a long time he remained in France, but in 1634 he entered the service of Queen Christina of Sweden. In 1635 he was made Swedish ambassador in Paris, and in 1645 he died at Rostock, while on a journey from Stockholm to Holland.[230] His principal work, *De jure belli et pacis*, he composed in 1625; now it is not read, but at one time it exercised a very great and important influence. In it Grotius presented a comparative historical account, the material of which was partly derived from the Old Testament, of the manner in which nations in the various relationships of war and peace have acted towards one another, and what usages they held to be binding. The following may serve as an example of his empirical method of reasoning:

Prisoners ought not to be killed; for the object is to disarm the enemy, and if this end be attained nothing further should be done.[231] This empirical way of connecting facts had the effect of bringing general comprehensible and rational principles into consciousness, of making them recognized, and of causing them to be more or less acceptable. Thus we see principles set forth, respecting the righteousness of a king's power for instance; for thought applied itself to everything. We are unsatisfied by such proofs and deductions, but we must not overlook what is thereby accomplished; and this is the establishment of principles which have their ultimate confirmation in the objects themselves, in mind and thought.

3. Thomas Hobbes.

Hobbes, who was celebrated and distinguished on account of the originality of his views, was tutor to the Earl of Devonshire; he was born in 1588 at Malmesbury, and died in 1679.[232] As a contemporary of Cromwell, he found in the events of that time, in the Revolution which then took place in England, an occasion for reflecting on the principles of state and law, and in fact he succeeded in making his way to quite original conceptions. He wrote much, including a treatise on Philosophy, entitled "The Elements of Philosophy." The first section (*Sectio*) of this work, *De corpore*, appeared in London in 1655; in it he first of all treats of Logic (*Pars* I.), and secondly of *philosophia prima* (*Pars* II.); this last is an ontology and metaphysic. The next sub-division (*Pars* III.), "On the relation between motion and magnitude," is a system of mechanism, a quite popular system of physics; and a study of the human organs. The second section was to treat of the nature of man (*De homine*), and the third of the state (*De cive*), but the intellectual sections of the work Hobbes did not entirely finish. He says in his preface that Copernicus first opened up astronomy, and Galileo physics,

before them there was nothing certain in either science. Harvey worked out the science of the human body, and physics generally as well as astronomy were perfected by Keppler. All this was termed Philosophy, in accordance with the point of view which has been already given (p. 313), since in it the reflective understanding desires to know the universal. Hobbes further says concerning the philosophy of the state (*philosophia civilis*), that it only dates from the publication of his book *De cive*.[233] This work, which appeared at Paris in 1642,[234] is, like his Leviathan, a much decried book; the second mentioned writing was forbidden to be circulated, and is hence very rare. Both works contain sounder reflections on the nature of society and government than many now in circulation. Society, the state, is to Hobbes absolutely pre-eminent, it is the determining power without appeal as regards law and positive religion and their external relations; and because he placed these in subjection to the state, his doctrines were of course regarded with the utmost horror. But there is nothing speculative or really philosophic in them, and there is still less in Hugo Grotius.

Before this ideals were set before us, or Holy Scripture or positive law was quoted as authoritative. Hobbes, on the contrary, sought to derive the bond which holds the state together, that which gives the state its power, from principles which lie within us, which we recognize as our own. In this way two opposite principles arise. The first is the passive obedience of subjects, the divine authority of rulers, whose will is absolute law, and is itself elevated above all other law. All this is represented in close connection with religion, and proved by examples from the Old Testament, by such stories as those of Saul and David. Criminal and marriage laws, too, for long derived their character from the Mosaic laws, or, speaking generally, from those the provisions of which possessed their value by the fact of being established by express divine command. On the other hand we have in the second place the reasoning wherein we ourselves are the

determining agents, and which was called sound reason. In the movement which Cromwell made use of there was allied with this a fanaticism, which from the written letter drew opposite conclusions to the above, and this we see exemplified in the equality of property, for instance. Hobbes, it is true, likewise maintained passive obedience, the absolute freedom of the royal will and power; but at the same time he sought to derive the principles of monarchical power, etc., from universal determinations. The views that he adopts are shallow and empirical, but the reasons he gives for them, and the propositions he makes respecting them, are original in character, inasmuch as they are derived from natural necessities and wants.

Hobbes maintained that "The origin of all society is to be found in the mutual fear of all its members;" it is hence a phenomenon in consciousness. "Each association is thus formed in its own interest or for its own renown, that is, from selfish motives." All such matters as security of life, property, and enjoyment, are not to be found outside it. "But men have in all dissimilarity of strength a natural similarity as well." This Hobbes proves by a characteristic reason, viz. that "each individual can make away with the other," each is the ultimate power over the others. "Each can be supreme."[235] Thus their similarity is not derived from the greatest strength; it is not, as in modern times, founded on the freedom of the spirit, or on an equality of merit and independence, but on the equal weakness of mankind; each man is weak as regards others.

b. Hobbes further takes up the position that this natural condition is of such a nature that all possess the desire to rule over one another. "All in their natural condition are possessed of the will to injure others," to tyrannize over other men; each has thus to fear the other. Hobbes looks at this condition in its true light, and we find in him no idle talk about a state of natural goodness; the natural condition is really far more like that of the animals — a condition in which there is an unsubdued individual will. All

thus wish to "secure themselves against the pretensions of others, to acquire for themselves advantages and superior rights. Opinions, religions, desires, arouse strife; the stronger bears away the victory. The natural condition is consequently a condition of mistrust on the part of all towards all; it is a war of all against all (*bellum omnium in omnes*)," and the endeavour of one to overreach another. The expression nature has a double significance: In the first place the nature of man signifies his spiritual and rational Being; but his natural condition indicates quite another condition, wherein man conducts himself according to his natural impulses. In this way he conducts himself in conformity with his desires and inclinations, while the rational, on the contrary, is the obtaining supremacy over the immediately natural. "In the condition of nature a certain irresistible power grants the right to rule over those who cannot resist; it is absurd to leave those whom we have in our power to become free and strong again." From this Hobbes draws the conclusion that "man must go forth from the natural condition."[236] This is true; the natural condition is not what it should be, and must hence be cast off.

c. Hobbes finally passes to the laws of reason which preserve tranquillity. This condition of law is the subjection of the natural, particular will of the individual to the universal will, which, however, is not that of all individuals, but is the will of the ruler; this is consequently not responsible to individuals, but is directed against this private will, and to it all must be obedient.[237] Thus the whole matter is now placed on quite another footing. But because the universal will is made to reside in the will of one monarch, there nevertheless proceeds from this point of view, which is really correct, a condition of absolute rule, of perfect despotism. The condition of law does not, however, mean that the arbitrary will of one man constitutes absolute law, for the universal will is no despotism, being rational, inasmuch as it is consistently expressed and determined in laws.

Rixner (Handbuch der Geschichte der Philosophie, Vol. III. p. 30) says: "Law to him is nothing but the sum of the conditions of peace extorted by iron necessity from the original wickedness of mankind." We might add that in Hobbes we at least find this, that the nature and organism of the State is established on the principle of human nature, human desire, &c. The English concerned themselves greatly with that principle of passive obedience, in accordance with which it is said that kings receive their power from God. This, in one aspect, is quite true, but in another it is falsely taken to mean that they have no responsibility, that their blind desires, their merely subjective will, is what must be obeyed.

4. Cudworth, Clarke, Wollaston.

Cudworth wished to revive Plato in England, but to do this after the manner of the demonstrations which we met with in Descartes, and through a trivial metaphysic of the understanding. He wrote a celebrated work: "The true intellectual System of the Universe," but the Platonic ideas expressed are often in a clumsy form and mingled with the Christian conceptions of God and angels — all regarded as particular existent things. What in Plato is mythical, is here taken as reality in the form of existence; this is reasoned about just as we reason respecting a matter of ordinary fact, such as whether it is probable that the French seek to effect a landing in England, and if so, whether they will successfully accomplish it. The Christian intellectual world is dragged down to the form of ordinary actuality, and consequently it is ruined.

The name of Clarke is likewise famous in connection with his proof of the existence of God. There were quite a number of other English philosophers, whom we do not, however, require to notice; for Clarke, Wollaston, and others carry on their speculations within forms such as belong to a very commonplace metaphysic of the understanding. The

manifold systems of moral philosophy which we find taking their rise in England are drawn up from this same mental standpoint; in them the implicitude of mind appears in a form of natural existence, namely, of desires and feelings. Their principles are found in moral sentiments, benevolent desires, sympathy, &c. That form alone is worthy of notice which, on the one hand, represents duty as something which is not foreign, given, commanded, but as clearly belonging to self-consciousness, even while, on the other hand, it represents this property as a natural, unconscious, unspiritual, and irrational existence. Impulse is blind, a solid existence which cannot get beyond itself like thinking self-consciousness. It is indeed true of impulse that its pure activity or its process, and the content, are, as in thought, immediately posited as the same; it has its content in itself, and this is not dead and passive, but self-acting and impelling. But that unity has the form of immediacy only as existent; in the first place it is not a knowledge, it is not necessary, for it is only taken from inward perception; in the second place, it is a determinate which does not abrogate itself, beyond which we cannot get, and which thus is not a universal. Impulse is no more an infinite than is the fixed category of force. Such reasoning takes the impulses in their determinate character from experience, and expresses the appearance of necessity in the same as an inward existence, as a force. For instance, the social instinct is a moment which is found in experience, because man derives all manner of utility from society. Wherein does the necessity of the State, of society, find its basis? In a social desire. This is cause, just as in the physical world a formal interpretation such as this is always to be found. The necessity of any existent fact, such as what pertains to electrical phenomena, finds its basis in a force which brings it forth; it is merely the form of returning from the external to an inward, of passing from the existent to what is thought, which is again in turn represented as an existent. Force is necessitated by reason of the

manifestation, we must argue from the latter to the former. On the other hand, the manifestation takes place through the force, for it is the cause of the manifestation; we hence have force in one place as reason, and in another as cause. But in all this there is no realization of the fact that in respect of form there is a transition from the Notion into Being and the other way, while in respect of content there is a perfect contingency of manifestation; we look at electricity in the same way as we look at the fact that men have social instincts, sympathetic inclinations, and so on.

5. Puffendorf.

In the struggle to give to just and equitable relations in the State an independent basis of their own, and to found a judicial system of government, reflective thought put forth its efforts; and this became to it a real interest and concern. And, as in the case of Grotius, it was also true of Puffendorf, that the instinct of mankind — that is, the social instinct, &c. — was made the principle. Samuel von Puffendorf was born in 1632 in Saxony; he studied public law, philosophy, and mathematics at Leipzig and Jena; in 1661, as a professor at Heidelberg, he made natural and civil law for the first time academic studies; in 1668 he became tutor in a Swedish family, which office he later on exchanged for the service of the House of Brandenburg, and in 1694 he died at Berlin as a privy councillor. He wrote several works on political law and history; we must specially mention his work, *De jure naturæ et gentium*, Libr. viii., Londin. Scan. 1672, 4; and also his compendium *De officio hominis*, published at the same place in 1673, 8, and *Elementa jurisprudentiæ universalis*.[238] While the divine right of kings was here still recognized — whereby they rendered account to God alone, or, at all events, were still bound to take counsel of the Church — the impulses and necessities present in mankind were now considered as well. These were regarded as the inward principles for private and political law,

and from them the duties both of the government and of rulers were deduced, so that the freedom of mankind might not be interfered with. The basis of the state in Puffendorf's view is the social instinct: the highest end of the state is the peace and security of social life through the transformation of inward duties as prescribed by conscience into external duties as compelled by law.[239]

6. Newton.

The other side is that thought likewise applied itself to nature, and in this connection Isaac Newton is famous by reason of his mathematical discoveries and his work in physics. He was born in 1642 at Cambridge, made a special study of mathematics, and became professor of the same at Cambridge; later on he was made president of the Royal Society in London, and he died in 1727.[240]

Newton was indisputably the chief contributor to the popularity of the philosophy of Locke, or the English method of treating of Philosophy, and more especially did he promote its application to all the physical sciences. "Physics, beware of metaphysics," was his maxim,[241] which signifies, Science, beware of thought; and all the physical sciences, even to the present day, have, following in his wake, faithfully observed this precept, inasmuch as they have not entered upon an investigation of their conceptions, or thought about thoughts. Physics can, however, effect nothing without thought; it has its categories and laws through thought alone, and without thought it does not effect any progress. Newton was mainly instrumental in introducing to physics the determinations respecting forces, which pertain to reflection; he raised science to the standpoint of reflection, and set the laws of forces in the place of the laws of phenomena. Regarding matters as he did, Newton derived his conclusions from his experiences; and in physics and the theory of colour-vision, he made bad

observations and drew worse conclusions. He passed from experiences to general points of view, again made them fundamental, and from them constructed the individual; this is how his theories are constructed. The observation of things, the discovery of the law immanent therein, and the universal which is found within them, has become the real point of interest. In this way, Newton is so complete a barbarian as regards his conceptions that his case is like that of another of his countrymen who was surprised and rejoiced to learn that he had talked prose all his life, not having had any idea that he was so accomplished. This Newton, like all the Physicists, indeed, never learned; he did not know that he thought in, and had to deal with Notions, while he imagined he was dealing with physical facts: and he presented the extremest contrast to Boehme, who handled sensuous things as Notions, and, by sheer force of mind, obtained entire possession of their actuality and subjugated them. Instead of this Newton treated Notions like sensuous things, and dealt with them just as men deal with wood and stone. And this is even now the case. In the beginnings of physical science we read of the power of inertia, for instance, of the force of acceleration, of molecules, of centripetal and centrifugal force, as of facts which definitely exist; what are really the final results of reflection are represented as their first grounds. If we ask for the cause of there being no advance made in such sciences, we find that it is because men do not understand that they should apply themselves to Notions, but make up their minds to adopt these determinations without sense or understanding. Hence in Newton's Optics, for instance, there are conclusions derived from his experience which are so untrue and devoid of understanding, that while they are set forth as the finest example of how men can learn to know nature by means of experiments and conclusions derived from experiments, they may also serve as an example of how we should neither experiment nor draw conclusions, of how nothing at all can be learned. A miserable kind of experience like

this itself contradicts itself through nature, for nature is more excellent than it appears in this wretched experience: both nature itself and experience, when carried a little further, contradict it. Hence, of all the splendid discoveries of Newton in optics, none now remain excepting one — the division of light into seven colours. This is partly because the conception of whole and part come into play, and partly from an obdurate closing of the eyes to the opposite side. From this empirical method in Philosophy, we shall now pass on to Leibnitz.

C. Third Section.

THE THIRD DEVELOPMENT of the philosophy of the understanding is that represented by Leibnitz and Wolff. If Wolff's metaphysics is divested of its rigid form, we have as a result the later popular philosophy.

1. Leibnitz.

As in other respects Leibnitz represents the extreme antithesis to Newton, so in respect of philosophy he presents a striking contrast to Locke and his empiricism, and also to Spinoza. He upholds thought as against the perception of the English school, and in lieu of sensuous Being he maintains Being for thought to be the essence of truth, just as Boehme at an earlier time upheld implicit Being. While Spinoza asserted the universality, the oneness of substance merely, and while with Locke we saw infinite determinations made the basis, Leibnitz, by means of his fundamental principle of individuality, brings out the essentiality of the opposite aspect of Spinoza's philosophy, existence for self, the monad, but the monad regarded as the absolute Notion, though perhaps not yet as the "I." The opposed principles, which were forced asunder, find their completion in each other, since Leibnitz's principle of individuation completed Spinoza's system as far as outward aspect goes.

Gottfried Wilhelm, Baron von Leibnitz, was born in 1646 at Leipzig, where his father was professor of Philosophy. The subject that he studied in view of a profession was jurisprudence, but first, in accordance with the fashion of the day, he made a study of Philosophy, and to it he devoted particular attention. To begin with, he picked up in Leipzig a large and

miscellaneous stock of knowledge, then he studied Philosophy and mathematics at Jena under the mathematician and theosophist Weigel, and took his degree of Master of Philosophy in Leipzig. There also, on the occasion of his graduation as Doctor of Philosophy, he defended certain philosophical theses, some of which discourses are still contained in his works (ed. Dutens, T. II. P. I. p. 400). His first dissertation, and that for which he obtained the degree of doctor of philosophy, was: *De principio individui*, — a principle which remained the abstract principle of his whole philosophy, as opposed to that of Spinoza. After he had acquired a thorough knowledge of the subject, he wished to graduate also as Doctor of Laws. But though he died an imperial councillor, it was his ill fortune to receive from the Faculty at Leipzig a refusal to confer the doctorate upon him, his youth being the alleged reason. Such a thing could scarcely happen now-a-days. It may be that it was done because of his over-great philosophical attainments, seeing that lawyers are wont to hold the same in horror. He now quitted Leipzig, and betook himself to Altdorf, where he graduated with distinction. Shortly afterwards he became acquainted in Nürnberg with a company of alchemists, with whose ongoings he became associated. Here he made extracts from alchemistic writings, and studied the mysteries of this occult science. His activity in the pursuit of learning extended also to historical, diplomatic, mathematical and philosophical subjects. He subsequently entered the service of the Elector of Mayence, becoming a member of council, and in 1672 he was appointed tutor to a son of Von Boineburg, Chancellor of State to the Elector. With this young man he travelled to Paris, where he lived for four years. He at this time made the acquaintance of the great mathematician Huygens, and was by him for the first time properly introduced into the domain of mathematics. When the education of his pupil was completed, and the Baron Von Boineburg died, Leibnitz went on his own account to London, where he became acquainted

with Newton and other scholars, at whose head was Oldenburg, who was also on friendly terms with Spinoza. After the death of the Elector of Mayence, the salary of Leibnitz ceased to be paid; he therefore left England and returned to France. The Duke of Brunswick-Lüneburg then took him into his service, and gave him the appointment of councillor and librarian at Hanover, with permission to spend as much time as he liked in foreign countries. He therefore remained for some time longer in France, England, and Holland. In the year 1677 he settled down in Hanover, where he became busily engaged in affairs of state, and was specially occupied with historical matters. In the Harz Mountains he had works constructed for carrying off the floods which did damage to the mines there. Notwithstanding these manifold occupations he invented the differential calculus in 1677, on occasion of which there arose a dispute between him and Newton, which was carried on by the latter and the Royal Society of London in a most ungenerous manner. For it was asserted by the English, who gave themselves the credit of everything, and were very unfair to others, that the discovery was really made by Newton. But Newton's *Principia* only appeared later, and in the first edition indeed Leibnitz was mentioned with commendation in a note which was afterwards omitted. From his headquarters in Hanover, Leibnitz, commissioned by his prince, made several journeys through Germany, and also went to Italy in order to collect historical evidence relative to the House of Este, and for the purpose of proving more clearly the relationship between this princely family and that of Brunswick-Lüneburg. At other times he was likewise much occupied with historical questions. Owing to his acquaintance with the consort of Frederick I. of Prussia, Sophia Charlotte, a Hanoverian princess, he was enabled to bring about the foundation of an Academy of Science in Berlin, in which city he lived for a considerable time. In Vienna he also became acquainted with Prince Eugène, which occasioned his being appointed

finally an Imperial Councillor. He published several very important historical works as the result of this journey. His death took place at Hanover in 1716, when he was seventy years of age.[242]

It was not only on Philosophy, but also on the most varied branches of science that Leibnitz expended toil and trouble and energy; it was to mathematics, however, that he specially devoted his attention, and he is the inventor of the methods of the integral and differential calculus. His great services in regard to mathematics and physics we here leave out of consideration, and pay attention to his philosophy alone. None of his books can be exactly looked on as giving a complete systematic account of his philosophy. To the more important among them belongs his work on the human understanding (*Nouveaux essais sur l'entendement humain*) in reply to Locke; but this is a mere refutation. His philosophy is therefore scattered through various little treatises which were written in very various connections, in letters, and replies to objections which caused him to bring out one aspect of the question more strongly than another; we consequently find no elaborated systematic whole, superintended or perfected by him. The work which has some appearance of being such, his *Théodicée*, better known to the public than anything else he wrote, is a popular treatise which he drew up for Queen Sophia Charlotte in reply to Bayle, and in which he took pains not to present the matter in very speculative form. A Wurtemberg theologian, Pfaff by name, and others who were correspondents of Leibnitz and were themselves only too well versed in philosophy, brought it as a charge against Leibnitz — a charge which he never denied — that his philosophy was written in popular form.[243] They laughed very much afterwards at Wolff, who had taken them to be quite in earnest; his opinion was that if Leibnitz were not perfectly serious in this sense with his *Théodicée*, yet he had unconsciously written his best therein. Leibnitz's *Théodicée* is not what we can altogether appreciate; it is a

justification of God in regard to the evil in the world. His really philosophic thoughts are most connectedly expressed in a treatise on the principles of Grace (*Principes de la Nature et de la Grace*),[244] and especially in the pamphlet addressed to Prince Eugène of Savoy.[245] Buhle (Geschichte der neuern Philosophie, vol. iv. section 1, p. 131) says: "His philosophy is not so much the product of free, independent, original speculation, as the result of well-tested earlier" and later "systems, an eclecticism whose defects he tried to remedy in his own way. It is a desultory treatment of Philosophy in letters."

Leibnitz followed the same general plan in his philosophy as the physicists adopt when they advance a hypothesis to explain existing data. He has it that general conceptions of the Idea are to be found, from which the particular may be derived; here, on account of existing data, the general conception, for example the determination of force or matter furnished by reflection, must have its determinations disposed in such a way that it fits in with the data. Thus the philosophy of Leibnitz seems to be not so much a philosophic system as an hypothesis regarding the existence of the world, namely how it is to be determined in accordance with the metaphysical determinations and the data and assumptions of the ordinary conception, which are accepted as valid[246] — thoughts which are moreover propounded without the sequence pertaining to the Notion and mainly in narrative style, and which taken by themselves show no necessity in their connection. Leibnitz's philosophy therefore appears like a string of arbitrary assertions, which follow one on another like a metaphysical romance; it is only when we see what he wished thereby to avoid that we learn to appreciate its value. He really makes use of external reasons mainly in order to establish relations: "Because the validity of such relations cannot be allowed, nothing remains but to establish the matter in this way." If we are not acquainted with these reasons, this procedure strikes us as arbitrary.

a. Leibnitz's philosophy is an idealism of the intellectuality of the universe; and although from one point of view he stands opposed to Locke, as from another point of view he is in opposition to the Substance of Spinoza, he yet binds them both together again. For, to go into the matter more particularly, on the one hand he expresses in the many monads the absolute nature of things distinguished and of individuality; on the other hand, in contrast to this and apart from it, he expresses the ideality of Spinoza and the non-absolute nature of all difference, as the idealism of the popular conception. Leibnitz's philosophy is a metaphysics, and in sharp contrast to the simple universal Substance of Spinoza, where all that is determined is merely transitory, it makes fundamental the absolute multiplicity of individual substances, which after the example of the ancients he named monads — an expression already used by the Pythagoreans. These monads he then proceeds to determine as follows.

Firstly "Substance is a thing that is capable of activity, it is compound or simple, the compound cannot exist without the simple. The monads are simple substances." The proof that they constitute the truth in all things is very simple, it is a superficial reflection. For instance, one of Leibnitz's maxims is "Because there are compound things, the principles of the same must be simple, for the compound consists of the simple."[247] This proof is poor enough, it is an example of the favourite way of starting from something definite, say the compound, and then drawing conclusions therefrom as to the simple. It is quite light in a way, but really it is tautology. Of course, if the compound exists, so does the simple, for the compound means something in itself manifold whose connection or unity is external. From the very trivial category of the compound it is easy to deduce the simple. It is a conclusion drawn from a certain premiss, but the question is whether the premiss is true. These monads are not, however, something abstract and simple in itself, like the empty Epicurean atoms,

which, as they were in themselves lacking in determination, drew all their determination from their aggregation alone. The monads are, on the contrary, substantial forms, a good expression, borrowed from the Scholastics (*supra*, p. 71), or the metaphysical points of the Alexandrian School (Vol II. p. 439), they are the entelechies of Aristotle taken as pure activity, which are forms in themselves (Vol II. pp. 138, 182, 183). "These monads are not material or extended, nor do they originate or decay in the natural fashion, for they can begin only by a creative act of God, and they can end only by annihilation."[248] Thereby they are distinguished from the atoms, which are regarded simply as principles. The expression creation we are familiar with from religion, but it is a meaningless word derived from the ordinary conception; in order to be a thought and to have philosophic significance, it must be much more closely defined.

Secondly: "On account of their simplicity the monads are not susceptible of alteration by another monad in their inner essence; there is no causal connection between them." Each of them is something indifferent and independent as regards the rest, otherwise it would not be an entelechy. Each of them is so much for itself that all its determinations and modifications go on in itself alone, and no determination from without takes place. Leibnitz says: "There are three ways in which substances are connected: (1) Causality, influence; (2) The relation of assistance; (3) The relation of harmony. The relation of influence is a relation pertaining to a commonplace or popular philosophy. But as it is impossible to understand how material particles or immaterial qualities can pass from one substance into another, such a conception as this must be abandoned." If we accept the reality of the many, there can be no transition at all; each is an ultimate and absolutely independent entity. "The system of assistance," according to Descartes, "is something quite superfluous, a *Deus ex machina*, because continual miracles in the things of nature are assumed." If we, like

Descartes, assume independent substances, no causal nexus is conceivable; for this presupposes an influence, a bearing of the one upon the other, and in this way the other is not a substance. "Therefore there remains only harmony, a unity which is in itself or implicit. The monad is therefore simply shut up in itself, and cannot be determined by another; this other cannot be set into it. It can neither get outside itself, nor can others get inside it."[249] That is also Spinoza's way of regarding matters: each attribute entirely represents the essence of God for itself, extension and thought have no influence on each other.

In the third place, "however, these monads must at the same time have certain qualities or determinations in themselves, inner actions, through which they are distinguished from others. There cannot be two things alike, for otherwise they would not be two, they would not be different, but one and the same."[250] Here then Leibnitz's axiom of the undistinguishable comes into words. What is not in itself distinguished is not distinguished. This may be taken in a trivial sense, as that there are not two individuals which are alike. To such sensuous things the maxim has no application, it is *prima facie* indifferent whether there are things which are alike or not; there may also be always a difference of space. This is the superficial sense, which does not concern us. The more intimate sense is, however, that each thing is in itself something determined, distinguishing itself from others implicitly or in itself. Whether two things are like or unlike is only a comparison which we make, which falls within our ken. But what we have further to consider is the determined difference in themselves. The difference must be a difference in themselves, not for our comparison, for the subject must have the difference as its own peculiar characteristic or determination, *i.e.* the determination must be immanent in the individual. Not only do we distinguish the animal by its claws, but it distinguishes itself essentially thereby, it defends itself, it preserves itself. If two things are

different only in being two, then each of them is one; but the fact of their being two does not constitute a distinction between them; the determined difference in itself is the principal point.

Fourthly: “The determinateness and the variation thereby established is, however, an inward implicit principle; it is a multiplicity of modifications, of relations to surrounding existences, but a multiplicity which remains locked up in simplicity. Determinateness and variation such as this, which remains and goes on in the existence itself, is a perception;” and therefore Leibnitz says all monads perceive or represent (for we may translate *perceptio* by representation [Vorstellung]). In other words, they are in themselves universal, for universality is just simplicity in multiplicity, and therefore a simplicity which is at the same time change and motion of multiplicity. This is a very important determination; in substance itself there is negativity, determinateness, without its simplicity and its implicitude being given up. Further, in it there is this idealism, that the simple is something in itself distinguished, and in spite of its variation, that it yet remains one, and continues in its simplicity. An instance of this is found in “I,” my spirit. I have many conceptions, a wealth of thought is in me, and yet I remain one, notwithstanding this variety of state. This identity may be found in the fact that what is different is at the same time abrogated, and is determined as one; the monads are therefore distinguished by modifications in themselves, but not by external determinations. These determinations contained in the monads exist in them in ideal fashion; this ideality in the monad is in itself a whole, so that these differences are only representations and ideas. This absolute difference is what is termed the Notion; what falls asunder in the mere representation is held together. This is what possesses interest in Leibnitz’s philosophy. Such ideality in the same way pertains to the material, which is also a multiplicity of monads; therefore the system of Leibnitz is an intellectual system, in accordance with which all that is

material has powers of representation and perception. As thus representing, the monad, says Leibnitz, possesses activity; for activity is to be different, and yet to be one, and this is the only true difference. The monad not only represents, it also changes; but in doing so, it yet remains in itself absolutely what it is. This variation is based on activity. “The activity of the inner principle, by means of which it passes from one perception to another, is desire (*appetitus*).” Variation in representation is desire, and that constitutes the spontaneity of the monad; all is now complete in itself, and the category of influence falls away. Indeed, this intellectuality of all things is a great thought on the part of Leibnitz: “All multiplicity is included in unity;”[251] determination is not a difference in respect of something else, but reflected into itself, and maintaining itself. This is one aspect of things, but the matter is not therein complete; it is equally the case that it is different in respect of other things.

Fifthly: These representations and ideas are not necessarily conscious representations and ideas, any more than all monads as forming representations are conscious. It is true that consciousness is itself perception, but a higher grade of the same; perceptions of consciousness Leibnitz calls apperceptions. The difference between the merely representing and the self-conscious monads Leibnitz makes one of degrees of clearness. The expression representation has, however, certainly something awkward about it, since we are accustomed to associate it only with consciousness, and with consciousness as such; but Leibnitz admits also of unconscious representation. When he then adduces examples of unconscious representations, he appeals to the condition of a swoon or of sleep, in which we are mere monads: and that representations without consciousness are present in such states he shows from the fact of our having perceptions immediately after awakening out of sleep, which shows

that others must have been there, for one perception arises only out of others.[252] That is a trivial and empirical demonstration.

Sixthly: These monads constitute the principle of all that exists. Matter is nothing else than their passive capability. This passive capability it is which constitutes the obscurity of the representations, or a confusion which never arrives at distinction, or desire, or activity.[253] That is a correct definition of the conception; it is Being, matter, in accordance with the moment of simplicity. This is implicitly activity; "mere implicitness without actualization" would therefore be a better expression. The transition from obscurity to distinctness Leibnitz exemplifies by the state of swooning.

Seventhly: Bodies as bodies are aggregates of monads: they are mere heaps which cannot be termed substances, any more than a flock of sheep can bear this name.[254] The continuity of the same is an arrangement or extension, but space is nothing in itself;[255] it is only in another, or a unity which our understanding gives to that aggregate.[256]

b. Leibnitz goes on to determine and distinguish more clearly as the principal moments, inorganic, organic, and conscious monads, and he does it in the following way.

α. Such bodies as have no inner unity, whose elements are connected merely by space, or externally, are inorganic; they have not an entelechy or one monad which rules over the rest.[257] The continuity of space as a merely external relation has not the Notion in itself of the likeness of these monads in themselves. Continuity is in fact to be regarded in them as an arrangement, a similarity in themselves. Leibnitz therefore defines their movements as like one another, as a harmony in themselves;[258] but again, this is as much as saying that their similarity is not in themselves. In fact continuity forms the essential determination of the inorganic; but it must at the same time not be taken as something external or as likeness, but as penetrating or penetrated unity, which has dissolved individuality in itself

like a fluid. But to this point Leibnitz does not attain, because for him monads are the absolute principle, and individuality does not annul itself.

β. A higher degree of Being is found in bodies with life and soul, in which one monad has dominion over the rest. The body which is bound up with the monad, of which the one monad is the entelechy or soul, is with this soul named a living creature, an animal. One such entelechy rules over the rest, yet not really, but formally: the limbs of this animal, however, are again themselves such living things, each of which has in its turn its ruling entelechy within it.[259] But ruling is here an inappropriate expression. To rule in this case is not to rule over others, for all are independent; it is therefore only a formal expression. If Leibnitz had not helped himself out with the word rule, and developed the idea further, this dominant monad would have abrogated the others, and put them in a negative position; the implicitness of the other monads, or the principle of the absolute Being of these points or individuals would have disappeared. Yet we shall later on come across this relation of the individuals to one another.

γ. The conscious monad distinguishes itself from the naked (material) monads by the distinctness of the representation. But this is of course only an indefinite word, a formal distinction; it indicates that consciousness is the very thing that constitutes the distinction of the undistinguished, and that distinction constitutes the determination of consciousness. Leibnitz more particularly defined the distinction of man as that "he is capable of the knowledge of necessary and eternal truths," — or that he conceives the universal on the one hand, and on the other what is connected with it; the nature and essence of self-consciousness lies in the universality of the Notions. "These eternal truths rest on two maxims; the one is that of contradiction, the other is that of sufficient reason." The former of these is unity expressed in useless fashion as a maxim, the distinction of the undistinguishable, A = A; it is the definition of thinking, but not a maxim

which could contain a truth as content, or it does not express the Notion of distinction as such. The other important principle was, on the other hand: What is not distinguished in thought is not distinguished (p. 333). “The maxim of the reason is that everything has its reason,”[260] — the particular has the universal as its essential reality. Necessary truth must have its reason in itself in such a manner that it is found by analysis, *i.e.* through that very maxim of identity. For analysis is the very favourite plan of resolving into simple ideas and principles: a resolution which annihilates their relation, and which therefore in fact forms a transition into the opposite, though it does not have the consciousness of the same, and on that account also excludes the Notion; for every opposite it lays hold of only in its identity. Sufficient reason seems to be a pleonasm; but Leibnitz understood by this aims, final causes (*causæ finales*), the difference between which and the causal nexus or the efficient cause he here brings under discussion.[261]

c. The universal itself, absolute essence, which with Leibnitz is something quite different from the monads, separates itself also into two sides, namely universal Being and Being as the unity of opposites.

α. That universal is God, as the cause of the world, to the consciousness of whom the above principle of sufficient reason certainly forms the transition. The existence of God is only an inference from eternal truths; for these must as the laws of nature have a universal sufficient reason which determines itself as none other than God. Eternal truth is therefore the consciousness of the universal and absolute in and for itself; and this universal and absolute is God, who, as one with Himself, the monad of monads, is the absolute *Monas*. Here we again have the wearisome proof of His existence: He is the fountain of eternal truths and Notions, and without Him no potentiality would have actuality; He has the prerogative of existing immediately in His potentiality.[262] God is here also the unity of potentiality and actuality, but in an uncomprehending manner; what is necessary, but not

comprehended, is transferred to Him. Thus God is at first comprehended chiefly as universal, but already in the aspect of the relation of opposites.

β. As regards this second aspect, the absolute relation of opposites, it occurs in the first place in the form of absolute opposites of thought, the good and the evil. "God is the Author of the world," says Leibnitz; that refers directly to evil. It is round this relation that philosophy specially revolves, but to the unity of which it did not then attain; the evil in the world was not comprehended, because no advance was made beyond the fixed opposition. The result of Leibnitz's Théodicée is an optimism supported on the lame and wearisome thought that God, since a world had to be brought into existence, chose out of infinitely many possible worlds the best possible — the most perfect, so far as it could be perfect, considering the finite element which it was to contain.[263] This may very well be said in a general way, but this perfection is no determined thought, but a loose popular expression, a sort of babble respecting an imaginary or fanciful potentiality; Voltaire made merry over it. Nor is the nature of the finite therein defined. Because the world, it is said, has to be the epitome of finite Beings, evil could not be separated from it, since evil is negation, finitude.[264] Reality and negation remain standing in opposition to one another exactly in the same way as before. That is the principal conception in the Théodicée. But something very like this can be said in every-day life. If I have some goods brought to me in the market at some town, and say that they are certainly not perfect, but the best that are to be got, this is quite a good reason why I should content myself with them. But comprehension is a very different thing from this. Leibnitz says nothing further than that the world is good, but there is also evil in it; the matter remains just the same as it was before. "Because it had to be finite" is then a mere arbitrary choice on the part of God. The next question would be: Why and how is there finitude in the Absolute and His decrees? And only then should there be

deduced from the determination of finitude the evil which no doubt exists therein.

It is true that Leibnitz has a reply to the above question: "God does not will what is evil; evil comes only indirectly into the results" (blind), "because oftentimes the greater good could not be achieved if evils were not present. Therefore they are means to a good end." But why does not God employ other means? They are always external, not in and for themselves. "A moral evil may not be regarded as a means, nor must we, as the apostle says, do evil that good may come; yet it has often the relation of a *conditio sine qua non* of the good. Evil is in God only the object of a permissive will (*voluntatis permissivæ*);" but everything that is wrong would be such. "God has therefore among the objects of His will the best possible as the ultimate object, but the good as a matter of choice (*qualemcunque*), also as subordinate; and things indifferent and evils often as means. Evil is, however, an object of His will only as the condition of something otherwise necessary (*rei alioqui debitæ*), which without it could not exist; in which sense Christ said it must needs be that offences come."[265]

In a general sense we are satisfied with the answer: "In accordance with the wisdom of God we must accept it as a fact that the laws of nature are the best possible," but this answer does not suffice for a definite question. What one wishes to know is the goodness of this or that particular law; and to that no answer is given. If, for example, it is said that "The law of falling bodies, in which the relation of time and space is the square, is the best possible," one might employ, as far as mathematics are concerned, any other power whatever. When Leibnitz answers: "God made it so," this is no answer at all. We wish to know the definite reason of this law; such general determinations sound pious, but are not satisfying.

γ. He goes on to say that the sufficient reason has reference to the representation of the monads. The principles of things are monads, of which each is for itself, without having influence on the others. If now the Monad of monads, God, is the absolute substance, and individual monads are created through His will, their substantiality comes to an end. There is therefore a contradiction present, which remains unsolved in itself — that is between the one substantial monad and the many monads for which independence is claimed, because their essence consists in their standing in no relation to one another. Yet at the same time, in order to show the harmony that exists in the world, Leibnitz understands the relation of monads to monads more generally as the unity of contrasted existences, namely of soul and body. This unity he represents as a relation without difference, and notionless, *i.e.* as a pre-established harmony.[266] Leibnitz uses here the illustration of two clocks, which are set to the same hour, and keep the same time;[267] in the same way the movement of the kingdom of thought goes on, determined in accordance with ends, and the movement onward of the corporeal kingdom which corresponds with it, proceeds according to a general causal connection.[268] The case is the same as with Spinoza, that these two sides of the universe have no connection with each other, the one does not influence the other, but both are entirely indifferent to one another; it is really the differentiating relation of the Notion that is lacking. In abstract thought that is without Notion, that determination now receives the form of simplicity, of implicitude, of indifference with regard to what is other, of a self-reflection that has no movement: in this way red in the abstract is in a position of indifference as regards blue, &c. Here, as before, Leibnitz forsakes his principle of individuation; it has only the sense of being exclusively one, and of not reaching to and including what is other; or it is only a unity of the popular conception, not the Notion of unity. The soul has thus a series of conceptions and ideas which are developed from

within it, and this series is from the very first placed within the soul at its creation, *i.e.* the soul is in all immediacy this implicit determination; determination is, however, not implicit, but the reflected unfolding of this determination in the ordinary conception is its outward existence. Parallel with this series of differentiated conceptions, there now runs a series of motions of the body, or of what is external to the soul.[269] Both are essential moments of reality; they are mutually indifferent, but they have also an essential relation of difference.

Since now every monad, as shut up within itself, has no influence upon the body and its movements, and yet the infinite multitude of their atoms correspond with one another, Leibnitz places this harmony in God; a better definition of the relation and the activity of the Monad of monads is therefore that it is what pre-establishes harmony in the changes of the monads.[270] God is the sufficient reason, the cause of this correspondence; He has so arranged the multitude of atoms that the original changes which are developed within one monad correspond with the changes of the others. The pre-established harmony is to be thought of somewhat in this style; when a dog gets a beating, the pain develops itself in him, in like fashion the beating develops itself in itself, and so does the person who administers the beating: their determinations all correspond with one another, and that not by means of their objective connection, since each is independent.[271] The principle of the harmony among the monads does not consequently belong to them, but it is in God, who for that very reason is the Monad of monads, their absolute unity. We saw from the beginning how Leibnitz arrived at this conception. Each monad is really possessed of the power of representation, and is as such a representation of the universe, therefore implicitly the totality of the whole world. But at the same time this representation is not in consciousness; the naked monad is implicitly the universe, and difference is the development of this totality in it.[272] What

develops itself therein is at the same time in harmony with all other developments; all is one harmony. “In the universe all things are closely knit together, they are in one piece, like an ocean: the slightest movement transmits its influence far and wide all around.”[273] From a single grain of sand, Leibnitz holds, the whole universe might be comprehended in its entire development — if we only knew the sand grain thoroughly. There is not really much in all this, though it sounds very fine; for the rest of the universe is considerably more than a grain of sand, well though we knew it, and considerably different therefrom. To say that its essence is the universe is mere empty talk: for the fact is that the universe as essence is not the universe. To the sand grain much must be added which is not present; and since thought adds more than all the grains of sand that exist, the universe and its development may in this way certainly be comprehended. Thus according to Leibnitz every monad has or is the representation of the entire universe, which is the same as saying that it is really representation in general; but at the same time it is a determinate representation, by means of which it comes to be this particular monad, therefore it is representation according to its particular situation and circumstances.[274]

The representations of the monad in itself, which constitute its universe, develop themselves from themselves, as the spiritual element in it, according to the laws of their own activity and desire, just as the movements of their outer world do according to laws of bodies; hence liberty is nothing other than this spontaneity of immanent development, but as in consciousness. The magnetic needle, on the contrary, has only spontaneity without consciousness, and consequently without freedom. For, says Leibnitz, the nature of the magnetic needle is to turn to the north; if it had consciousness it would imagine that this was its self-determination; it would thus have the will to move round in accordance with its nature.[275] But it is clear that in the course of conscious representations there is involved no

necessary connection, but contingency and want of sequence are to be found, the reason of this according to Leibnitz (Oper. T. II P. I. p. 75) being "because the nature of a created substance implies that it changes incessantly according to a certain order, which order guides it spontaneously (*spontanément*) in all the circumstances which befall it; so that one who sees all things recognizes in the present condition of substance the past also and the future. The law of order, which determines the individuality of the particular substance, has an exact reference to what takes place in every other substance and in the whole universe." The meaning of this is that the monad is not a thing apart, or that there are two views of it, the one making it out as spontaneously generating its representations, so far as form is concerned, and the other making it out to be a moment of the whole of necessity; Spinoza would call this regarding it from both sides. An organic whole, a human being, is thus for instance the assertion of his aim from out of himself: at the same time the being directed on something else is involved in his Notion. He represents this and that to himself, he wills this and that; his activity employs itself and brings about changes. His inward determination thus becomes corporeal determination, and then change going beyond himself; he appears as cause, influencing other monads. But this Being-for-another is only an appearance. For the other, *i.e.* the actual, in so far as the monad determines it or makes it negative, is the passive element which the monad has in itself: all moments are indeed contained therein, and for that very reason it has no need of other monads, but only of the laws of the monads in itself. But if the Being-for-another is mere appearance, the same may be said of Being-for-self; for this has significance only in reference to Being-for-another.

The important point in Leibnitz's philosophy is this intellectuality of representation which Leibnitz, however, did not succeed in carrying out; and for the same reason this intellectuality is at the same time infinite

multiplicity, which has remained absolutely independent, because this intellectuality has not been able to obtain mastery over the One. The separation in the Notion, which proceeds as far as release from itself, or appearance in distinct independence, Leibnitz did not succeed in bringing together into unity. The harmony of these two moments, the course of mental representations and the course of things external, appearing mutually as cause and effect, is not brought by Leibnitz into relation in and for themselves; he therefore lets them fall asunder, although each is passive as regards the other. He moreover considers both of them in one unity, to be sure, but their activity is at the same time not for themselves. Every forward advance becomes therefore incomprehensible when taken by itself, because the course of the representation as through aims in itself, requires this moment of Other-Being or of passivity; and again the connection of cause and effect requires the universal: each however lacks this its other moment. The unity which according to Leibnitz is to be brought about by the pre-established harmony, namely that the determination of the will of man and the outward change harmonize, is therefore brought about by means of another, if not indeed from without, for this other is God. Before God the monads are not to be independent, but ideal and absorbed in Him.

At this point the demand would come in that in God Himself there should be comprehended the required unity of that which before fell asunder; and God has the special privilege of having laid on Him the burden of what cannot be comprehended. The word of God is thus the makeshift which leads to a unity which itself is only hypothetical; for the process of the many out of this unity is not demonstrated. God plays therefore in the later philosophy a far greater part than in the early, because now the comprehension of the absolute opposition of thought and Being is the chief demand. With Leibnitz the extent to which thoughts advance is the extent of the universe; where comprehension ceases, the universe ceases, and God

begins: so that later it was even maintained that to be comprehended was derogatory to God, because He was thus degraded into finitude. In that procedure a beginning is made from the determinate, this and that are stated to be necessary; but since in the next place the unity of these moments is not comprehended, it is transferred to God. God is therefore, as it were, the waste channel into which all contradictions flow: Leibnitz's Théodicée is just a popular summing up such as this. There are, nevertheless, all manner of evasions to be searched out — in the opposition of God's justice and mercy, that the one tempers the other; how the fore-knowledge of God and human freedom are compatible — all manner of syntheses which never come to the root of the matter nor show both sides to be moments.

These are the main moments of Leibnitz's philosophy. It is a metaphysic which starts from a narrow determination of the understanding, namely, from absolute multiplicity, so that connection can only be grasped as continuity. Thereby absolute unity is certainly set aside, but all the same it is presupposed; and the association of individuals with one another is to be explained only in this way, that it is God who determines the harmony in the changes of individuals. This is an artificial system, which is founded on a category of the understanding, that of the absoluteness of abstract individuality. What is of importance in Leibnitz lies in the maxims, in the principle of individuality and the maxim of indistinguishability.

2. Wolff.

The philosophy of Wolff is directly connected with that of Leibnitz, for really it is a pedantic systematization of the latter, for which reason it is likewise called the Leibnitz-Wolffian system of philosophy. Wolff attained to great distinction in mathematics and made himself famous by his philosophy as well; the latter was for long predominant in Germany. In Wolff, as a teacher dealing with the understanding, we find a systematic

exposition of the philosophic element present in human conceptions as a whole. As regards his connection with German culture generally, great and immortal praise is more especially due to him; before all others he may be termed the teacher of the Germans. We may indeed say that Wolff was the first to naturalize philosophy in Germany. Tschirnhausen and Thomasius likewise participated in this honour, for the special reason that they wrote upon Philosophy in the German language. In regard to the matter of the philosophy of Tschirnhausen and Thomasius we have not much to say; it is so-called healthy reason — there is in it the superficial character and the empty universality always to be found where a beginning is made with thought. In this case the universality of thought satisfies us because everything is present there, just as it is present in a moral maxim which has, however, no determinate content in its universality. Wolff, then, was the first to make, not exactly Philosophy, but thoughts in the form of thought, into a general possession, and he substituted this in Germany for mere talk originating from feeling, from sensuous perception, and from the ordinary conception. This is most important from the point of view of culture, and yet it does not really concern us here, excepting in so far as the content in this form of thought has caused itself to be recognized as Philosophy. This philosophy, as a philosophy of the understanding, became the ordinary culture of the day; in it determinate, intelligent thought is the fundamental principle, and it extends over the whole circle of objects which fall within the region of knowledge. Wolff defined the world of consciousness for Germany, and for the world in general, in the same wide sense in which we may say that this was done by Aristotle. What distinguishes him from Aristotle is that in so doing the point of view that he adopted was that of the understanding merely, while Aristotle treated the subject speculatively. The philosophy of Wolff is hence no doubt built on foundations laid by Leibnitz, but yet in such a manner that the speculative interest is quite eliminated

from it. The spiritual philosophy, substantial in a higher sense, which we found emerging first in Boehme, though still in a peculiar and barbarous form, has been quite lost sight of, and has disappeared without leaving any traces or effects in Germany; his very language was forgotten.

The principal events in Christian Wolff's life are these: He was the son of a baker, and was born at Breslau in 1679. He first studied Theology and then Philosophy, and in 1707 he became Professor of Mathematics and Philosophy at Halle. Here the pietistic theologians, and more especially Lange, treated him in the basest manner. Piety did not trust this understanding; for piety, if it is true, embodies a content which is speculative in nature, and which passes beyond the understanding. As his opponents could make no headway by their writings, they resorted to intrigues. They caused it to be conveyed to King Frederick William I., the father of Frederick II., a rough man who took an interest in nothing but soldiers, that according to the determinism of Wolff, free will was impossible, and that soldiers could not hence desert of their own free will, but by a special disposition of God (pre-established harmony) — a doctrine which, if disseminated amongst the military, would be extremely dangerous. The king, much enraged by this, immediately issued a decree that within forty-eight hours Wolff should leave Halle and the Prussian States, under penalty of the halter. Wolff thus left Halle on the 23rd of November, 1723. The theologians added to all this the scandal of preaching against Wolff and his philosophy, and the pious Franke thanked God on his knees in church for the removal of Wolff. But the rejoicings did not last long. Wolff went to Cassel, was there immediately installed first professor in the philosophic faculty at Marburg, and at the same time made a member of the Academies of Science of London, Paris, and Stockholm. By Peter the First of Russia he was made Vice-President of the newly instituted Academy in St. Petersburg. Wolff was also summoned to Russia, but this invitation he declined; he

received, however, an honorary post, he was made a Baron by the Elector of Bavaria, and, in short, loaded with public honours which, more especially at that time, though even now it is the case, were very much thought of by the general public, and which were too great not to make a profound sensation in Berlin. In Berlin a commission was appointed to pass judgment on the Wolffian philosophy — for this it had not been possible to eradicate — and it declared the same to be harmless, that is to say, free from all danger to state and religion; it also forbade the theologians to make it a subject of dispute, and altogether put an end to their clamour. Frederick William now issued a recall in very respectful terms to Wolff, who, however, hesitated to comply with it owing to his lack of confidence in its sincerity. On the accession of Frederick II. in 1740 he was again recalled in terms of the highest honour (Lange had meanwhile died), and only then did he comply. Wolff became Vice-Chancellor of the University, but he outlived his repute, and his lectures at the end were very poorly attended. He died in 1754.[276]

Like Tschirnhausen and Thomasius, Wolff wrote a great part of his works in his mother tongue, while Leibnitz for the most part wrote only in Latin or French. This is an important matter, for, as we have already noticed (pp. 114 and 150), it is only when a nation possesses a science in its own language that it can really be said to belong to it; and in Philosophy most of all this is requisite. For thought has in it this very moment of pertaining to self-consciousness or of being absolutely its own; when one's own language is the vehicle of expression, as when we talk of "Bestimmtheit" instead of "Determination," and "Wesen" instead of "Essenz," it is immediately present to our consciousness that the conceptions are absolutely its own; it has to deal with these at all times, and they are in no way foreign to it. The Latin language has a phraseology, a definite sphere and range of conception; it is at once taken for granted that when men write in Latin they are at liberty to be dull; it is impossible to read or write what men permit

themselves to say in Latin. The titles of Wolff's philosophic works are perpetually of this nature: "Rational thoughts on the powers of the human understanding and their right uses in the knowledge of the truth," Halle, 1712, 8vo; "Rational thoughts on God, the world, and the soul of man, likewise on all things generally," Frankfort and Leipzig, 1719; "On the action and conduct of men," Halle, 1720; "On Social Life," Halle, 1720; "On the operations of Nature," Halle, 1723, and so on. Wolff wrote German and Latin quartos on every department of Philosophy, even on economics — twenty-three thick volumes of Latin, or about forty quartos altogether. His mathematical works make a good many more quartos. He brought into general use the differential and integral calculus of Leibnitz.

It is only in its general content and taken as a whole that Wolff's philosophy is the philosophy of Leibnitz, that is to say, only in relation to the fundamental determinations of monads and to the theodicy — to these he remained faithful; any other content is empiric, derived from our feelings and desires. Wolff likewise accepted in their entirety all the Cartesian and other definitions of general ideas. Hence we find in him abstract propositions and their proofs mingled with experiences, on the indubitable truth of which he builds a large part of his propositions; and he must so build and derive his foundations if a content is to result at all. With Spinoza, on the contrary, no content is to be found excepting absolute substance and a perpetual return into the same. The greatness of Wolff's services to the culture of Germany, which now appeared quite independently and without any connection with an earlier and profounder metaphysical standpoint (*supra*, p. 350), are in proportion to the barrenness and inward contentless condition into which Philosophy had sunk. This he divided into its formal disciplines, spinning it out into determinations of the understanding with a pedantic application of geometric methods; and, contemporaneously with the English philosophers, he made the dogmatism of the metaphysics of the

understanding fashionable, that is a philosophizing which determines the absolute and rational by means of self-exclusive thought-determinations and relationships (such as one and many, simple and compound, finite and infinite, causal connection, &c.). Wolff entirely displaced the Aristotelian philosophy of the schools, and made Philosophy into an ordinary science pertaining to the German nation. But besides this he gave Philosophy that systematic and requisite division into sections which has down to the present day served as a sort of standard.

In theoretic philosophy Wolff first treats of Logic purified from scholastic interpretations or deductions; it is the logic of the understanding which he has systematized. The second stage is Metaphysics, which contains four parts: first there is Ontology, the treatment of abstract and quite general philosophic categories, such as Being (ὄν) and its being the One and Good; in this abstract metaphysic there further comes accident, substance, cause and effect, the phenomenon, &c. Next in order is Cosmology, a general doctrine of body, the doctrine of the world; here we have abstract metaphysical propositions respecting the world, that there is no chance, no leaps or bounds in nature — the law of continuity. Wolff excludes natural science and natural history. The third part of the metaphysic is rational psychology or pneumatology, the philosophy of the soul, which deals with the simplicity, immortality, immateriality of the soul. Finally, the fourth is natural theology, which sets forth the proofs of the existence of God.[277] Wolff also inserts (chap. iii.) an empirical psychology. Practical philosophy he divides into the Rights of Nature, Morality, the Rights of Nations or Politics, and Economics.

The whole is propounded in geometric forms such as definitions, axioms, theorems, scholia, corollaries, &c. In mathematics the understanding is in its proper place, for the triangle must remain the triangle. Wolff on the one hand started upon a large range of investigation,

and one quite indefinite in character, and on the other, held to a strictly methodical manner with regard to propositions and their proofs. The method is really similar to that of Spinoza, only it is more wooden and lifeless than his. Wolff applied the same methods to every sort of content — even to that which is altogether empirical, such as his so-called applied mathematics, into which he introduces many useful arts, bringing the most ordinary reflections and directions into the geometric form. In many cases this undoubtedly gives his work a most pedantic aspect, especially when the content directly justifies itself to our conception without this form at all. For Wolff proceeds by first laying down certain definitions, which really rest upon our ordinary conceptions, since these he translated into the empty form of determinations of the understanding. Hence the definitions are merely nominal definitions, and we know whether they are correct only by seeing whether they correspond to conceptions which are referred to their simple thoughts. The syllogism is the form of real importance in this mode of reasoning, and with Wolff it often attains to its extreme of rigidity and formalism.

Under mathematics, which is the subject of four small volumes, Wolff also treats of architecture and military science. One of the propositions in Architecture is this: "Windows must be wide enough for two persons." The making of a door is also propounded as a task, and the solution thereof given. The next best example comes from the art of warfare. The "Fourth proposition. The approach to the fortress must always be harder for the enemy the nearer he comes to it." Instead of saying, because the danger is greater, which would be trivial, there follows the "Proof. The nearer the enemy comes to the fortress, the greater the danger. But the greater the danger the greater the resistance that must be offered in order to defy the attacks, and, so far as may be, avert the danger. Hence the nearer the enemy is to the fort the harder must the approach be made for him. Q.E.D."[278]

Since the increase of the danger is given as the reason, the whole is false, and the contrary may be said with equal truth. For if at the beginning all possible resistance is offered to the enemy, he cannot get nearer the fortress at all, and thus the danger cannot become greater. The greater resistance has a real cause, and not this foolish one — namely, that because the garrison is now at closer quarters, and consequently operates in a narrow field, it can offer a greater resistance. In this most trivial way Wolff proceeds with every sort of content. This barbarism of pedantry, or this pedantry of barbarism, represented as it is in its whole breadth and extent, necessarily brought itself into disrepute; and without there being a definite consciousness of the reason why the geometric method is not the only and ultimate method of knowledge, instinct and an immediate consciousness of the foolishness of its applications caused this method to be set aside.

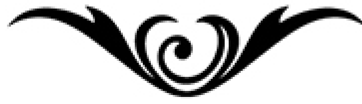
3. The Popular Philosophy of Germany.

Popular philosophy flatters our ordinary consciousness, makes it the ultimate standard. Although with Spinoza we begin with presupposed definitions, the content is still profoundly speculative in nature, and it is not derived from the ordinary consciousness. In Spinoza thinking is not merely the form, for the content belongs to thinking itself; it is the content of thought in itself. In the speculative content the instinct of reason satisfies itself on its own account, because this content, as a totality which integrates itself within itself, at once in itself justifies itself to thought. The content in Spinoza is only without ground in so far as it has no external ground, but is a ground in itself. But if the content is finite, a demand for an external ground is indicated, since in such a case we desire to have a ground other than this finite. In its matter the philosophy of Wolff is indeed a popular philosophy, even if in form it still makes thought authoritative. Until the time of Kant the philosophy of Wolff was thus pre-eminent. Baumgarten,

Crusius, and Moses Mendelssohn worked each of them independently on the same lines as Wolff; the philosophy of the last-mentioned was popular and graceful in form. The Wolffian philosophy was thus carried on, although it had cast off its pedantic methods: no further progress was however made. The question dealt with was how perfection could be attained — what it is possible to think and what not; metaphysic was reduced to its slightest consistency and to its completest vacuity, so that in its texture not a single thread remained secure. Mendelssohn considered himself, and was considered, the greatest of philosophers, and was lauded as such by his friends. In his "Morgenstunden" we really find a dry Wolffian philosophy, however much these gentlemen endeavoured to give their dull abstractions a bright Platonic form.

The forms of Philosophy which we have considered bear the character which pertains specially to metaphysics, of proceeding from general determinations of the understanding, but of combining therewith experience and observation, or the empiric method in general. One side of this metaphysic is that the opposites of thought are brought into consciousness, and that attention is directed upon the solution of this contradiction. Thought and Being or extension, God and the world, good and evil, the power and prescience of God on the one side, and the evil in the world and human freedom on the other: these contradictions, the opposites of soul and spirit, things conceived and things material, and their mutual relation, have occupied all men's attention. The solution of these opposites and contradictions has still to be given, and God is set forth as the One in whom all these contradictions are solved. This is what is common to all these philosophies as far as their main elements are concerned. Yet we must likewise remark that these contradictions are not solved in themselves, *i.e.* that the nullity of the supposition is not demonstrated in itself, and thereby a true concrete solution has not come to pass. Even if God is recognized as

solving all contradictions, God as the solution of these contradictions is a matter of words rather than something conceived and comprehended. If God is comprehended in His qualities, and prescience, omnipresence, omniscience, power, wisdom, goodness justice, &c., are considered as qualities of God Himself, they simply lead to contradictions; and these contradictions, Leibnitz (*supra*, p. 348) sought to remove by saying that the qualities temper one another, *i.e.* that they are combined in such a way that one annuls the other. This, however, is no real comprehension of such contradiction.



This metaphysic contrasts greatly with the old philosophy of a Plato or an Aristotle. To the old philosophy we can always turn again and admit its truth; it is satisfying in the stage of development it has reached — a concrete centre-point which meets all the problems set by thought as these are comprehended. In this modern metaphysic, however, the opposites are merely developed into absolute contradictions. God is indeed given as their absolute solution, but only as an abstract solution, as a Beyond; on this side all contradictions are, as regards their content, unsolved and unexplained. God is not comprehended as the One in whom these contradictions are eternally resolved; He is not comprehended as Spirit, as the Trinity. It is in Him alone as Spirit, and as Spirit which is Three in One, that this opposition of Himself and His Other, the Son, is contained, and with it the resolution of the same; this concrete Idea of God as reason, has not as yet found an entrance into Philosophy.

In order that we may now cast a retrospective glance over the philosophic efforts of other nations, we shall apply ourselves to the further progress of Philosophy. Once more we see Scepticism making its way into this arid philosophy of the understanding. But this time it is, properly speaking, in the form of Idealism, or the determinations are subjective determinations of self-consciousness. In the place of thought we

consequently find the Notion now making its appearance. Just as with the Stoics determinateness is held to be an object of thought, we have in modern times this same manifestation of thought as the unmoved form of simplicity. Only here the image or inner consciousness of totality is present, the absolute spirit which the world has before it as its truth and to whose Notion it makes its way — this is another inward principle, another implicitude of mind which it endeavours to bring forth from itself and for itself, so that reason is a comprehension of the same, or has the certitude of being all reality. With the ancients reason (λόγος), as the implicit and explicit Being of consciousness, had only an ethereal and formal existence as language, but here it has certainty as existent substance. Hence with Descartes there is the unity of the Notion and Being, and with Spinoza the universal reality. The first commencement of the Notion of the movement of fixed thoughts in themselves is found in this, that the movement which, as method, simply falls outside its object, comes within it, or that self-consciousness comes within thought. Thought is implicitude without explicitude, an objective mode bearing no resemblance to a sensuous thing; and yet it is quite different from the actuality of self-consciousness. This Notion which we now find entering into thought, has the three kinds of form which we still have to consider; in the first place it has that of individual self-consciousness or the formal conception generally; secondly, that of universal self-consciousness, which applies itself to all objects whether they be objects of thought, determinate conceptions, or have the form of actuality — that is to say it applies itself to what is established in thought, to the intellectual world with the riches of its determinations and looked on as a Beyond, or to the intellectual world in as far as it is its realization, the world here and around us. It is in those two ways, and in those ways alone, that the actual Notion is present in the succeeding chapter; for not as yet is it in the third place to be found as taken back into

thought, or as the self-thinking or thought-of Notion. While that universal self-consciousness is, on the whole, a thought which grasps and comprehends, this third kind of thought is the Notion itself recognized as constituting reality in its essence, that is to say as Idealism. These three aspects again divide themselves as before into the three nations which alone count in the civilized world. The empirical and perfectly finite form of Notion pertains to the English; to the French belongs its form as making an attempt at everything, as establishing itself in its reality, abolishing all determination, and therefore being universal, unlimited, pure self-consciousness; and, lastly, to the German pertains the entering into itself of this implicitude, the thought of the absolute Notion.

CHAPTER II. Transition Period

THE DECADENCE WHICH we find in thought until the philosophy of Kant is reached, is manifested in what was at this time advocated in opposition to the metaphysic of the understanding, and which may be called a general popular philosophy, a reflecting empiricism, which to a greater or less extent becomes itself a metaphysic; just as, on the other hand, that metaphysic, in as far as it extended to particular sciences, becomes empiricism. As against these metaphysical contradictions, as against the artificialities of the metaphysical synthesis, as against the assistance of God, the pre-established harmony, the best possible world, &c., as against this merely artificial understanding, we now find that fixed principles, immanent in mind, have been asserted or maintained respecting what is felt, intuitively perceived and honoured in the cultured human breast. And in distinction to the assertion that we only find the solution in the Beyond, in God, these concrete principles of a fixed and permanent content form a reconciliation here and now, they adopt a position of independence, and assume an intellectual standing-ground which they find in what has generally been termed the healthy human understanding. Such determinations may indeed be found to be perfectly good and valid if the feelings, intuitions, heart and understanding of man be morally and intellectually fashioned; for in that case better and more noble feelings and desires may rule in men and a more universal content may be expressed in these principles. But when men make what we call sound reason — that which is by nature implanted in man's breast — into the content and the principle, the healthy human understanding discovers itself to be identical with a feeling and knowledge belonging to nature. The Indians who worship

a cow, and who expose or slay new-born children, and commit all sorts of barbarous deeds, the Egyptians who pray to a bird, the apis, &c., and the Turks as well, all possess a healthy human understanding similar in nature. But the healthy human understanding and the natural feeling of rude and barbarous Turks, when taken as a standard, result in shocking principles. When we speak of healthy human understanding, however, of natural feelings, we always have before our eyes a cultured mind; and those who make the healthy human reason, the natural knowledge, the immediate feelings and inspirations found in themselves, into a rule and standard, do not know that when religion, morality, and rectitude are discovered to be present in the human breast, this is due to culture and education, which are the first to make such principles into natural feelings. Here natural feelings and the healthy human understanding are thus made the principle; and much may be recognized as coming under these heads. This then is the form taken by Philosophy in the eighteenth century. Taken as a whole, three points of view have to be considered; in the first place, Hume must be regarded on his own account, then the Scottish, and, thirdly, the French philosophy. Hume is a sceptic; the Scottish philosophy opposes the scepticism of Hume, the French philosophy has in the "enlightenment" of Germany (by which expression is indicated that form of German philosophy which is not Wolffian metaphysics) an appendage of a feebler form. Since from the metaphysical God we can make no further progress in the concrete, Locke grounds his content on experience. But that empiricism leads thought to no fixed standpoint, Hume demonstrates by denying every universal; the Scottish philosophers, on the contrary, undoubtedly maintain universal propositions and truths, but not through thought. Hence in empiricism itself the fixed standpoint has now to be adopted; thus the French find the universal in the actuality which they call *réalité*. They do not, however, find its content in and from thought, but as living substance, as nature and

matter. All this is a further working out of reflecting empiricism, and some more details respecting it must still be given.

A. Idealism and Scepticism.

THOUGHT GENERALLY IS simple, universal self-identity, but in the form of negative movement, whereby the determinate abrogates itself. This movement of Being-for-self is now an essential moment of thought, while hitherto it was outside it; and thus grasping itself as movement in itself, thought is self-consciousness — at first indeed formal, as individual self-consciousness. Such a form it has in scepticism, but this distinction marks it off from the older scepticism, that now the certainty of reality is made the starting point. With the ancients, on the contrary, scepticism is the return into individual consciousness in such a way that to it this consciousness is not the truth, in other words that scepticism does not give expression to the results arrived at, and attains no positive significance. But since in the modern world this absolute substantiality, this unity of implicitude and self-consciousness is fundamental — that is, this faith in reality generally — scepticism has here the form of idealism, *i.e.* of expressing self-consciousness or certainty of self as all reality and truth. The crudest form of this idealism is when self-consciousness, as individual or formal, does not proceed further than to say: All objects are our conceptions. We find this subjective idealism in Berkeley,[279] and another form of the same in Hume.

1. Berkeley.

This idealism, in which all external reality disappears, has before it the standpoint of Locke, and it proceeds directly from him. For we saw that to Locke the source of truth is experience, or Being as perceived. Now since

this sensuous Being, as Being, has in it the quality of being for consciousness, we saw that it necessarily came to pass that in Locke's case some qualities, at least, were so determined that they were not in themselves, but only for another; and that colour, figure, &c., had their ground only in the subject, in his particular organization. This Being-for-another, however, was not by him accepted as the Notion, but as falling within self-consciousness — i.e. self-consciousness not looked on as universal, — not within mind, but within what is opposed to the implicit.

George Berkeley was born in 1684 at Kilcrin, near Thomastown, in the county of Kilkenny, Ireland: in 1754 he died as an English Bishop.[280] He wrote the "Theory of Vision," 1709; "A Treatise concerning the principles of human knowledge," 1710; "Three Dialogues between Hylas and Philonous," 1713. In 1784 his collected works were published in London in two quarto volumes.

Berkeley advocated an idealism which came very near to that of Malebranche. As against the metaphysic of the understanding, we have the point of view that all existence and its determinations arise from feeling, and are constituted by self-consciousness. Berkeley's first and fundamental thought is consequently this: "The Being of whatever is called by us a thing consists alone in its being perceived," *i.e.* our determinations are the objects of our knowledge. "All objects of human knowledge are ideas" (so called by Berkeley as by Locke), "which arise either from the impressions of the outward senses, or from perceptions of the inward states and activities of the mind, or finally, they are such as are constituted by means of memory and imagination through their separation and rearrangement. A union of different sensuous feelings appears to us to be a particular thing, *e.g.* the feeling of colour, taste, smell, figure, &c.; for by colours, smells, sounds, something of which we have a sensation is always understood."[281] This is the matter and the object of knowledge; the knower is the percipient "I,"

which reveals itself in relation to those feelings in various activities, such as imagination, remembrance, and will.

Berkeley thus indeed acknowledges the distinction between Being-for-self and Other-Being, which in his case, however, itself falls within the "I." Of the matter on which activity is directed, it is no doubt in regard to one portion allowed that it does not exist outside of mind — that is to say, so far as our thoughts, inward feelings and states, or the operations of our imaginary powers are concerned. But in like manner the manifold sensuous conceptions and feelings can only exist in a mind. Locke certainly distinguished extension and movement, for example, as fundamental qualities, *i.e.* as qualities which pertain to the objects in themselves. But Berkeley very pertinently points out inconsistency here from the point of view that great and small, quick and slow, hold good as something relative; thus were extension and movement to be inherent or implicit, they could not be either large or small, quick or slow; that is, they could not be, for these determinations rest in the conception[282] of such qualities. In Berkeley the relation of things to consciousness is alone dealt with, and beyond this relationship they do not in his view come. From this it follows that it is only self-consciousness that possesses them; for a perception which is not in a conceiving mind is nothing: it is a direct contradiction. There can be no substance, he says, which neither conceives nor perceives, and which is yet the substratum of perceptions and conceptions. If it is represented that there is something outside of consciousness which is similar to the conceptions, this is likewise contradictory; a conception can alone be similar to a conception, the idea to the idea alone.[283]

Thus, while Locke's ultimate point is abstract substance, Being generally with the real determination of a substratum of accidents, Berkeley declares this substance to be the most incomprehensible assumption of all; but the incomprehensibility does not make this Being into an absolute nullity, nor

does it make it in itself incomprehensible.[284] For Berkeley brings forward against the present existence of external objects only the inconceivability of the relation of a Being to mind. This inconceivability, however, is destroyed in the Notion, for the Notion is the negative of things; and this moved Berkeley and Leibnitz to shut up the two sides in themselves. There nevertheless remains a relationship of what is "other" to us; these feelings do not develop from us as Leibnitz represents, but are determined through somewhat else. When Leibnitz speaks of development within the monads, it is nothing but empty talk; for the monads as they follow in succession have no inward connection. Each individual is thus determined through another, and not through us; and it does not matter what this external is, since it remains a contingent. Now in relation to the two sides of Leibnitz which are indifferent to one another, Berkeley says that such an "other" is quite superfluous. Berkeley calls the other the objects; but these, he says, cannot be what we call matter, for spirit and matter cannot come together.[285] But the necessity of conceptions directly contradicts this Being-within-self of the conceiver; for the Being-within-self is the freedom of the conceiver; the latter does not, however, produce the conceptions with freedom; they have for him the form and determinateness of an independent "other." Berkeley likewise does not accept idealism in the subjective sense, but only in respect that there are spirits which impart themselves (in the other case the subject forms his own conceptions), and consequently that it is God alone who brings to pass such conceptions; thus the imaginations or conceptions which are produced by us with our individual activity remain separate from these others,[286] *i.e.* from the implicit.

This conception gives an instance of the difficulties which appear in regard to these questions, and which Berkeley wished to escape from in a quite original way. The inconsistency in this system God has again to make good; He has to bear it all away; to Him the solution of the contradiction is

left. In this idealism, in short, the common sensuous view of the universe and the separation of actuality, as also the system of thought, of judgments devoid of Notion, remain exactly as before; plainly nothing in the content is altered but the abstract form that all things are perceptions only.[287] Such idealism deals with the opposition between consciousness and its object merely, and leaves the extension of the conceptions and the antagonisms of the empirical and manifold content quite untouched; and if we ask what then is the truth of these perceptions and conceptions, as we asked formerly of things, no answer is forthcoming. It is pretty much a matter of indifference whether we believe in things or in perceptions, if self-consciousness remains possessed entirely by finalities; it receives the content in the ordinary way, and that content is of the ordinary kind. In its individuality it stumbles about amid the conceptions of an entirely empirical existence, without knowing and understanding anything else about the content: that is to say in this formal idealism reason has no content of its own.

As to what Berkeley further states in respect of the empirical content, where the object of his investigation becomes entirely psychological, it relates in the main to finding out the difference between the sensations of sight and feeling, and to discovering which kind of sensations belong to the one and which to the other. This kind of investigation keeps entirely to the phenomenal, and only therein distinguishes the various sorts of phenomena; or comprehension only reaches as far as to distinctions. The only point of interest is that these investigations have in their course chiefly lighted on space, and a dispute is carried on as to whether we obtain the conception of distance and so on, in short all the conceptions relating to space, through sight or feeling. Space is just this sensuous universal, the universal in individuality itself, which in the empirical consideration of empirical multiplicity invites and leads us on to thought (for it itself is thought), and

by it this very sensuous perception and reasoning respecting perception is in its action confused. And since here perception finds an objective thought, it really would be led on to thought or to the possession of a thought, but at the same time it cannot arrive at thought in its completion, since thought or the Notion are not in question, and it clearly cannot come to the consciousness of true reality. Nothing is thought in the form of thought, but only as an external, as something foreign to thought.

2. Hume.

We must add to what has preceded an account of the Scepticism of Hume, which has been given a more important place in history than it deserves from its intrinsic nature; its historic importance is due to the fact that Kant really derives the starting point of his philosophy from Hume.

David Hume was born in 1711 at Edinburgh and died there in 1776. He held a librarian's post in that town for some time, then he became secretary to the Embassy in Paris; for quite a long period, indeed, he moved in diplomatic circles. In Paris he came to know Jean Jacques Rousseau and invited him to England, but Rousseau's terribly distrustful and suspicious nature very soon estranged the two.[288] Hume is more celebrated as a writer of history than through his philosophic works. He wrote: "A Treatise of human nature," 3 vols., 1739, translated into German by Jacob, Halle, 1790, 8vo; likewise "Essays and Treatises on several subjects," 2 vols. (Vol. I. containing "Essays moral, political and literary," printed for the first time in Edinburgh, 1742; Vol. II. containing an "Inquiry concerning human understanding," a further development of the Treatise, and first printed separately in London, 1748, 8vo). In his "Essays," which contributed most to his fame as far as the philosophic side is concerned, he treated philosophic subjects as an educated, thoughtful man of the world would do — not in a systematic connection, nor showing the wide range which his

thoughts should properly have been able to attain; in fact in some of his treatises he merely dealt with particular points of view.

We must shortly deal with the main aspects of Hume's philosophy. He starts directly from the philosophic standpoint of Locke and Bacon, which derives our conceptions from experience, and his scepticism has the idealism of Berkeley as its object. The sequence of thought is this: Berkeley allows all ideas to hold good as they are; in Hume the antithesis of the sensuous and universal has cleared and more sharply defined itself, sense being pronounced by him to be devoid of universality. Berkeley does not make any distinction as to whether in his sensations there is a necessary connection or not. Formerly experience was a mixture of the two elements. Hume tells us that all perceptions of the mind may be divided into two classes or species, that of impressions, *i.e.* sensuous perceptions, and thoughts or ideas; the latter are similar in content to the former, but less forcible and lively. All objects of reason are consequently either relations of thoughts such as mathematical axioms, or facts of experience.[289] Since Hume makes these into the content he naturally rejects innate ideas.[290]

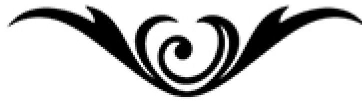
Now when Hume goes on to consider more closely what is subsumed under experience, he finds categories of the understanding present there, and more especially the determination of the universal and of universal necessity; he took under his consideration more particularly the category of cause and effect, and in it set forth the rational element, inasmuch as in this causal relationship necessity is especially contained. Here Hume really completed the system of Locke, since he consistently drew attention to the fact that if this point of view be adhered to, experience is indeed the principle of whatever one knows, or perception itself contains everything that happens, but nevertheless the determination of universality and necessity are not contained in, nor were they given us by experience. Hume has thus destroyed the objectivity or absolute nature of thought-

determinations. “Our conviction of the truth of a fact rests on feeling, memory, and the reasonings founded on the causal connection, *i.e.* on the relation of cause and effect. The knowledge of this relation is not attained by reasonings *a priori*, but arises entirely from experience; and we draw inferences, since we expect similar results to follow from similar causes, by reason of the principle of the custom or habit of conjoining different manifestations, *i.e.* by reason of the principle of the association of ideas. Hence there is no knowledge and no metaphysics beyond experience.”[291]

The simple thought we have here is exactly what Locke says, that we must receive the conception of cause and effect, and thus of a necessary connection, from experience; but experience, as sensuous perception, contains no necessity, has no causal connection. For in what we term such, that which we properly speaking perceive is merely the fact that something first of all happens and that then something else follows. Immediate perception relates only to a content of conditions or things which are present alongside of and in succession to one another, but not to what we call cause and effect; in time-succession there is thus no relation of cause and effect, and consequently no necessity either.[292] When we say the pressure of the water is the cause of the destruction of this house, that is no pure experience. We have merely seen the water pressing or moving along in this direction, and subsequently the house falling down; and so with other examples. Necessity is thus not justified by experience, but we carry it into experience; it is accidentally arrived at by us and is subjective merely. This kind of universality which we connect with necessity, Hume calls custom. Because we have often seen results to follow we are accustomed to regard the connection as a necessary one; the necessity to him is thus a quite contingent association of ideas, which is custom.

It is the same thing in respect of the universal. What we perceive are individual phenomena and sensations in which we see that this is now one

thing and now another. It may likewise be that we perceive the same determination frequently repeated and in manifold ways. But this is still far removed from universality; universality is a determination which is not given to us through experience. It may be said that this is quite a correct remark on Hume's part, if by experience we understand outward experience. Experience is sensible that something exists, but nevertheless the universal is not as yet present in it. Indeed, sensuous existence as such is something which is set forth as indifferent, not differentiated from anything else; but sensuous existence is likewise universal in itself, or the indifference of its determinateness is not its only determinateness. But since Hume regards necessity, the unity of opposites, as resting quite subjectively on custom, we cannot get any deeper in thought. Custom is indeed so far a necessity in consciousness, and to this extent we really see the principle of this idealism in it; but in the second place this necessity is represented as something quite devoid of thought or Notion.



This custom obtains both in our perception which relates to sensuous nature, and in relation to law and morality. The ideas of justice and morality rest upon an instinct, on a subjective, but very often deceptive moral feeling.[293] From a sceptical point of view the opposite may likewise be demonstrated. From this side Hume considers justice, morality, religious determinations, and disputes their absolute validity. That is to say when it is assumed that our knowledge arises from experience, and that we must consider only what we obtain thereby to be the truth, we find indeed in our feeling, the sentiment *e.g.* that the murderer, the thief, &c., must be punished; and because this is likewise felt by others it is universally allowed. But Hume, like the sceptics of former days, appeals to the various opinions of various nations: amongst different nations and in different times various standards of right have been held.[294] There are those who in this case do not have the feeling of wrong-doing in respect of stealing, *e.g.* the

Lacedæmonians or the so-called innocent inhabitants of the South Sea Islands. What is by one nation called immoral, shameful and irreligious, is by another not considered so at all. Thus because such matters rest upon experience, one subject has such and such an experience, finds, for instance, in his religious feelings this determination which inclines him to God, while another subject has different experiences altogether. We are in the habit of allowing one thing to be just and moral, others have another mode of regarding it. Hence if the truth depends upon experience, the element of universality, of objectivity, &c., comes from elsewhere, or is not justified by experience. Hume thus declared this sort of universality, as he declared necessity, to be rather subjectively than objectively existent; for custom is just a subjective universality of this kind. This is an important and acute observation in relation to experience looked at as the source of knowledge; and it is from this point that the Kantian reflection now begins.

Hume (Essays and Treatises on several subjects, Vol. III. Sect. 8, 11) then extended his scepticism to the conceptions and doctrines of freedom and necessity, and to the proofs of the existence of God; and in fact scepticism here possesses a wide field. To such a system of reasoning from thoughts and possibilities another method of reasoning may again be opposed, and this reasoning is no better than the other. What is said to be metaphysically established regarding immortality, God, nature, &c., lacks a real ground for resting upon, such as is professed to be given; for the inferences on which men ground their proofs are subjectively formed conceptions. But where a universality is found, it does not rest in the matter in itself, but is simply a subjective necessity which is really mere custom. Hence the result which Hume arrives at is necessarily astonishment regarding the condition of human knowledge, a general state of mistrust, and a sceptical indecision — which indeed does not amount to much. The condition of human knowledge regarding which Hume so much wonders,

he further describes as containing an antagonism between reason and instinct; this instinct, it is said, which embraces many sorts of powers, inclinations, &c., deceives us in many different ways, and reason demonstrates this. But on the other side it is empty, without content or principles of its own; and if a content is in question at all, it must keep to those inclinations. In itself reason thus has no criterion whereby the antagonism between individual desires, and between itself and the desires, may be settled.[295] Thus everything appears in the form of an irrational existence devoid of thought; the implicitly true and right is not in thought, but in the form of an instinct, a desire.

B. Scottish Philosophy.

IN SCOTLAND QUITE another school of thought developed, and the Scotch are the foremost of Hume's opponents; in German philosophy, on the other hand, we have to recognize in Kant another opposing force to that of Hume. To the Scottish school many philosophers belong; English philosophy is now restricted to Edinburgh and Glasgow, in which places a number of professors belonging to this school succeeded one another. To the scepticism of Hume they oppose an inward independent source of truth for all that pertains to religion and morality. This coincides with Kant, who also maintains an inward source or spring as against external perception; but in the case of Kant this has quite another form than that which it possesses with the Scottish philosophers. To them this inward independent source is not thought or reason as such, for the content which comes to pass from this inwardness is concrete in its nature, and likewise demands for itself the external matter of experience. It consists of popular principles, which on the one hand are opposed to the externality of the sources of knowledge, and, on the other, to metaphysics as such, to abstract thought or reasoning on its own account. This sort of reasoning understanding applied itself to ethics and to politics — sciences which have been much developed by German, French, and above all by Scottish philosophers (*supra*, p. 320): they regarded morality as cultured men would, and sought to bring moral duties under a principle. Many of their works are translated into German; several of these on ethics or morality are translated by Garve, for instance, who also translated Cicero *De Officiis*, and they are written in a manner similar to that of Cicero when he uses the expression *Insitum est a natura* (Vol. I. p. 93). This moral sentiment and the ordinary human understanding

hereafter formed the common principle to a whole succession of Scots, such as Thomas Reid, Beattie, Oswald, and others; in this way they frequently made sagacious observations, but with them speculative philosophy quite disappears. One special characteristic of these Scottish philosophers is that they have sought accurately to define the principle of knowledge; but on the whole they start from the same point as that which was in Germany likewise accepted as the principle. That is to say they represented the so-called healthy reason, or common-sense (*sensus communis*), as the ground of truth. The following are the principal members of this school, each of whom has some special feature distinguishing him from the rest.

1. Thomas Reid.

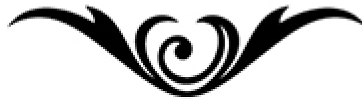
Thomas Reid, born in 1710, died as a professor in Glasgow in 1796.[296] He maintained the principle of common-sense. His endeavour was to discover the principles of knowledge, and the following are his conclusions: "(a) There are certain undemonstrated and undemonstrable fundamental truths which common-sense begets and recognizes as immediately conclusive and absolute." This hence constitutes an immediate knowledge; in it an inward independent source is set forth which is hereby opposed to religion as revealed. "(b) These immediate truths require no support from any elaborated science, nor do they submit to its criticism;" they cannot be criticized by philosophy. "(c) Philosophy itself has no root other than that of an immediate, self-enlightening truth; whatever contradicts such truth is in itself false, contradictory, and absurd." This is true for knowledge and "(d) Morality; the individual is moral if he acts in accordance with the perfect principles of the perfection of the whole and with his own duty as it is known to him."[297]

2. James Beattie.

James Beattie, born 1735, was a professor of moral philosophy in Edinburgh and Aberdeen, and died in 1803. He likewise made common-sense the source of all knowledge. “The common-sense of the plain human understanding is the source of all morality, of all religion, and all certainty. The confirmation of common-sense must be added to the testimony of our senses. The truth is what the necessities of my nature call upon me to believe. Belief signifies conviction in the case of truths which are certain, in that of those which are probable, approbation. The truth which is certain is known by means of intuition, the probable truth by means of proofs.”[298] Such convictions as are quite certain form the basis of actions.

3. James Oswald.

James Oswald, a Scottish clergyman, made use of an expression which indicates that we have the principles just mentioned as facts existing within us.[299] “The existence of the Divine Being is (according to him) a fact absolutely raised above all reasoning and all doubt, and immediately certain for the common-sense of morality.”[300] The same principle was likewise established in Germany at this time — an inward revelation, a knowledge of the conscience, and specially of God and His Being.



4. Dugald Stewart.

To this school also belong Dugald Stewart, Edward Search,[301] Ferguson, and Hutcheson, most of whom have written on morals. The political economist Adam Smith from this point of view is likewise a philosopher, and the best known of them all. This Scottish philosophy is now given forth in Germany as something new. It is a popular philosophy, which, on the one hand, has the great merit of seeking in man, and in his consciousness, for the source of all that should be held by him as true, the immanence of what should be by him esteemed. The content is at the same time a concrete content; in a

certain degree, it is the antithesis of metaphysics proper, of the wandering about in abstract determinations of the understanding. Of these Scots, Dugald Stewart, who is living still,[302] appears to be the last and least significant; in them all there is the same ground-work to be found, the same circle of reflection, namely, an *a priori* philosophy, though not one which is to be pursued in a speculative way. The general idea which pervades their principle is that of the healthy human understanding; to this they have added benevolent desires, sympathy, a moral sense, and from such grounds composed very excellent moral writings. That is certainly all very well in order to understand approximately, up to a certain degree of culture, what universal thoughts are, in order to narrate their history, to appeal to examples, and to explain them; but further it does not extend.

In more recent times this Scottish philosophy has passed to France, and Professor Royer-Collard, now president of the Second Chamber,[303] as also his disciple, Jouffroy, in conformity with it, pass from the facts of consciousness through cultured reasoning and experience, to a further stage in development. What by the French is called *Idéologie* (*supra*, p. 308) has also its place here; it is abstract metaphysics, in so far as it is an enumeration and analysis of the most simple thought-determinations. They are not treated dialectically, but from our reflection, from our thoughts, the material is derived, and in this the determinations therein contained are demonstrated.

C. French Philosophy.

WE PASS ON to the French philosophy; the relation it bears to metaphysics is this, that while man as a metaphysician stands to himself in the attitude of a layman or outsider, French philosophy does away with the lay or outside position in regard alike to politics, religion, and philosophy. Two forms have to be mentioned which are of the greatest importance in respect to culture — French philosophy and the *Aufklärung*. With the English we saw a certain idealism only: this was either formal, as the mere general translation of Being into Being-for-another, *i.e.* into perceptibility, or else what is implicit in this perceptibility, instincts, impulses, habits, &c. — blind determinate forces; a return into self-consciousness, which itself appears as a physical thing. In that first idealism the whole finitude and extension of appearances, of sensations, and likewise of thoughts and determinate fixed conceptions, remain just what they are in the unphilosophic consciousness. The scepticism of Hume makes all that is universal sink into habits and instincts, *i.e.* it consists in a more simple synthesis of the phenomenal world; but these simpler elements, these instincts, impulses, and forces, are just as much a fixed present existence in self-consciousness, unspiritual, and without movement. The French philosophy has more life, more movement, more spirit; it would perhaps be more correct to describe it as full of life and spirit. It is the absolute Notion, which revolts against the whole reigning system of prevalent conceptions and established ideas, which overthrows all that has settled into fixity, and acquires the consciousness of perfect liberty. At the root of this idealistic activity lies the certainty that whatever is, whatever counts for anything in itself, is all a matter of self-consciousness; and as to Notions (individual and

isolated existences ruling actual self-consciousness), such as the Notions of good and evil, of power and riches, and the fixed conceptions regarding faith in God and His relation to the world, His mode of government and, further, the duties of self-consciousness towards Him — that all these are not truths in themselves, having validity beyond the bounds of self-consciousness. All these forms, the real implicitude of the actual world and also of the supersensuous world, are therefore set aside in this spirit conscious of itself. It does not trouble itself seriously about those who admit the validity of these conceptions just as they are, and accept them as true, respecting them as independent and free apart from self-consciousness, but it speaks of such conceptions with intelligence and spirit, that is to say, it asserts that self-consciousness by its activity is the first to make anything of them, and to make that a something very different from what they profess to be; for the self-conscious spirit only intellectual relations, these processes of formation and movement by means of its self-consciousness, possess validity and interest. This is the character of the Notion in its actuality; what has reality for this all-perceiving and all-comprehending consciousness is held to be valid.

We must now consider what form existence takes for this absolutely comprehending self-consciousness. In the first place this Notion is fixed as the negative movement of the Notion only; the positive and simple, or existence, falls outside of this movement. There remains to the Notion no distinction, no content; for all determinate content is lost in that negativity. This empty existence is for us pure thought generally, what the French call *être suprême*, or if represented objectively as existent, and as in opposition to consciousness, it is matter. Absolute Being is therefore determined as matter, as empty objectivity, through a Notion which destroys all content and determination, and has as its object this universal alone. It is a Notion which acts only destructively, and does not again construct itself out of this

matter or pure thought or pure substantiality. We here see so-called materialism and atheism freely emerge, as the necessary result of the pure comprehending self-consciousness. From one point of view there perishes in this negative movement all determination which represents spirit as something beyond self-consciousness, and more especially all determinations within the spirit, and also those which express it as spirit, indeed all the conceptions formed of it by faith, for which it has validity as an existent self-consciousness beyond self-consciousness — in short, all that is traditional or imposed by authority. There remains only a present, actual Being, for self-consciousness recognizes implicit existence only in the form which it has for self-consciousness, and in which it is actually known to itself; in matter, and matter as actively extending and realizing itself in multiplicity, *i.e.* as nature. In the present I am conscious to myself of my reality, and consequently self-consciousness finds itself as matter, finds the soul to be material, and conceptions to be movements and changes in the inner organ of the brain, which result from external impressions on the senses. Thought is therefore a mode of the existence of matter. The One Substance of Spinoza, to which French materialism as naturalism is parallel, really finds its accomplishment here in this object as in all respects the ultimate; but while in Spinoza this category is a possession which we find ready to hand, here it appears as the result of the abstraction of the understanding proceeding from empiricism.

The other form of the *Aufklärung* is, on the contrary, when absolute Being is set forth as something beyond self-consciousness, so that of itself, of its implicit Being, nothing whatever can be known. It bears the empty name of God. For though God may be determined in any way whatever, all these determinations fall away; He is, like *x*, the altogether unknown quantity. This view is not therefore to be termed atheism, in the first place because it still employs the empty, meaningless name, and in the second

place because it expresses the necessary relations of self-consciousness, duties, &c., not as necessary in an absolute sense, but as necessary through relation to another, namely to the unknown — although there can be no positive relation to an unknown except by abrogating the self as particular. Yet it is not matter, because this simple and empty something is negatively defined as non-existent for self-consciousness. This all comes to the same thing, however, for matter is the universal, and is Being-for-self represented as abrogated. But the true reflection on that unknown is this, that it exists for self-consciousness simply as a negative of the same, *i.e.* as matter, reality, the present; it is this negative for me, this is its Notion. The difference distinguishing this from what appears to be in its entirety something "other," and in which any one side is not permitted to say that what it thinks is such is that particular thing, is the difference which rests on this last abstraction.

Since then the Notion is present only in its negative form, positive extension remains without a Notion; it has the form of nature, of an existent, both in the physical and in the moral sphere. The knowledge of nature remains the ordinary, scientifically unspeculative knowledge, and as to its essence, in so far as it claims to be philosophy, it is a general way of speaking that plays with the words, "forces, relations, manifold connections," but arrives at nothing definite. Similarly, in the spiritual sphere, it is so far true that the metaphysic of the spirit is of such a nature that it is nothing more nor less than a particular organization by means of which the powers which are termed sensation, perception, &c., come into existence; but this is a wearisome way of talking, which can make nothing intelligible, which accepts appearances and perceptions and reasons about them, but none the less reduces their implicit existence to certain determinate forces, of the inward nature of which we know nothing further. The determination and knowledge of the moral sphere has similarly for its

object to bring man back to his so-called natural promptings; its essence has the form of a natural impulse, and this natural impulse is termed self-love, selfishness, or benevolence. It is required that man should live in conformity with nature; but this nature does not reach further than general expressions and descriptions, such as the state of nature we find depicted by Rousseau. What is called the metaphysic of ordinary conceptions is the empiricism of Locke, which seeks to show their origin to be in consciousness, in as far as it is individual consciousness; which, when born into the world, emerges out of unconsciousness in order to acquire knowledge as sensuous consciousness. This external origin they confound with the Becoming and Notion of the matter in point. If one were to ask vaguely what is the origin and genesis of water, and the answer were to be given that it comes from the mountains or from rain, this would be a reply in the spirit of the above philosophy. In short, it is only the negative aspect that is interesting, and as for this positive French philosophy, it is out of the question. But even the negative side of it belongs properly to culture mainly, with which we have here nothing to do, and the *Aufklärung* likewise belongs to the same. In the French philosophic writings, which in this respect are of importance, what is worthy of admiration is the astonishing energy and force of the Notion as directed against existence, against faith, against all the power of authority that had held sway for thousands of years. On the one hand we cannot help remarking the feeling of utter rebellion against the whole state of affairs at present prevailing, a state which is alien to self-consciousness, which would fain dispense with it, and in which self-consciousness does not find itself; there is a certainty of the truth of reason, which challenges the whole intellectual world as it stands aloof, and is confident of destroying it. French atheism, materialism, or naturalism has overcome all prejudices, and has been victorious over the senseless hypotheses and assumptions of the positive element in religion, which is

associated with habits, manners, opinions, determinations as to law and morality and civil institutions. With the healthy human understanding and earnestness of spirit, and not with frivolous declamations, it has rebelled against the condition of the world as legally established, against the constitution of the state, the administration of justice, the mode of government, political authority, and likewise against art.

Contrasting with this barren content there is the other and fertile side. The positive is in its turn constituted by so-called immediately enlightening truths of the healthy human understanding, which contains nothing except this truth and the claim to find itself, and beyond this form does not pass. But in so doing there arises the endeavour to grasp the absolute as something present, and at the same time as an object of thought and as absolute unity: an endeavour which, as it implies denial of the conception of design both in the natural and in the spiritual sphere — the former involving the idea of life, and the latter that of spirit and freedom — only reaches to the abstraction of a nature undetermined in itself, to sensation, mechanism, self-seeking, and utility. It is this then that we shall have to make evident in the positive side of French philosophy. In their political constitutions the French have, it is true, started from abstractions, but they have done so as from universal thoughts, which are the negative of reality; the English, on the other hand, proceed from concrete reality, from the unwieldy structure of their constitution; just as their writers even have not attained to universal principles. What Luther began in the heart only and in the feelings — the freedom of spirit which, unconscious of its simple root, does not comprehend itself, and yet is the very universal itself, for which all content disappears in the thought that fills itself with itself — these universal determinations and thoughts the French asserted and steadfastly adhered to: they are universal principles, in the form of the conviction of the individual in himself. Freedom becomes the condition of the world, connects itself

with the world's history and forms epochs in the same; it is the concrete freedom of the spirit, a concrete universality; fundamental principles as regards the concrete now take the place of the abstract metaphysic of Descartes. Among the Germans we find mere chatter; they would have liked to offer explanations also, but all they have to give is in the form of miserable phenomena and individualism. The French, from their starting-point of the thought of universality, and the German liberty of conscience starting from the conscience which teaches us to "Prove all things," to "hold fast that which is good," have, however, joined hands with one another, or they follow the same path. Only the French, as though they were without conscience, have made short work of everything, and have systematically adhered to a definite thought — the physiocratic system; while the Germans wish to leave themselves a free retreat, and examine from the standpoint of conscience whether a certain course is permissible. The French warred against the speculative Notion with the spirit, the Germans did so with the understanding. We find in the French a deep all-embracing philosophic need, different from anything in the English and Scotch and even in the Germans, and full of vitality: it is a universal concrete view of all that exists, with entire independence both of all authority and of all abstract metaphysics. The method employed is that of development from perception, from the heart; it is a comprehensive view of the entire matter, which keeps the whole ever in sight, and seeks to uphold and attain to it.

This healthy human understanding, this sound reason, with its content taken from the human breast, from natural feeling, has directed itself against the religious side of things in various moments: on the one hand and first of all, as French philosophy, it did so against the Catholic religion, the fetters of superstition and of the hierarchy; on the other hand, in less pronounced form, as the German "illumination," against the Protestant religion, in as far as it has a content which it has derived from revelation,

from ecclesiastical authority in general. On the one hand the form of authority in general was challenged, and on the other hand its matter. The content can be easily enough disposed of by this form of thought, which is not what we understand by reason, but which must be termed understanding; it is easy for the understanding to show objections to the ultimate principles of what can be comprehended only by means of speculation. The understanding has thus tried the content of religion by its standard, and has condemned it; the understanding proceeds in the same way against a concrete philosophy. What of religion has in many theologies been very commonly left remaining is what is termed theism, faith in general; this is the same content which is found also in Mohammedanism. But along with this attack upon religion on the part of the reasoning understanding there has been also a movement towards materialism, atheism and naturalism. It is true that we should not make the charge of atheism lightly, for it is a very common occurrence that an individual whose ideas about God differ from those of other people is charged with lack of religion, or even with atheism. But here it really is the case that this philosophy has developed into atheism, and has defined matter, nature, &c., as that which is to be taken as the ultimate, the active, and the efficient. Some Frenchmen, Rousseau for instance, are not, however, to be included with the rest; one of this author's works, "The Confession of Faith of a Vicar,"[304] contains the very same theism which is found in German theologians. Thus French metaphysics finds a parallel not only in Spinoza (*supra*, p. 382) but also in the German metaphysics of Wolff. Other Frenchmen have confessedly gone over to naturalism; among them is specially to be mentioned Mirabaud, to whom the *Système de la Nature* is attributed.

In what has been termed French philosophy, represented by Voltaire, Montesquieu, Rousseau, d'Alembert, Diderot, and in what subsequently

appeared in Germany as the *Aufklärung*, and has been also stigmatized as atheism, we may now distinguish three aspects, first, the negative side, to which most exception has been taken; secondly, the positive side; thirdly, the philosophical, metaphysical side.

1. The Negative Aspect.

Justice must be done even to this negative side, as to everything else; what is substantial in it is the attack of the reasoning instinct against a condition of degeneracy, I may even say of utter and universal falsehood; for instance, against the positive side of a religion that has become wooden and lifeless. What we call religion is firm faith, conviction that there is a God; if this is faith in the doctrines of Christianity, it is more or less abstracted from. But in this attack against religion we have to think of something quite different from the above; in what we find here, the positive of religion is the negative of reason. If we would understand the feeling of indignation to which these writers give utterance, we must keep before our eyes the state of religion in those days, with its might and magnificence, the corruption of its manners, its avarice, its ambition, its luxury, for which nevertheless reverence was claimed — a state of contradiction present and existent. We perceive into what a frightful condition of formalism and deadness positive religion had sunk, as had the bonds of society as well, the means employed for the administration of justice, the power of the state. This French philosophy also attacked the state; it assailed prejudices and superstition, especially the depravity of civic life, of court manners and of Government officials; it laid hold of and brought to light the evil, the ridiculous, the base, and exposed the whole tissue of hypocrisy and unjust power to the derision, the contempt and the hatred of the world at large, and thus brought men's minds and hearts into a state of indifference to the idols of the world and indignation

against them. Old institutions, which in the sense of self-conscious freedom and humanity that had developed, no longer found a place, and which had formerly been founded and upheld by mutual good feeling and the obtuseness of a consciousness unconscious of self, institutions which were no longer in harmony with the spirit that had established them, and now, in consequence of the advance that had been made in scientific culture, were bound to make good to reason their claim to be sacred and just, — this was the formalism that those philosophers overthrew. In making their attacks, they wrote sometimes with reasoned argument, sometimes satirically, sometimes in the language of plain common-sense, and they did not wage war on what we call religion; that was left quite unharmed, and its claims were urged with words of choicest eloquence. Those who enforced these views were therefore agents of destruction against that alone which was in itself already destroyed. We place it to our credit when we reproach the French for their attacks upon religion and on the state. We must represent to ourselves the horrible state of society, the misery and degradation in France, in order to appreciate the services that these writers rendered. Hypocrisy and cant, imbecility of mind and the tyranny which sees itself robbed of its prey, may say that attacks were made on religion, on the state, and on manners. But what a religion! Not the religion that Luther purified, but the most wretched superstition, priestly domination, stupidity, degradation of mind, and more especially the squandering of riches and the revelling in temporal possessions in the midst of public misery. And what a state! The blindest tyranny of ministers and their mistresses, wives and chamberlains; so that a vast army of petty tyrants and idlers looked upon it as a right divinely given them to plunder the revenues of the state and lay hands upon the product of the nation's sweat. The shamelessness, the dishonesty were past belief; and morals were simply in keeping with the corruptness of the institutions. We see the law defied by individuals in respect to civil and

political life; we see it likewise set at nought in respect to conscience and thought.

In regard to practical politics, the writers in question never even thought of a revolution, but desired and demanded reforms alone, and that these should be subjective mainly; they called on the Government to sweep away abuses, and appoint honourable men as ministers. The positive recommendations made by them as to the course to be pursued were, for example, that the royal children should receive a good upbringing, that princes should be of frugal habits, &c. The French Revolution was forced on by the stiff-necked obstinacy of prejudices, by haughtiness, utter want of thought, and avarice. The philosophers of whom we are speaking were able to give only a general idea of what ought to be done; they could not indicate the mode in which the reforms were to be carried out. It was the Government's business to make arrangements and carry out reforms in concrete shape; but it did not perceive this. What the philosophers brought forward and maintained as a remedy for this horrible state of disorder was, speaking generally, that men should no longer be in the position of laymen, either with regard to religion or to law; so that in religious matters there should not be a hierarchy, a limited and selected number of priests, and in the same way that there should not be in legal matters an exclusive caste and society (not even a class of professional lawyers), in whom should reside, and to whom should be restricted, the knowledge of what is eternal, divine, true, and right, and by whom other men should be commanded and directed; but that human reason should have the right of giving its assent and its opinion. To treat barbarians as laymen is quite as it should be — barbarians are nothing but laymen; but to treat thinking men as laymen is very hard. This great claim made by man to subjective freedom, perception and conviction, the philosophers in question contended for heroically and with splendid genius, with warmth and fire, with spirit and courage,

maintaining that a man's own self, the human spirit, is the source from which is derived all that is to be respected by him. There thus manifests itself in them the fanaticism of abstract thought. We Germans were passive at first with regard to the existing state of affairs, we endured it; in the second place, when that state of affairs was overthrown, we were just as passive: it was overthrown by the efforts of others, we let it be taken away from us, we suffered it all to happen.

In Germany, Frederick II. allied himself with this culture, a rare example in those days. French court manners, operas, gardens, dresses, were widely adopted in Germany, but not French philosophy; yet in the form of wit and jest much of it found its way into this upper world, and much that was evil and barbarous was driven away. Frederick II., without having been brought up on melancholy psalms, without having had to learn one or two of them every day by heart, without the barbarous metaphysics and logic of Wolff (for what did he find to admire in Germany except Gellert?), was well acquainted with the great, although formal and abstract principles of religion and the state, and governed in accordance therewith, as far as circumstances allowed. Nothing else was at that time required in his nation; one cannot ask that he should have reformed and revolutionized it, since not a single person yet demanded representative government and the publicity of courts of justice. He introduced what there was need of, religious tolerance, legislation, improvements in the administration of justice, economy in the revenues of state; of the wretched German law there remained no longer in his states even the merest phantom. He showed what was the object and purpose of the state, and at the same time cast down all privileges, the private rights which pertained to Germans, and arbitrary statute laws. It is foolish when cant and German pseudo-patriotism pounce down upon him now, and try to disparage the greatness of a man whose influence was so enormous, and would even detract from his fame by a

charge of vanity and wickedness. What German patriotism aims at should be reasonable.

2. The Positive Aspect.

The affirmative content of this philosophy certainly does not satisfy the requirements of profundity. A leading characteristic of its teaching, which is found also with the Scottish philosophers and with ourselves, is the assumption of primitive feelings of justice which man has in himself, as for example benevolence and social instincts which should be cultivated. The positive source of knowledge and of justice is placed in human reason and the common consciousness of mankind, in the healthy human reason, and not in the form of the Notion. It is certainly wonderful to find truths expressed in the form of universal thoughts, respecting which it is of infinite importance that they should be assumptions present in the human mind: that man has in his heart the feeling of right, of love to his fellow-creatures: that religion and faith are not matters of compulsion; that merit, talent, virtue are the true nobility, &c. An important question, especially among the Germans, was what is the end and character of man, by which was meant the nature of his mind and spirit; and certainly, as far as the spiritual is concerned, it is to this point that we must return. But in order to find the nature of spirit, to discover what this determination is, a return was made to perception, observation, experience, to the existence of certain impulses. These are certainly determinations in ourselves, but we have not known them in their necessity. Such an impulse is besides taken as natural, and thus it is here indeterminate in itself, it has its limitation only as a moment of the whole. In regard to knowledge, very abstract thoughts are to be found — though of a truth they are quite as good as ours, and more ingenious — which according to their content ought to be concrete, and also

were so. But so superficially were they comprehended that they soon showed themselves far from sufficient for what had to be derived from them. They said, for instance, that Nature is a whole, that all is determined by laws, through a combination of different movements, through a chain of causes and effects, and so on; the various properties, materials, connections of things bring everything to pass. These are general phrases, with which one can fill whole books.

a. Système de la Nature.

To this philosophy belongs the *Système de la Nature*, the leading work on the subject, written in Paris by a German, Baron von Hollbach, who was the central figure of all those philosophers. Montesquieu, d'Alembert, Rousseau, were for a time in his circle; however much these men were moved to indignation at the existing state of things, they were yet in other respects very different from one another. The *Système de la Nature* may very easily be found tiresome to read, because it treats discursively of general conceptions, which are often repeated; it is not a French book, for vivacity is lacking and the mode of presentation is dull.

The great Whole of Nature (*le grand tout de la nature*) is the ultimate: "The universe displays nothing but an immense collection of matter and motion" (as with Descartes), "an unbroken chain of causes and effects, of which causes some directly affect our senses, while others are unknown to us, because their effects, which we perceive, are too remote from their causes. The different qualities of these materials, their manifold connections, and the effects which result therefrom, constitute essences for us. From the diversity of these essences arise the different orders, species, systems, under which things fall, and whose sum total, the great whole, is what we call Nature."[305] It is like what Aristotle (*vide* Vol. I. p. 241) says of Xenophanes, that he gazed into the blue, *i.e.* into Being. According to

Hollbach all is movement, matter moves itself: beer ferments, the soul is moved by its passions.[306] "The manifold variety of natural phenomena, and their incessant rise and disappearance, have their sole ground in the variety of motions and of their material." Through different combinations and modifications, through a different arrangement, another thing is originated. "Material substances have either a tendency to combine with one another, or else they are incapable of so combining. Upon this are based by physical scientists the forces of attraction and repulsion, sympathy and antipathy, affinity and relation; and the moralists base thereon hatred and love, friendship and enmity." Spirit, the incorporeal, contradicts or opposes itself to motion, to a change of the relations of a body in space.[307]

b. Robinet.

Another work of importance is the still more "dangerous" treatise, *De la Nature*, by Robinet. In it there reigns quite a different and a deeper spirit; one is frequently struck by the depth of earnestness which the writer displays. He begins thus: "There is a God, *i.e.* a cause of the phenomena of that Whole which we call Nature. Who is God? We know not, and we are so constituted that we can never know in what order of things we have been placed. We cannot know God perfectly, because the means of doing so will always be lacking to us. We too might write over the doors of our temples the words which were to be read upon the altar which the Areopagite raised, 'To the unknown God.'" The very same thing is said now-a-days: there can be no transition from the finite to the infinite. "The order which reigns in the universe is just as little the visible type of His wisdom, as our weak mind is the image of His intelligence." But this First Cause, God, is according to Robinet a creative God, He has brought Nature into existence; so that for him the only possible knowledge is that of Nature. "There is only One Cause. The eternal Cause, who so to speak had sown (*engrainé*) events

one in the other, in order that they might without fail follow one upon another as He chose, in the beginning set in motion the endless chain of things. Through this permanent impression the Universe goes on living, moving and perpetuating itself. From the unity of cause there follows the unity of activity, for even it does not appear as something to be more or less admitted. By virtue of this single act all things come to pass. Since man has made Nature his study, he has found no isolated phenomenon, and no independent truth, because there are not and cannot be such. The whole sustains itself through the mutual correspondence of its parts."[308] The activity of Nature is one, as God is One.

This activity, more particularly regarded, signifies that germs unfold themselves in everything: everywhere there are organic Beings which produce themselves; nothing is isolated, everything is combined and connected and in harmony. Robinet here goes through the plants, the animals, and also the metals, the elements, air, fire, water, &c.; and seeks from them to demonstrate the existence of the germ in whatever has life, and also how metals are organized in themselves. "The example of the polypus is convincing as to the animal nature (*animalité*) of the smallest portions of organized matter; for the polypus is a group of associated polypi, each of which is as much a true polypus as the first. It stands proved that from the same point of view the living consists only of the living, the animals of minute animals, every animal in particular of minute animals of the same kind, a dog of dog-germs, man of human germs." In proof of this Robinet states in a "Recapitulation" that "animal sperm swarms with spermatic animalcules." Since he then connects every propagation properly so-called with the co-operation of both sexes, he alleges that every individual is inwardly or also in the external organs a hermaphrodite. Of the minerals he says: "Are we not compelled to regard as organic bodies all those in which we meet with an inward structure such as this? It

presupposes throughout a seed, seed-granules, germs, of which they are the development.” In the same way the air must have its germ, which does not come to reality until it is nourished by water, fire, &c. “The air, as principle, is only the germ of the air; as it impregnates or saturates itself in varying degrees with water and fire, it will gradually pass through different stages of growth: it will become first embryo, then perfect air.”[309] Robinet gives the name of germ to the simple form in itself, the substantial form, the Notion. Although he seeks to prove this too much from the sensuous side, he yet proceeds from principles in themselves concrete, from the form in itself.

He speaks also of the evil and good in the world. The result of his observation is that good and evil balance each other; this equilibrium constitutes the beauty of the world. In order to refute the assertion that there is more good than evil in the world, he says that everything to which we reduce the good consists only in an enjoyment, a pleasure, a satisfaction; but this must be preceded by a want, a lack, a pain, the removal of which constitutes satisfaction.[310] This is not only a correct thought empirically, but it also hints at the deeper idea that there is no activity except through contradiction.

3. Idea of a Concrete Universal Unity.

The result of the French philosophy is that it insisted on maintaining a general unity, not abstract, but concrete. Thus Robinet now propounded the theory of a universal organic life, and a uniform mode of origination; this concrete system he called Nature, over which God was set, but as the unknowable; all predicates which could be expressed of Him contained something inapplicable. We must admit that grand conceptions of concrete unity are to be found here, as opposed to the abstract metaphysical determinations of the understanding, *e.g.* the fruitfulness of Nature. But, on the other hand, the point of most importance with these philosophers is that

what is to be accepted as valid must have presence, and that man in all knowledge must be himself the knower; for, as we may see, those philosophers made war on all external authority of state and church, and in particular on abstract thought which has no present meaning in us. Two determinations found in all philosophy are the concretion of the Idea and the presence of the spirit in the same; my content must at the same time be something concrete, present. This concrete was termed Reason, and for it the more noble of those men contended with the greatest enthusiasm and warmth. Thought was raised like a standard among the nations, liberty of conviction and of conscience in me. They said to mankind, "In this sign thou shalt conquer," for they had before their eyes what had been done in the name of the cross alone, what had been made a matter of faith and law and religion — they saw how the sign of the cross had been degraded. For in the sign of the cross lying and deceit had been victorious, under this seal institutions had become fossilized, and had sunk into all manner of degradation, so that this sign came to be represented as the epitome and root of all evil. Thus in another form they completed the Reformation that Luther began. This concrete had manifold forms; social instincts in the practical sphere, laws of nature in the theoretical. There is present the absolute impulse to find a compass immanent in themselves, *i.e.* in the human mind. For the human mind it is imperative to have a fixed point such as this, if, indeed, it is to be within itself, if it is to be free in its own world at least. But this striving after really present vitality took forms which as by-paths were themselves one-sided. In this striving after unity, which was, however, concrete unity, the further varieties of the content likewise lie.

On the theoretic side of their philosophy, therefore, the French proceeded to materialism or naturalism, because the requirements of the understanding, as abstract thought, which from a firmly fixed principle allows the most monstrous consequences to be drawn, drove them to set up

one principle as ultimate, and that a principle which had at the same time to be present and to lie quite close to experience. Hence they accept sensation and matter as the only truth, to which must be reduced all thought, all morality, as a mere modification of sensation. The unities which the French propounded were in this way one-sided.

a. Opposition of Sensation and Thought.

To this one-sidedness belongs the opposition between *sentir* and *penser*, or else, if you like, their identity, making the latter only a result of the former; there is not, however, any speculative reconciliation of this opposition in God, such as we find in Spinoza and Malebranche. This reduction of all thought to sensation, which in certain respects took place with Locke, becomes a widely extended theory. Robinet (*De la Nature*, T. I. P. IV. chap. iii. pp. 257-259) lights also on this opposition, beyond which he does not get, that mind and body are not separate, but that the manner in which they are united is inexplicable. The *Système de la Nature* (T. I. chap. x. p. 177) is marked by an especially plain reduction of thought to sensation. The leading thought is this: "Abstract thoughts are only modes in which our inmost organ views its own modifications. The words goodness, beauty, order, intelligence, virtue, &c., have no meaning for us if we do not refer and apply them to objects which our senses have shown to be capable of these qualities, or to modes of being and acting which are known to us." Thus even psychology passed into materialism, as for instance we may find in La Mettrie's work *L'homme Machine*: All thought and all conception have meaning only if they are apprehended as material; matter alone exists.

b. Montesquieu.

Other great writers have opposed to the above the feeling in the breast, the instinct of self-preservation, benevolent dispositions towards others, the

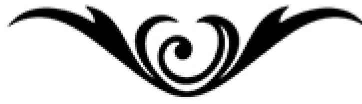
impulse to fellowship, which last Puffendorf also made the foundation of his system of law (*supra*, p. 321). From this point of view much that is excellent has been said. Thus Montesquieu, in his charming book, *L'Esprit des Lois*, of which Voltaire said it was an *esprit sur les lois*, regarded the nations from this important point of view, that their constitution, their religion, in short, everything that is to be found in a state, constitutes a totality.

c. Helvetius.

This reduction of thought to feeling in the case of Helvetius takes the form that if in man as a moral being a single principle is sought, this ought to be called self-love, and he endeavoured to demonstrate by ingenious analysis that whatever we term virtue, all activity and law and right, has as its foundation nothing but self-love or selfishness, and is resolvable thereinto.[311] This principle is one-sided, although the "I myself" is an essential moment. What I will, the noblest, the holiest, is *my* aim; I must take part in it, I must agree to it, I must approve of it. With all self-sacrifice there is always conjoined some satisfaction, some finding of self; this element of self, subjective liberty, must always be present. If this is taken in a one-sided sense, there may be consequences drawn from it which overthrow all that is sacred; but it is found in equal degree in a morality as noble as any possibly can be.

d. Rousseau.

In connection with the practical side of things this particular must also be noted, that when the feeling of right, the concrete practical mind, and, speaking generally, humanity and happiness were made the principle, this principle, universally conceived, had certainly the form of thought; but in



the case of such concrete content derived from our impulse or inward intuition, even though that content were religious, the thought itself was not the content. But now this further phase appeared, that pure thought was set up as the principle and content, even if again there was lacking to this content the true consciousness of its peculiar form; for it was not recognized that this principle was thought. We see it emerge in the sphere of will, of the practical, of the just, and so apprehended that the innermost principle of man, his unity with himself, is set forth as fundamental and brought into consciousness, so that man in himself acquired an infinite strength. It is this that Rousseau from one point of view said about the state. He investigated its absolute justification, and inquired as to its foundation. The right of ruling and associating, of the relation of order, of governing and being governed, he apprehends from his own point of view, so that it is made to rest historically on power, compulsion, conquest, private property, &c.[312]

Rousseau makes free-will the principle of this justification, and without reference to the positive right of states he made answer to the above question (chap. iv. p. 12), that man has free-will, because "liberty is the distinguishing feature of man. To renounce his liberty signifies to renounce his manhood. Not to be free is therefore a renunciation of a man's rights as a human being, and even of his duties." The slave has neither rights nor duties. Rousseau therefore says (chap. vi. p. 21): "The fundamental task is to find a form of association which will shield and protect with the power of the whole commonwealth combined the person and property of every one of its members, and in which each individual, while joining this association, obeys himself only, and thus remains as free as before. The solution is given by the Social Contract;" this is the association of which each is a member by his own will. These principles, thus abstractly stated, we must allow to be correct, yet the ambiguity in them soon begins to be felt. Man is free, this is certainly the substantial nature of man; and not only is this liberty not

relinquished in the state, but it is actually in the state that it is first realized. The freedom of nature, the gift of freedom, is not anything real; for the state is the first realization of freedom.

The misunderstanding as to the universal will proceeds from this, that the Notion of freedom must not be taken in the sense of the arbitrary caprice of an individual, but in the sense of the rational will, of the will in and for itself. The universal will is not to be looked on as compounded of definitively individual wills, so that these remain absolute; otherwise the saying would be correct: "Where the minority must obey the majority, there is no freedom." The universal will must really be the rational will, even if we are not conscious of the fact; the state is therefore not an association which is decreed by the arbitrary will of individuals. The wrong apprehension of these principles does not concern us. What does concern us is this, that thereby there should come into consciousness as content the sense that man has liberty in his spirit as the altogether absolute, that free-will is the Notion of man. Freedom is just thought itself; he who casts thought aside and speaks of freedom knows not what he is talking of. The unity of thought with itself is freedom, the free will. Thought, as volition merely, is the impulse to abrogate one's subjectivity, the relation to present existence, the realizing of oneself, since in that I am endeavouring to place myself as existent on an equality with myself as thinking. It is only as having the power of thinking that the will is free. The principle of freedom emerged in Rousseau, and gave to man, who apprehends himself as infinite, this infinite strength. This furnishes the transition to the Kantian philosophy, which, theoretically considered, made this principle its foundation; knowledge aimed at freedom, and at a concrete content which it possesses in consciousness.

D. The German Illumination.

THE GERMANS WERE at this time quietly drifting along in their Leibnitzo-Wolffian philosophy, in its definitions, axioms and proofs. Then they were gradually breathed upon by the spirit of foreign lands, they made acquaintance with all the developments which there came to pass, and took very kindly to the empiricism of Locke; on the other hand they at the same time laid aside metaphysical investigations, turned their attention to the question of how truths can be grasped by the healthy human understanding, and plunged into the *Aufklärung* and into the consideration of the utility of all things — a point of view which they adopted from the French. Utility as the essence of existent things signifies that they are determined as not being in themselves, but for another: this is a necessary moment, but not the only one. The German *Aufklärung* warred against ideas, with the principle of utility as its weapon. Philosophic investigations on this subject had degenerated into a feeble popular treatment of it which was incapable of going deeper; they displayed a rigid pedantry and an earnestness of the understanding, but were unspiritual. The Germans are busy bees who do justice to all nations, they are old-clothesmen for whom anything is good enough, and who carry on their haggling with everyone. Picked up as it was from foreign nations, all this had lost the wit and life, the energy and originality which with the French had made the content to be lost sight of in the form. The Germans, who honestly sift a matter to its root, and who would put rational arguments in the place of wit and vivacity, since wit and vivacity really prove nothing, in this way reached a content which was utterly empty, so much so that nothing could be more wearisome than this

profound mode of treatment; such was the case with Eberhard, Tetens, and those like them.

Others, like Nicolai, Sulzer and their fellows, were excellent in their speculations on questions of taste and the liberal sciences; for literature and art were also to flourish among the Germans. But with all this they only arrived at a most trivial treatment of æsthetics — Lessing[313] called it shallow chatter. As a matter of fact, indeed, the poems of Gellert, Weisse and Lessing sank almost, if not quite as much into the same poetic feebleness. Moreover, previous to the philosophy of Kant, the general principle was really the theory of happiness, which we have already met with in the philosophy of the Cyrenaics (Vol. I. p. 477), and the point of view of pleasant or unpleasant sensations held good among the philosophers of that time as an ultimate and essential determination. Of this manner of philosophizing I will quote an example which Nicolai gives in the account of a conversation which he had with Mendelssohn: what is in question is the pleasure in tragic subjects which is held to be awakened even by means of the unpleasant emotions depicted in a tragedy:

Herr Moses.

"The power of having an inclination for perfections and of shunning imperfections is a reality." Therefore the exercise of this power brings a pleasure with it, which, however, is in nature comparatively less than the displeasure which arises from the contemplation of the object.

I.

Yet even then, when the violence of passion causes us unpleasant sensations, the movement (what else is this movement than the power of loving perfections, &c.?) which it brings with it has still delights for us. It is the strength of the movement which we enjoy, even in spite of the painful

sensations which oppose what is pleasant in the passion, and in a short time obtain the victory.

Herr Moses.

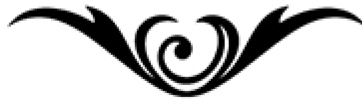
In a stage play, on the contrary, as the imperfect object is absent, pleasure must gain the upper hand and eclipse the small degree of displeasure.

I.

A passion therefore which is not followed by these results must be altogether pleasant. Of this sort are the imitations of the passions which the tragedy affords."[314]

With such vapid and meaningless drivel they rambled on. In addition to these, the eternity of punishment in hell, the salvation of the heathen, the difference between uprightness and godliness, were philosophic matters on which much labour was expended among the Germans, while the French troubled themselves little about them. Finite determinations were made to hold good against the infinite; against the Trinity it was asserted that One cannot be Three; against original sin, that each must bear his own guilt, must have done his own deeds of himself, and must answer for them; in the same way against redemption, that another cannot take upon himself punishment that is due; against forgiveness of sin, that what is done cannot be rendered undone; to sum up generally, the incommensurability of the human nature with the divine. On the one side we see healthy human understanding, experience, facts of consciousness, but on the other side there was still in vogue the Wolffian metaphysics of the dry, dead understanding; thus we see Mendelssohn take his stand by the healthy human understanding, and make it his rule.

Some movement was brought into this authority, which had settled into perfect peace and security and let no dreams of other matters cross its path,

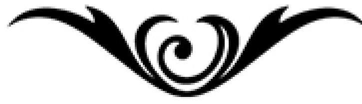


by the chance dispute of Mendelssohn with Jacobi, first as to whether Lessing had been a disciple of Spinoza, and then regarding the doctrines of Spinoza himself. On this occasion it came to light how much Spinoza was really forgotten, and in what horror Spinozism was held. But while Jacobi in this way once more unexpectedly brought to remembrance in connection with Spinozism a quite different content of philosophy, faith, *i.e.* the simply immediate certainty of external, finite things, as well as of the divine (which faith in the divine he called reason) was certainly placed by him, as an independent thinker, in opposition to mediating knowledge, which he apprehended as mere understanding. This continued until Kant gave a new impulse in Germany to philosophy, which had died out in the rest of Europe.

As far as the transition to modern German philosophy is concerned, it is from Hume and Rousseau, as we have said (pp. 369, 374, 402), that it took its start. Descartes opposes extension to thought, as what is simply one with itself. He is charged with dualism, but, like Spinoza and Leibnitz, he did away with the independence of the two sides, and made supreme their unity, God. But, as this unity, God is first of all only the Third; and He is further determined in such a way that no determination pertains to Him. Wolff's understanding of the finite, his school metaphysics generally, his science of the understanding, and his divergence into the observation of nature, after it has grown strong in its conformity with law and in its finite knowledge, turns against the infinite and the concrete determinations of religion, and comes to a standstill with abstractions in his *theologia naturalis*; for the determinate is his domain. But from this time an utterly different point of view is introduced. The infinite is transported into abstraction or incomprehensibility. This is an incomprehensible position to adopt. Nowadays it is looked on as most pious, most justifiable. But as we see the third, the unity of differences, defined as something which cannot be

thought or known, this unity is not one of thought, for it is above all thought, and God is not simply thought. Nevertheless this unity is defined as the absolutely concrete, *i.e.* as the unity of thought and Being. Now we have come so far that this unity is a unity simply in thought, and pertaining to consciousness, so that the objectivity of thought — reason — comes forth as One and All. This is dimly conceived by the French. Whether the highest Being, this Being divested of all determination, is elevated above nature, or whether nature or matter is the highest unity, there is always present the establishing of something concrete, which at the same time belongs to thought. Since the liberty of man has been set up as an absolutely ultimate principle, thought itself has been set up as a principle. The principle of liberty is not only in thought but the root of thought; this principle of liberty is also something in itself concrete, at least in principle it is implicitly concrete. Thus far have general culture and philosophic culture advanced. Since what is knowable has now been placed entirely within the sphere of consciousness, and since the liberty of the spirit has been apprehended as absolute, this may be understood to mean that knowledge has entered altogether into the realm of the finite. The standpoint of the finite was at the same time taken as ultimate, and God as a Beyond outside consciousness; duties, rights, knowledge of nature, are finite. Man has thereby formed for himself a kingdom of truth, from which God is excluded; it is the kingdom of finite truth. The form of finitude may here be termed the subjective form; liberty, self-consciousness [Ichheit] of the mind, known as the absolute, is essentially subjective — in fact it is the subjectivity of thought. The more the human reason has grasped itself in itself, the more has it come down from God and the more has it increased the field of the finite. Reason is One and All, which is at the same time the totality of the finite; reason under these conditions is finite knowledge and knowledge of the finite. The question is, since it is this concrete that is

established (and not metaphysical abstractions), how it constitutes itself in itself; and then, how it returns to objectivity, or abrogates its subjectivity, *i.e.* how by means of thought God is to be again brought about, who at an earlier time and at the beginning of this period was recognized as alone the true. This is what we have to consider in the last period, in dealing with Kant, Fichte, and Schelling.



SECTION THREE. Recent German Philosophy

IN THE PHILOSOPHY of Kant, Fichte, and Schelling, the revolution to which in Germany mind has in these latter days advanced, was formally thought out and expressed; the sequence of these philosophies shows the course which thought has taken. In this great epoch of the world's history, whose inmost essence is laid hold of in the philosophy of history, two nations only have played a part, the German and the French, and this in spite of their absolute opposition, or rather because they are so opposite. The other nations have taken no real inward part in the same, although politically they have indeed so done, both through their governments and their people. In Germany this principle has burst forth as thought, spirit, Notion; in France, in the form of actuality. In Germany, what there is of actuality comes to us as a force of external circumstances, and as a reaction against the same. The task of modern German philosophy is, however, summed up in taking as its object the unity of thought and Being, which is the fundamental idea of philosophy generally, and comprehending it, that is, in laying hold of the inmost significance of necessity, the Notion (*supra*, p. 360). The philosophy of Kant sets forth, in the first place, the formal aspect of the task, but it has the abstract absoluteness of reason in self-consciousness as its sole result, and, in one respect, it carried with it a certain character of shallowness and want of vigour, in which an attitude of criticism and negativity is retained, and which, as far as any positive element is concerned, adheres to the facts of consciousness and to mere conjecture, while it renounces thought and returns to feeling. On the other hand, however, there sprang from this the philosophy of Fichte, which speculatively grasps the essence of self-consciousness as concrete egoism,

but which does not reach beyond this subjective form pertaining to the absolute. From it again comes the philosophy of Schelling, which subsequently rejects Fichte’s teaching and sets forth the Idea of the Absolute, the truth in and for itself.

A. Jacobi.

IN CONNECTION WITH Kant we must here begin by speaking of Jacobi, whose philosophy is contemporaneous with that of Kant; in both of these the advance beyond the preceding period is very evident. The result in the two cases is much the same, although both the starting point and the method of progression are somewhat different. In Jacobi's case the stimulus was given mainly by French philosophy, with which he was very conversant, and also by German metaphysics, while Kant began rather from the English side, that is, from the scepticism of Hume. Jacobi, in that negative attitude which he preserved as well as Kant, kept before him the objective aspect of the method of knowledge, and specially considered it, for he declared knowledge to be in its content incapable of recognizing the Absolute: the truth must be concrete, present, but not finite. Kant does not consider the content, but took the view of knowledge being subjective; and for this reason he declared it to be incapable of recognizing absolute existence. To Kant knowledge is thus a knowledge of phenomena only, not because the categories are merely limited and finite, but because they are subjective. To Jacobi, on the other hand, the chief point is that the categories are not merely subjective, but that they themselves are conditioned. This is an essential difference between the two points of view, even if they both arrive at the same result.

Friedrich Heinrich Jacobi, born at Düsseldorf in 1743, held office first in the Duchy of Berg, and then in Bavaria. He studied in Geneva and Paris, associating in the former place with Bonnet and in the latter with Diderot. Jacobi was a man of the highest character and culture. He was long occupied with State affairs, and in Düsseldorf he held a public office which

was connected with the administration of the finance department in the State. At the time of the French Revolution he was obliged to retire. As a Bavarian official he went to Munich, there became President of the Academy of Sciences in 1804, which office he, however, resigned in 1812; for in the Napoleonic period Protestants were decried as demagogues. He lived at Munich till the end of his life, and died at the same place on the 10th of March, 1819.[315]

In the year 1785, Jacobi published Letters on Spinoza, which were written in 1783, on the occasion of the dispute with Mendelssohn above-mentioned (p. 406); for in none of his writings did Jacobi develop his philosophy systematically, he set it forth in letters only. When Mendelssohn wished to write a life of Lessing, Jacobi sent to ask him if he knew that "Lessing was a Spinozist" (Jacobi's Werke, Vol. IV. Sec. 1, pp. 39, 40). Mendelssohn was displeased at this, and it was the occasion of the correspondence. In the course of the dispute it was made evident that those who held themselves to be professed philosophers and possessed of a monopoly of Lessing's friendship, such as Nicolai, Mendelssohn, &c., knew nothing about Spinozism; not only was there manifested in them the superficial character of their philosophic insight, but ignorance as well; with Mendelssohn, for instance, this was shown respecting even the outward history of the Spinozistic philosophy, and much more regarding the inward (Jacobi's Werke, Vol. IV. Sec. 1, p. 91). That Jacobi asserted Lessing to be a Spinozist, and gave a high place to the French — this serious statement came to these good men as a thunderbolt from the blue. They — the self-satisfied, self-possessed, superior persons — were quite surprised that he also made pretensions to knowledge, and of such a "dead dog" as Spinoza (*ibidem*, p. 68). Explanations followed upon this, in which Jacobi further developed his philosophic views.

Mendelssohn is directly opposed to Jacobi, for Mendelssohn took his stand on cognition, placed true existence immediately in thought and conception, and maintained: "What I cannot think as true does not trouble me as doubt. A question which I do not understand, I cannot answer, it is for me as good as no question at all."[316] He continued to argue on these same lines. His proof of the existence of God thus carries with it this necessity of thought, viz. that actuality must plainly be in thought, and a thinker must be presupposed, or the possibility of the actual is in the thinker. "What no thinking Being conceives as possible is not possible, and what is thought by no thinking creature as actual cannot be actual in fact. If we take away from anything whatsoever the conception formed by a thinking Being that that thing is possible or actual, the thing itself is done away with." The Notion of the thing is thus to man the essence of the same. "No finite Being can think the actuality of a thing in its perfection as actual, and still less can he perceive the possibility and actuality of all present things. There must thus be a thinking Being or an understanding which in the most perfect way thinks the content of all possibilities as possible, and the content of all actualities as actual; *i.e.* there must be an infinite understanding, and this is God."[317] Here on the one hand we see a unity of thought and Being, on the other the absolute unity as infinite understanding — the former is the self-consciousness which is apprehended as finite merely. Actuality, Being, has its possibility in thought, or its possibility is thought; it is not a process from possibility to actuality, for the possibility remains at home in the actuality.

Jacobi maintains against these demands of thought — and this in one view is the chief thought in his philosophy — that every method of their demonstration leads to fatalism, atheism, and Spinozism,[318] and presents God as derived and founded upon something else; for comprehending Him signifies demonstrating His dependence. Jacobi thus asserts that mediate

knowledge consists in giving a cause of something which has in its turn a finite effect, and so on; so that a knowledge such as this can all through relate to the finite only.

Jacobi further states upon this subject, in the first place, that "Reason" — later on when he distinguished reason and understanding (of which more hereafter[319]), he altered it to understanding[320]— "can never bring to light more than the conditions of what is conditioned, natural laws and mechanism. We comprehend a thing when we can deduce it from its proximate causes," and not from the remoter causes; the most remote and quite universal cause is always God. "Or" we know the thing if we "perceive its immediate conditions as they come in due succession. Thus, for instance, we comprehend a circle when we can clearly represent to ourselves the mechanism of its origination or its physical conditions; we know the syllogistic formulæ when we have actually come to know the laws to which the human understanding is subject in judgment and conclusion, its physical nature and its mechanism. For this reason we have no conceptions of qualities as such, but only intuitions. Even of our present existence we have a feeling only, but no conceptions. Genuine conceptions we have merely of figure, number, position, movement and the forms of thought; qualities are known and understood, if they are traced back to these and objectively annulled." This is undoubtedly really finite knowledge, which is to give the determinate conditions of anything determinate, to demonstrate it as resulting from another cause, in such a way that each condition is again conditioned and finite. Jacobi continues: "The business of reason is really progressive union and connection, and its speculative business is union and connection in accordance with the known laws of necessity, *i.e.* of identity. Everything that reason can bring forth by means of analysis, combination, judgment, conclusion, and re-conception, consists in nothing but things of nature" (*i.e.* finite things), "and reason itself, as a

limited existence, belongs to these things. But the whole of nature, the sum of all conditioned existence, cannot reveal more to the investigating understanding than what is contained in it, namely, manifold existence, changes, a succession of forms" (the conditioned), "and not an actual beginning" (of the world), "nor a real principle of any objective existence."[321]

But Jacobi in the second place here accepts reason in a wider sense and says: "If we understand by reason the principle of knowledge generally, it is the mind from which the whole living nature of man is constituted; through it man arises; he is a form which it has adopted." With this Jacobi's view of the attempt to know the unconditioned is connected. "I take the whole human being, and find that his consciousness is composed of two original conceptions, the conceptions of the conditioned and the unconditioned. Both are inseparably bound up with one another, and yet in such a way that the conception of the conditioned presupposes the conception of the unconditioned, and can be given in this alone. We are just as certain of its existence as we are of our own conditioned existence, or even more so. Since our conditioned existence rests on an infinitude of mediations, there is opened up to our investigation a vast field which, for the sake of our preservation even, we are forced to work upon." It would, however, be quite another thing to wish to know the unconditioned apart from this practical end. However Jacobi here remarks, "To try to discover the conditions of the unconditioned, to find a possibility for absolute necessity, and to construct this last in order to be able to comprehend it, is what we undertake when we endeavour to make nature an existence comprehensible to us, *i.e.* a merely natural existence, and to bring the mechanism of the principle of mechanism into the light of day. For if everything which can be said to arise and be present in a way comprehensible to us, must arise and be present in a conditioned way, we remain, so long as we continue to comprehend, in a

chain of conditioned conditions. Where this chain breaks off, we cease to comprehend, and there the connection which we call nature likewise ceases. The conception of the possibility of the outward existence of nature would thus be the conception of an absolute beginning or origin of nature; it would be the conception of the unconditioned itself in so far as it is a conditioning of nature not naturally connected, *i.e.* a conditioning of nature unconnected and unconditioned for us. Now should a conception of what is thus unconditioned and unconnected, and consequently supernatural, be possible, the unconditioned must cease to be unconditioned, it must itself receive conditions; and absolute necessity must commence to be possibility in order that it may allow itself to be constructed."[322] This is contradictory.

Jacobi then passes on from this point to the second of his main propositions, "The unconditioned is called the supernatural. Now since everything which lies outside the connection of what is conditioned, of what is naturally mediated, also lies outside the sphere of our clear and certain knowledge, and cannot be understood through conceptions, the supernatural cannot be accepted in any other way by us than that in which it is given to us — namely as a fact. It is! This supernatural, this essence of all essence, all tongues join in proclaiming to be God."[323] God as the universal, the true, is here taken in the sense of a spiritual generally, in the sense of power, wisdom, &c. That God is, however, is to Jacobi not absolutely true; for to knowledge pertains His objective absolute existence, but He cannot be said to be known. It is thus merely a fact of my consciousness that God exists independently apart from my consciousness; this, however, is itself maintained through my consciousness; the subjective attitude of thought is thus to Jacobi the element of most importance. The consciousness of God, which is in our consciousness, is, however, of such a nature that along with the thought of God we have immediately associated the fact that He is. The existence of the supernatural and supersensuous, to which the thought of

man regarding the natural and finite passes on, is just as certain to Jacobi as he is himself. This certainty is identical with his self-consciousness; as certainly as I am, so certainly is God (Jacobi's Werke, Vol. III. p. 35). Since he thus passes back into self-consciousness, the unconditioned is only for us in an immediate way; this immediate knowledge Jacobi calls Faith, inward revelation (Werke, Vol. II. pp. 3, 4); to this appeal can be made in man. God, the absolute, the unconditioned, cannot, according to Jacobi, be proved. For proof, comprehension, means to discover conditions for something, to derive it from conditions; but a derived absolute, God, &c., would thus not be absolute at all, would not be unconditioned, would not be God (Jacobi's Werke, Vol. III. p. 7). This immediate knowledge of God is then the point which is maintained in the philosophy of Jacobi. The faith of Kant and of Jacobi are, however, different. To Kant it is a postulate of reason, it is the demand for the solution of the contradiction between the world and goodness; to Jacobi it is represented on its own account as immediate knowledge.

Everything which has been written upon God since Jacobi's time, by philosophers such as Fries and by theologians, rests on this conception of immediate intellectual knowledge, and men even call this revelation, though in another sense than the revelation of theology. Revelation as immediate knowledge is in ourselves, while the Church holds revelation to be something imparted from without.[324] In the theological sense, faith is faith in something which is given to us through teaching. It is a sort of deception when faith and revelation are spoken of and represented as if faith and revelation in the theological sense were here in question; for the sense in which they are used, and which may be termed philosophic, is quite a different one, however pious an air may be assumed in using the terms. This is Jacobi's standpoint, and whatever is by philosophers and theologians said against it, this teaching is eagerly accepted and disseminated. And nowhere

is there anything to be found but reflections originating from Jacobi, whereby immediate knowledge is opposed to philosophic knowledge and to reason; and people speak of reason, philosophy, &c., as a blind man speaks of colours. It is, indeed, allowed that a man cannot make shoes unless he is a shoemaker, even although he have the measure and foot, and also the hands. But when Philosophy is concerned, immediate knowledge signifies that every man as he walks and stands is a philosopher, that he can dogmatize as he chooses, and that he is completely acquainted with Philosophy.

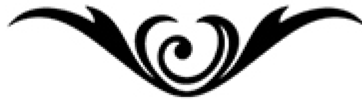
By reason, however, mediate knowledge merely is on the one hand understood, and on the other the intellectual perception which speaks of facts (*supra*, pp. 413-415). In this respect it is true that reason is the knowledge and revelation of absolute truth, since the understanding is the revelation of the finite (Jacobi's Werke, Vol. II. pp. 8-14, 101). "We maintained that two different powers of perception in man have to be accepted: a power of perception through visible and tangible and consequently corporeal organs of perception, and another kind of power, viz. through an invisible organ which in no way represents itself to the outward senses, and whose existence is made known to us through feeling alone. This organ, a spiritual eye for spiritual objects, has been called by men — generally speaking — reason. He whom the pure feelings of the beautiful and good, of admiration and love, of respect and awe, do not convince that in and with these feelings he perceives something to be present which is independent of them, and which is unattainable by the outward senses or by an understanding directed upon their perceptions alone — such an one cannot be argued with" (Jacobi's Werke, Vol. II. pp. 74, 76). But by faith Jacobi likewise understands all that has immediacy of Being for me: "Through faith we know that we have a body, we become aware of other actual things, and that indeed with the same certainty with

which we are aware of ourselves. We obtain all conceptions through the qualities which we receive and accept, and there is no other way of attaining real knowledge; for reason, when it begets objects, begets phantoms of the brain. Thus we have a revelation of nature."[325] Hence the expression faith, which had a deep significance in religion, is made use of for different contents of every kind; this in our own time is the point of view most commonly adopted.

Jacobi here brings faith into opposition with thought. Let us compare the two, and discover whether they are separated by so great a chasm as those who thus oppose them think. On the one hand absolute existence is to faith immediate; believing consciousness feels itself penetrated by this as by its essence: that existence is its life, believing consciousness asserts itself to be in direct unity with it. Thought thinks the absolute existence; such existence is to it absolute thought, absolute understanding, pure thought; but that signifies that it is likewise immediate itself. On the other hand to faith the immediacy of absolute existence has also the significance of a Being: it *is*, and is another than 'I.' And the same is true of the thinker; to him it is absolute Being, actual in itself, and different from self-consciousness or thought as finite understanding, to use the common term. Now what is the reason that faith and thought do not understand one another, and each recognize itself in the other? In the first place faith has no consciousness of being a thought, inasmuch as it asserts absolute consciousness to be identical with it as self-consciousness, and has direct inward knowledge of the same. But it expresses this simple unity; in its consciousness it is only immediacy so to speak in the signification of Being, a unity of its unconscious substance. In the second place Being-for-self is contained in thought; to this faith opposes the immediacy of Being. Thought, on the contrary, has the immediate as absolute potentiality, as absolutely a thing of thought: and the immediacy belonging to this thing of thought is without the

determination of Being, of life. On the heights of this abstraction the two stand opposed to each other, as the *Aufklärung* which asserts absolute existence to be a Beyond of self-consciousness, and as the materialism which makes it so to speak present matter (*supra*, pp. 382, 383). In the one case it is in faith and thought as positive existence or thought, and in the other it is the negative of self-consciousness, which is thus either only determined as negative, as a Beyond, or likewise as existent for self-consciousness. Hence faith and thought are both of them knowledge. We call universal knowledge thought, particular knowledge we call sensuous perception; and we term the introduction of external determinations understanding. The universal element in man is thought, but to it likewise appertains religious feeling for instance; the animal does not possess it, for it has no human feeling; and in so far as this feeling is religious, it is the feeling of a thinker, and what determines this feeling is not the determination of natural desire, &c., but a universal determination. Thus God, even though He is only felt and believed in, is yet the universal taken quite abstractly — even in His personality He is the absolutely universal personality.

As thought and faith are thus one, the same is true of the antithesis between mediated and immediate knowledge. We must, it is true, keep before our eyes the fact that what is revealed in immediate knowledge is the universal. But abstract immediate knowledge is natural, sensuous knowledge; the immediate man in his natural condition, in his desires, does not know this universal. Children, the Esquimaux, &c., know nothing of God; or what the natural man knows of Him is not a real knowledge of Him. Thus the intuitive knowledge of the Egyptians told them that God was an ox or a cat, and the Indians still possess similar sorts of knowledge. On the other hand when man has come so far as to know God as merely an object of the mind, *i.e.* as spiritual, it is easy to perceive that this knowledge



which is asserted to be immediate is really a result mediated through instruction, through a long continued culture. It is only by means of being elevated above nature that man arrives at a consciousness of what is higher, and at a knowledge of the universal; there indeed his knowledge is immediate, but he has only arrived at this through mediation. I think, and thus I know the universal immediately, but this very thought is just process in itself, movement and life. All life is process within itself, is mediated, and this is all the more true of spiritual life; for it is the passing from one to the other, that is, from the merely natural and sensuous to the spiritual. It thus indicates a deficiency in the most simple reflection not to know that the universal is not in immediate knowledge, but is a result of the culture, the education, and the self-revelation of the human race. If immediate knowledge is to be allowed, everyone will be responsible merely to himself: this man knows this, another that, and consequently everything is justified and approved, however contrary to right and religion. This opposition between immediacy and mediacy is thus a very barren and quite empty determination; it is a platitude of the extremest type to consider anything like this to be a true opposition; it proceeds from a most wooden understanding, which thinks that an immediacy can be something on its own account, without a mediation within itself. If Philosophy were to result in this it would be a poor affair; these determinations are merely forms, none of which has intrinsic truth. The form into which Philosophy has in Jacobi's case finally fallen, which is that immediacy is grasped as absolute, manifests a lack of all critical faculty, of all logic. The Kantian philosophy is critical philosophy, but from it the fact has been omitted that we cannot constitute the infinite with finite categories — and immediacy is such an one. When we regard this opposition more closely all knowledge may be termed immediate, but all immediate knowledge is likewise mediated in itself. This we know within our consciousness, and we may see it in the

most general phenomena. I know, for example, of America immediately, and yet this knowledge is very much mediated. If I stand in America and see its soil, I must first of all have journeyed to it, Columbus must first have discovered it, ships must have been built, &c.; all these discoveries and inventions pertain to it. That which we now know immediately is consequently a result of infinitely many mediations. Likewise when I see a right-angled triangle I know that the squares of the two sides are equal to the square of the hypotenuse: I know this immediately, and yet I have merely learned it and am convinced of it through the mediation of proof. Immediate knowledge is thus everywhere mediated, and Philosophy does nothing but bring this to consciousness — demonstrating the mediation which in point of fact is already present there, *e.g.* in religion, &c.

The philosophy of Jacobi, inasmuch as it says: "Thought cannot proceed further than to the feeling of God," has been accepted *utiliter*; it was more easily arrived at than in the case of Kant. Knowledge, however, is something very different from what Jacobi calls such; against finite knowledge his arguments are quite correct. Immediate knowledge is not knowledge, comprehension, for that implies that the content is determined in itself, *i.e.* is grasped as concrete. But in immediate knowledge it is the case that the only fact known of God is that He exists. For should there be determinations respecting God, they must, according to Jacobi, be grasped as a finite, and the knowledge of them would again merely be a progression from finite to finite. There thus remains only the indeterminate conception of God, an "Above me," an indeterminate Beyond. This gives accordingly the same result as does the *Aufklärung*, viz. that the highest reality is ultimate: we find the same in French philosophy and in Kant — only here we still have the opinion that this emptiness is the highest philosophy possible. But if each standpoint has an aspect wherein it is justified, there always rests in the proposition that the human mind knows God

immediately, the important consideration that we have here a recognition of the freedom of the human spirit: in it we have the source of the knowledge of God, and all externality of authority is thus abrogated in this principle. The principle is hereby gained, but only the principle of freedom of spirit; and the greatness of our time rests in the fact that freedom, the peculiar possession of mind whereby it is at home with itself in itself, is recognized, and that mind has this consciousness within itself. This however is merely abstract, for the next step is that the principle of freedom is again purified and comes to its true objectivity, so that not everything which strikes me or springs up within me must, because it is manifested in me, hold good as true. It is only through thought, which casts off the particular and accidental, that the principle receives this objectivity which is independent of mere subjectivity and in and for itself — though in such a way that the freedom of mind still remains respected. One's own spirit must bear witness to spirit that God is Spirit; the content must be true. But this does not give authenticity to itself by its being revealed with certainty to me. This is the standpoint, and we have thus seen its deficiency and the greatness of the principle which is involved in it.

B. Kant.

THE PHILOSOPHY OF Kant, which we have now more particularly to consider, made its appearance at the same time as the above. While Descartes asserted certainty to be the unity of thought and Being, we now have the consciousness of thought in its subjectivity, *i.e.* in the first place, as determinateness in contrast with objectivity, and then as finitude and progression in finite determinations. Abstract thought as personal conviction is that which is maintained as certain; its contents are experience, but the methods adopted by experience are once more formal thought and argument. Kant turns back to the standpoint of Socrates; we see in him the freedom of the subject as we saw it with the Stoics, but the task in respect of content is now placed on a higher level. An endless aiming at the concrete is required for thought, a filling up in accordance with the rule which completion prescribes, which signifies that the content is itself the Idea as the unity of the Notion and reality. With Jacobi thought, demonstration, does not in the first place reach beyond the finite and conditioned, and in the second place, even when God is likewise the metaphysical object, the demonstration is really the making Him conditioned and finite; in the third place the unconditioned, what is then immediately certain, only exists in faith, a subjectively fixed point of view but an unknowable one, that is to say an undetermined, indeterminable, and consequently an unfruitful one. The standpoint of the philosophy of Kant, on the contrary, is in the first place to be found in the fact that thought has through its reasoning got so far as to grasp itself not as contingent but rather as in itself the absolute ultimate. In the finite, in connection with the finite, an absolute standpoint is raised which acts as a connecting bond; it binds

together the finite and leads up to the infinite. Thought grasped itself as all in all, as absolute in judgment; for it nothing external is authoritative, since all authority can receive validity only through thought. This thought, determining itself within itself and concrete, is, however, in the second place, grasped as subjective, and this aspect of subjectivity is the form which from Jacobi's point of view is predominant; the fact that thought is concrete Jacobi has on the other hand for the most part set aside. Both standpoints remain philosophies of subjectivity; since thought is subjective, the capacity of knowing the absolute is denied to it. To Kant God cannot on the one hand be found in experience; He can neither be found in outward experience — as Lalande discovered when he swept the whole heavens and found no God — nor can He be discovered within; though no doubt mystics and enthusiasts can experience many things in themselves, and amongst these God, *i.e.* the Infinite. On the other hand Kant argues to prove the existence of God, who is to him an hypothesis necessary for the explanation of things, a postulate of practical reason. But in this connection another French astronomer made the following reply to the Emperor Napoleon: "*Je n'ai pas eu besoin de cette hypothèse.*" According to this the truth underlying the Kantian philosophy is the recognition of freedom. Even Rousseau represented the absolute to be found in freedom; Kant has the same principle, but taken rather from the theoretic side. The French regard it from the side of will, which is represented in their proverb: "*Il a la tête près du bonnet.*" France possesses the sense of actuality, of promptitude; because in that country conception passes more immediately into action, men have there applied themselves more practically to the affairs of actuality. But however much freedom may be in itself concrete, it was as undeveloped and in its abstraction that it was there applied to actuality; and to make abstractions hold good in actuality means to destroy actuality. The fanaticism which characterized the freedom which was put into the hands of

the people was frightful. In Germany the same principle asserted the rights of consciousness on its own account, but it has been worked out in a merely theoretic way. We have commotions of every kind within us and around us, but through them all the German head quietly keeps its nightcap on and silently carries on its operations beneath it.

Immanuel Kant was born at Königsberg in 1724, and there studied theology to begin with; in the year 1755 he entered upon his work as an academic teacher; in 1770 he became professor of logic, and in 1804 he died at Königsberg on the 12th of February, having almost attained his eightieth year (Tennemann's Grundriss der Geschichte der Philosophie by Wendt, § 380, pp. 465, 466), without ever having left his native town.

While to Wolff thought as thought was merely positive self-identity and grasped itself as such, we saw the negative self-moving thought, the absolute Notion, appear in all its power in France; and in the *Aufklärung* it likewise made its way to Germany in such a manner that all existence, all action, was called upon to serve a useful purpose, *i.e.* the implicit was done away with and everything had to be for another; and that for which everything had to be is man, self-consciousness, taken, however, as signifying all men generally. The consciousness of this action in abstract form is the Kantian philosophy. It is thus the self-thinking absolute Notion that passes into itself which we see making its appearance in Germany through this philosophy, in such a way that all reality falls within self-consciousness; it is the idealism which vindicates all moments of the implicit to self-consciousness, but which at first itself remains subject to a contradiction, inasmuch as it still separates this implicit from itself. In other words the Kantian philosophy no doubt leads reality back to self-consciousness, but it can supply no reality to this essence of self-consciousness, or to this pure self-consciousness, nor can it demonstrate Being in the same. It apprehends simple thought as having difference in

itself, but does not yet apprehend that all reality rests on this difference; it does not know how to obtain mastery over the individuality of self-consciousness, and although it describes reason very well, it does this in an unthinking empiric way which again robs it of the truth it has. Theoretically the Kantian philosophy is the "Illumination" or *Aufklärung* reduced to method; it states that nothing true can be known, but only the phenomenal; it leads knowledge into consciousness and self-consciousness, but from this standpoint maintains it to be a subjective and finite knowledge. Thus although it deals with the infinite Idea, expressing its formal categories and arriving at its concrete claims, it yet again denies this to be the truth, making it a simple subjective, because it has once for all accepted finite knowledge as the fixed and ultimate standpoint. This philosophy made an end of the metaphysic of the understanding as an objective dogmatism, but in fact it merely transformed it into a subjective dogmatism, *i.e.* into a consciousness in which these same finite determinations of the understanding persist, and the question of what is true in and for itself has been abandoned. Its study is made difficult by its diffuseness and prolixity, and by the peculiar terminology found in it. Nevertheless this diffuseness has one advantage, that inasmuch as the same thing is often repeated, the main points are kept before us, and these cannot easily be lost from view.

We shall endeavour to trace the lines which Kant pursued. The philosophy of Kant has in the first place a direct relation to that of Hume as stated above (p. 370). That is to say, the significance of the Kantian philosophy, generally expressed, is from the very beginning to allow that determinations such as those of universality and necessity are not to be met with in perception, and this Hume has already shown in relation to Locke. But while Hume attacks the universality and necessity of the categories generally, and Jacobi their finitude, Kant merely argues against their objectivity in so far as they are present in external things themselves, while

maintaining them to be objective in the sense of holding good as universal and necessary, as they do, for instance, in mathematics and natural science.[326] The fact that we crave for universality and necessity as that which first constitutes the objective, Kant thus undoubtedly allows. But if universality and necessity do not exist in external things, the question arises "Where are they to be found?" To this Kant, as against Hume, maintains that they must be *a priori*, *i.e.* that they must rest on reason itself, and on thought as self-conscious reason; their source is the subject, "I" in my self-consciousness.[327] This, simply expressed, is the main point in the Kantian philosophy.

In the second place the philosophy of Kant is likewise called a critical philosophy because its aim, says Kant, is first of all to supply a criticism of our faculties of knowledge; for before obtaining knowledge we must inquire into the faculties of knowledge. To the healthy human understanding that is plausible, and to it this has been a great discovery. Knowledge is thereby represented as an instrument, as a method and means whereby we endeavour to possess ourselves of the truth. Thus before men can make their way to the truth itself they must know the nature and function of their instrument. They must see whether it is capable of supplying what is demanded of it — of seizing upon the object; they must know what the alterations it makes in the object are, in order that these alterations may not be mixed up with the determinations of the object itself.[328] This would appear as though men could set forth upon the search for truth with spears and staves. And a further claim is made when it is said that we must know the faculty of knowledge before we can know. For to investigate the faculties of knowledge means to know them; but how we are to know without knowing, how we are to apprehend the truth before the truth, it is impossible to say. It is the old story of the σχολαστικός who would not go into the water till he could swim. Thus since the investigation of the

faculties of knowledge is itself knowing, it cannot in Kant attain to what it aims at because it is that already — it cannot come to itself because it is already with itself; the same thing happens as happened with the Jews, the Spirit passes through the midst of them and they know it not. At the same time the step taken by Kant is a great and important one — that is, the fact that he has made knowledge the subject of his consideration.

On the one hand this critique of knowledge applies to the empirical knowledge of Locke, which asserts itself to be grounded on experience, and, on the other hand, it also deals with what claims to be on the whole a more metaphysical kind of philosophy — the Wolffian and German — which had also taken up the line of proceeding on the more empiric method which has been depicted. But this last has at the same time kept itself separate from the merely empiric method, inasmuch as its main efforts have been directed towards making such categories of thought as those of potentiality, actuality, God, &c., have as their foundation categories of the understanding, and then reasoning from them. The Kantian philosophy is in the first instance directed against both. Kant takes away the objective significance of the determinations of the Wolffian metaphysics, and shows how they must be ascribed to subjective thought alone. At the same time Jacobi likewise declared himself against this metaphysic, but since he started more especially from the standpoint of the French and Germans, his point of view was different: he asserts that our finite thought can set forth finite determinations alone, and thus can only consider God and Spirit in accordance with finite relationships. On the practical side there reigned at that time the so-called happiness theory, since man's inherent Notion and the way to realize this Notion was apprehended in morality as a satisfaction of his desires. As against this Kant has very rightly shown that it involves a heteronomy and not an autonomy of reason — a determination through nature and consequently an absence of freedom. But because the rational

principle of Kant was formal, and his successors could not make any further progress with reason, and yet morality had to receive a content, Fries and others must still be called Hedonists though they avoid giving themselves the name.

In the third place, as regards the relation of the categories to the material which is given through experience, there is according to Kant already inherent in the subjective determinations of thought, *e.g.* in those of cause and effect, the capacity of themselves to bind together the differences which are present in that material. Kant considers thought as in great measure a synthetic activity, and hence he represents the main question of Philosophy to be this, "How are synthetic judgments *a priori* possible?"[329] Judgment signifies the combination of thought-determinations as subject and predicate. Synthetic judgments *a priori* are nothing else than a connection of opposites through themselves, or the absolute Notion, *i.e.* the relations of different determinations such as those of cause and effect, given not through experience but through thought. Space and time likewise form the connecting element; they are thus *a priori*, *i.e.* in self-consciousness. Since Kant shows that thought has synthetic judgments *a priori* which are not derived from perception, he shows that thought is so to speak concrete in itself. The idea which is present here is a great one, but, on the other hand, quite an ordinary signification is given it, for it is worked out from points of view which are inherently rude and empirical, and a scientific form is the last thing that can be claimed for it. In the presentation of it there is a lack of philosophical abstraction, and it is expressed in the most commonplace way; to say nothing more of the barbarous terminology, Kant remains restricted and confined by his psychological point of view and empirical methods.

To mention one example only of his barbarous expressions, Kant calls his philosophy (Kritik der reinen Vernunft, p. 19) a Transcendental

philosophy, *i.e.* a system of principles of pure reason which demonstrate the universal and necessary elements in the self-conscious understanding, without occupying themselves with objects or inquiring what universality and necessity are; this last would be transcendent. Transcendent and transcendental have accordingly to be clearly distinguished. Transcendent mathematics signifies the mathematics in which the determination of infinitude is made use of in a pre-eminent degree: in this sphere of mathematics we say, for instance, that the circle consists of an infinitude of straight lines; the periphery is represented as straight, and since the curve is represented as straight this passes beyond the geometric category and is consequently transcendent. Kant, on the contrary, defines the transcendental philosophy as not a philosophy which by means of categories passes beyond its own sphere, but one which points out in subjective thought, in consciousness, the sources of what may become transcendent. Thought would thus be transcendent if the categories of universality, of cause and effect, were predicated of the object, for in this way men would from the subjective element 'transcend' into another sphere. We are not justified in so doing as regards the result nor even to begin with, since we merely contemplate thought within thought itself. Thus we do not desire to consider the categories in their objective sense, but in so far as thought is the source of such synthetic relationships; the necessary and universal thus here receive the significance of resting in our faculties of knowledge. But from this faculty of knowledge Kant still separates the implicit, the thing-in-itself, so that the universality and necessity are all the time a subjective conditionment of knowledge merely, and reason with its universality and necessity does not attain to a knowledge of the truth.[330] For it requires perception and experience, a material empirically given in order, as subjectivity, to attain to knowledge. As Kant says, these form its "constituent parts"; one part it has in itself, but the other is empirically

given.[331] When reason desires to be independent, to exist in itself and to derive truth from itself, it becomes transcendent; it transcends experience because it lacks the other constituent, and then creates mere hallucinations of the brain. It is hence not constitutive in knowledge but only regulative; it is the unity and rule for the sensuous manifold. But this unity on its own account is the unconditioned, which, transcending experience, merely arrives at contradictions. In the practical sphere alone is reason constitutive. The critique of reason is consequently not the knowing of objects, but of knowledge and its principles, its range and limitations, so that it does not become transcendent.[332] This is an extremely general account of what we shall now consider in its separate details.

In dealing with this matter Kant adopts the plan of first considering theoretic reason, the knowledge which relates to outward objects. In the second place he investigates the will as self-actualization; and, in the third place, the faculty of judgment, the special consideration of the unity of the universal and individual; how far he gets in this matter we shall likewise see. But the critique of the faculty of knowledge is the matter of main importance.

1. In the first place, as to the theoretic philosophy, Kant in the Critique of Pure Reason sets to work in a psychological manner, *i.e.* historically, inasmuch as he describes the main stages in theoretic consciousness. The first faculty is sensuousness generally, the second understanding, the third reason. All this he simply narrates; he accepts it quite empirically, without developing it from the Notion or proceeding by necessity.

a. The *a priori* fact of sensuous existence, the forms of sensuous existence, constitute the beginning of this transcendentalism. Kant calls the judgment of the same the transcendental æsthetic. Nowadays æsthetic signifies the knowledge of the beautiful. But here the doctrine of intuition or perception is taken from the point of view of its universality, *i.e.* from

what in it pertains to the subject as such. Perception, says Kant, is the knowledge of an object given to us through the senses; sensuousness, however, is the capacity of being affected by conceptions as external. Now, according to Kant, in perception there are to be found all manner of contents, and in dealing with this he first of all distinguishes feeling as external, such as redness, colour, hardness, &c., and then as internal, such as justice, wrath, love, fear, pleasurable and religious feelings, &c. He says content such as this forms the one constituent and pertains to feeling; all this is subjective and merely subjective. In this sensuous element there is, however, a universal sensuous element likewise contained, which as such does not belong to feeling in so far as it is immediately determined; in such a content this 'other' consists in the categories of space and time, which of themselves are void and empty. The filling in is performed by the content, by colour, softness, hardness, &c., as regards space; while as regards time, the same content, so soon as it is something transient, or again some other content, and in particular inward feelings are what causes the determination. Space and time are consequently pure, *i.e.* abstract perceptions in which we place outside of us the content of individual sensations, either in time as succeeding one another, or in space as separate from one another. Here we thus meet with the division between subjectivity and objectivity, for if we isolate the 'alongside of' and 'after' we have space and time. It is the act of *a priori* sensuousness to project the content; the forms of intuition or perception constitute this pure perception.[333] Now everything indeed is termed perception, even thought and consciousness; God, who certainly pertains to thought alone, is said to be comprehended by perception or intuition, the so-called immediate consciousness.

Kant further remarks in this regard, (1) "Space is no empirical Notion which has been derived from outward experiences." But the Notion is never really anything empiric: it is in barbarous forms like this that Kant,

however, always expresses himself: “For in order that I may relate my sensations to something outside of me, I must presuppose space.” Of time Kant speaks in similar terms: “In order that something outside of me may be represented in separate space or time, the conception of space and time must come first, or it cannot be derived from experience, for experience first becomes possible through this antecedent conception.” That is to say, time and space which may appear as objective, since their particular filling in certainly belongs to subjective feeling, are not empirical; for consciousness has time and space first of all in itself. (2) “Space is a necessary conception which lies at the basis of all external perceptions. Space and time are conceptions *a priori*, because we cannot represent things without space and time. Time is a necessary basis for all phenomena.” As *a priori*, space and time are universal and necessary, that is to say we find this to be the case; but it does not follow that they must be previously present as conceptions. They are fundamental indeed, but they are likewise an external universal. Kant however places the matter somewhat in this fashion: there are things-in-themselves outside, but devoid of time and space; consciousness now comes, and it has time and space beforehand present in it as the possibility of experience, just as in order to eat it has mouth and teeth, &c., as conditions necessary for eating. The things which are eaten have not the mouth and teeth, and as eating is brought to bear on things, so space and time are also brought to bear on them; just as things are placed in the mouth and between the teeth, so is it with space and time. (3) “Space and time are not general Notions of the relations of things, but pure intuitive perceptions. For we can only represent to ourselves one space; there are not different component parts of space.” The same is the case with time. The abstract conception tree, for example, is in its actuality a number of individual and separate trees, but spaces are not such particulars, nor are they parts; for one immediate continuity remains, and hence a simple unity.

Ordinary perception has always something individual before it; space or time are always however one only, and therefore *a priori*. It might however be replied to Kant: The nature of space and time undoubtedly involves their being an abstract universal; but there is in like manner only one blue. (4) "Each Notion or conception certainly comprises an infinite number of conceptions under itself, but not within itself; nevertheless this last is the case in space and time, and they are therefore intuitive perceptions and not Notions or conceptions."[334] Space and time, then, are certainly not thought-determinations, if no thoughts are there present, but a Notion, so soon as we have a Notion of them.

From the transcendental point of view it is likewise maintained that this conception of space and time contains synthetic propositions *a priori*, connected with the consciousness of its necessity. Examples of these synthetic propositions are sought in statements such as that of space having three dimensions, or in the definition of a straight line, that it is the shortest distance between two points, and likewise in the statement that 5 + 7 = 12.[335] All these propositions are however very analytic. Kant nevertheless in the first place holds that such propositions do not take their rise from experience, or, as we might better express it, are not an individual contingent perception; this is very true, the perception is universal and necessary. In the second place he states that we acquire them from pure sensuous perception, and not through the understanding or Notion. But Kant does not grasp the two together, and yet this comprehension of them is involved in such propositions being immediately certain even in ordinary perception. When Kant then expresses himself (Kritik der reinen Vernunft, p. 49) to the effect that we have many sensations which constitute "the real matter," with which we externally and inwardly "occupy our minds," and that the mind has in itself in space and time "formal conditions of the mode in which we place them" (those manifold feelings) "in our mind," the

question of how mind arrives at having just these special forms now forces itself upon us. But what the nature of time and space is, it does not occur to the Kantian philosophy to inquire. To it what space and time are in themselves does not signify 'What is their Notion,' but 'Are they external things or something in the mind?'

b. The second faculty, the understanding, is something very different from sensuousness; the latter is Receptivity, while Kant calls thought in general Spontaneity — an expression which belongs to the philosophy of Leibnitz. The understanding is active thought, I myself; it "is the faculty of thinking the object of sensuous perception." Yet it has thoughts merely without real content: "Thoughts without content are void and empty, sensuous perceptions without Notions are blind." The understanding thus obtains from the sensuous its matter, both empirical and *a priori*, time and space; and it thinks this matter, but its thoughts are very different from this matter. Or it is a faculty of a particular kind, and it is only when both occur, when the sensuous faculty has supplied material and the understanding has united to this its thoughts, that knowledge results.[336] The thoughts of the understanding as such are thus limited thoughts, thoughts of the finite only.

Now logic, as transcendental logic, likewise sets forth the conceptions which the understanding has *a priori* in itself and "whereby it thinks objects completely *a priori*." Thoughts have a form which signifies their being the synthetic function which brings the manifold into a unity. *I* am this unity, the transcendental apperception, the pure apperception of self-consciousness. I = I; *I* must 'accompany' all our conceptions.[337] This is a barbarous exposition of the matter. As self-consciousness I am the completely void, general I, completely indeterminate and abstract; apperception is determination generally, the activity whereby I transplant an empirical content into my simple consciousness, while perception rather signifies feeling or conceiving. In order that a content may enter this One, it

must be infected by its simplicity; it is thus that the content first becomes my content. The comprehending medium is 'I'; whatever I have to do with must allow itself to be forced into these forms of unity. This is a great fact, an important item of knowledge; what thought produces is unity; thus it produces itself, for it is the One. Yet the fact that I am the one and, as thinking, the simplifier, is not by Kant satisfactorily set forth. The unity may likewise be called relation; for in so far as a manifold is presupposed, and as this on the one side remains a manifold while on the other side it is set forth as one, so far may it be said to be related.

Now as 'I' is the universal transcendental unity of self-consciousness which binds together the empirical matter of conception generally, there are various modes in this relationship, and here we have the transcendental nature of the categories or universal thought-determinations. But Kant (Kritik der reinen Vernunft, pp. 70, 77) approaches these modes of simplicity by accepting them as they are classified in ordinary logic. For he says that in common logic particular kinds of judgment are brought forward; and since judgment is a special kind of relationship of the manifold, the various functions of thought which 'I' has in it are shown therein. But the following kinds of judgment have been noticed, viz. Universal, Particular and Singular; Affirmative, Negative, Infinite; Categorical, Hypothetical, Disjunctive; Assertoric, Problematic and Apodictic judgments. These particular modes of relationship now brought forward are the pure forms of the understanding. There are thus, according to Kant (Kritik der reinen Vernunft, pp. 75, 76, 78-82), twelve fundamental categories, which fall into four classes; and it is noteworthy, and deserves to be recognized, that each species of judgment again constitutes a triad. (1) The first kind of categories are those of Quantity, viz. Unity, Plurality and Totality. Plurality is negation of the one, the assertion of difference; and the third, the bringing of the other two into one, plurality circumscribed, the

indeterminate plurality comprehended as one, is the Totality. (2) In the second series are the categories of Quality: Reality, Negation, Limitation. Limitation is as real or positive as negation. (3) The third series comprises the categories of relation, of connection; and first of all, indeed, the relation of Substantiality, Substance and Accident: then the relation of Causality, the relation of Cause and Effect, and finally Reciprocity. (4) The categories of Modality, of the relation of the objective to our thought, come fourth, viz. Possibility, Existence (actuality) and Necessity. Possibility should come second; in abstract thought, however, the empty conception comes first. It betrays a great instinct for the Notion when Kant says that the first category is positive, the second the negative of the first, the third the synthesis of the two. The triplicity, this ancient form of the Pythagoreans, Neo-Platonists and of the Christian religion, although it here reappears as a quite external *schema* only, conceals within itself the absolute form, the Notion. But since Kant says that a conception can determine itself in me as accidental, as cause, effect, unity, plurality, &c., we thereby have the whole of the metaphysics of the understanding. Kant does not follow up further the derivation of these categories, and he finds them imperfect, but he says that the others are derived from them. Kant thus accepts the categories in an empiric way, without thinking of developing of necessity these differences from unity. Just as little did Kant attempt to deduce time and space, for he accepted them likewise from experience — a quite unphilosophic and unjustifiable procedure.

Thinking understanding is thus indeed the source of the individual categories, but because on their own account they are void and empty, they only have significance through their union with the given, manifold material of perception, feeling, &c. Such connection of sensuous material with categories now constitutes the facts of experience, *i.e.* the matter of sensation after it is brought under the categories; and this is knowledge

generally.[338] The matter of perception which pertains to the feelings or sensuous perception is not left in the determination of individuality and immediacy, but I am active in relation to it, inasmuch as I bring it into connection through the categories and elevate it into universal species, natural laws, &c. The question of whether a completed sensuousness or the Notion is the higher may accordingly be easily decided. For the laws of the heavens are not immediately perceived, but merely the change in position on the part of the stars. It is only when this object of immediate perception is laid hold of and brought under universal thought-determinations that experience arises therefrom, which has a claim to validity for all time. The category which brings the unity of thought into the content of feeling is thus the objective element in experience, which receives thereby universality and necessity, while that which is perceived is rather the subjective and contingent. Our finding both these elements in experience demonstrates indeed that a correct analysis has been made. Kant (Kritik der reinen Vernunft, pp. 119, 120) however connects with this the statement that experience grasps phenomena only, and that by means of the knowledge which we obtain through, experience we do not know things as they are in themselves, but only as they are in the form of laws of perception and sensuousness. For the first component part of experience, sensation, is doubtless subjective, since it is connected with our organs. The matter of perception is only what it is in my sensation. I know of this sensation only and not of the thing. But, in the second place, the objective, which ought to constitute the opposite to this subjective side, is itself subjective likewise: it does not indeed pertain to my feeling, but it remains shut up in the region of my self-consciousness; the categories are only determinations of our thinking understanding. Neither the one nor the other is consequently anything in itself, nor are both together, knowledge, anything in itself, for it only knows phenomena — a strange contradiction.

The transition of the category to the empiric is made in the following way: "Pure conceptions of the understanding are quite of a different nature from empiric, indeed from any sensuous perceptions;" we have thus "to show how pure conceptions of the understanding can be applied to phenomena." This is dealt with by the transcendental faculty of judgment. For Kant says that in the mind, in self-consciousness, there are pure conceptions of the understanding and pure sensuous perceptions; now it is the schematism of the pure understanding, the transcendental faculty of the imagination, which determines the pure sensuous perception in conformity with the category and thus constitutes the transition to experience.[339] The connection of these two is again one of the most attractive sides of the Kantian philosophy, whereby pure sensuousness and pure understanding, which were formerly expressed as absolute opposites, are now united. There is thus here present a perceptive understanding or an understanding perception; but Kant does not see this, he does not bring these thoughts together: he does not grasp the fact that he has here brought both sides of knowledge into one, and has thereby expressed their implicitude. Knowledge itself is in fact the unity and truth of both moments; but with Kant the thinking understanding and sensuousness are both something particular, and they are only united in an external, superficial way, just as a piece of wood and a leg might be bound together by a cord. Thus, for example, the conception of substance in the *schema* becomes permanent in time,[340] *i.e.* the pure conception of the understanding, the pure category, is brought into unity with the form of pure sensuous perception.

In as far as we have to deal with our own determinations only and as we do not reach the implicit, the true objective, the Kantian philosophy called itself Idealism. But in this connection Kant (Kritik der reinen Vernunft, pp. 200, 201) brings forward a refutation of empirical or material idealism, thus: "I am conscious of my existence as determined in time. But all time-

determination presupposes something permanent in perception. This permanence cannot be" a sensuous perception "in me." For all the determining grounds of my existence which are met with in me are conceptions, and as such themselves require a constant element different from them, and in relation to which the change taking place in them — consequently "my existence in time," in which they change, "may be determined." Or I am conscious of my existence as of an empirical consciousness which is only capable of being determined in relation to something which is outside of me; *i.e.* I am conscious of something external to me. Conversely it may be said: I am conscious of external things as determined in time and as changing; these hence presuppose something constant which is not in them but outside of them. And this is 'I,' the transcendental ground of their universality and necessity, of their implicitude, the unity of self-consciousness. On another occasion Kant regards it thus (Kritik der reinen Vernunft, p. 101): These moments confuse themselves, because the constant element is itself a category. Idealism, when we regard it as signifying that nothing exists outside of my individual self-consciousness as individual, as also the refutation of this, the assertion that things exist outside of my self-consciousness as individual, are the one as bad as the other. The former is the idealism of Berkeley, in which self-consciousness as individual is alone in question, or the world of self-consciousness appears as a number of limited, sensuous, individual conceptions, which are as completely devoid of truth as though they were called things. The truth or untruth does not rest in their being things or conceptions, but in their limitation and contingency, whether as conceptions or things. The refutation of this idealism is nothing more than calling attention to the fact that this empirical consciousness does not exist in itself — just as those empiric things do not exist in themselves. But the knowing subject does not with Kant really arrive at reason, for it remains still the

individual self-consciousness as such, which is opposed to the universal. As a matter of fact there is described in what we have seen only the empirical finite self-consciousness which requires a material from outside, or which is limited. We do not ask whether these facts of knowledge are in and for themselves true or untrue; the whole of knowledge remains within subjectivity, and on the other side there is the thing-in-itself as an external. This subjectivity is however concrete in itself; even the determinate categories of the thinking understanding are concrete, and much more is experience so — the synthesis of the sensation and the category.[341]

c. The third faculty Kant finds in reason, to which he advances from the understanding after the same psychological method; that is to say, he hunts through the soul's sack to see what faculties are still to be found there; and thus by merest chance he lights on Reason. It would make no difference if there had been no Reason there, just as with physicists it is a matter of perfect indifference whether, for instance, there is such a thing as magnetism or not. "All our knowledge begins from the senses, thence proceeds to the understanding, and finishes up with reason; nothing higher than this is to be found in us, for it signifies the working up of the material of perception, and the reducing of it to the highest unity of thought." Reason is therefore, according to Kant, the power of obtaining knowledge from principles, that is, the power of knowing the particular in the universal by means of Notions; the understanding, on the contrary, reaches its particular by means of perception. But the categories are themselves particular. The principle of reason, according to Kant, is really the universal, inasmuch as it finds the unconditioned involved in the conditioned knowledge of the understanding. Understanding is hence for him thought in finite relations; reason, on the contrary, is thought which makes the unconditioned its object. Since Kant's time it has become customary in the language of philosophy to distinguish understanding and

reason, while by earlier philosophers this distinction was not drawn. The product of reason is, according to Kant, the Idea — a Platonic expression — and he understands by it the unconditioned, the infinite.[342] It is a great step forward to say that reason brings forth Ideas; with Kant, however, the Idea is merely the abstract universal, the indeterminate.

This, the unconditioned, must now be grasped as concrete, and therein lies the main difficulty. For to know the unconditioned means to determine it and to deduce its determinations. Much has been written and said on the subject of knowledge, without a definition of it ever having been offered. But it is the business of Philosophy to see that what is taken for granted as known is really known. Now on this point Kant says that reason has certainly the desire to know the infinite, but has not the power. And the reason which Kant gives for this (Kritik der reinen Vernunft, pp. 277, 278), is on the one hand that no psychologically sensuous intuition or perception corresponds with the infinite, that it is not given in outward or inward experience; to the Idea "no congruent or corresponding object can be discovered in the sensuous world." It depends, however, on how the world is looked at; but experience and observation of the world mean nothing else for Kant than a candlestick standing here, and a snuff-box standing there. It is certainly correct to say that the infinite is not given in the world of sensuous perception; and supposing that what we know is experience, a synthesis of what is thought and what is felt, the infinite can certainly not be known in the sense that we have a sensuous perception of it. But no one wishes to demand a sensuous proof in verification of the infinite; spirit is for spirit alone. The second reason for considering that the infinite cannot be known, lies in this, that Reason has no part in it except as supplying the forms of thought which we call categories; and these doubtless afford what Kant calls objective determinations, but in such a way that in themselves they are still only subjective. If therefore for the determination of the

infinite we employ these categories which are applicable only to phenomena, we entangle ourselves in false arguments (paralogisms) and in contradictions (antinomies); and it is an important point in the Kantian philosophy that the infinite, so far as it is defined by means of categories, loses itself in contradictions. Although reason, says Kant, becomes transcendent by the exhibition of these contradictions, it still retains its claim to trace perception, experience, and knowledge pertaining to the understanding, back to the infinite. This union of the infinite, the unconditioned, with the finite and conditioned as existing in the knowledge given by the understanding, or even in perception, would signify that the acme of concreteness had been reached.

Of this Unconditioned there are several kinds, objects having special features of their own and proceeding from reason, transcendental Ideas; they are thus themselves particular in their nature. The manner in which Kant arrives at these Ideas is again derived from experience, from formal logic, according to which there are various forms of the syllogism. Because, says Kant, there are three forms of the syllogism, categorical, hypothetical, and disjunctive, the Unconditioned is also three-fold in its nature: "Firstly, an Unconditioned of the categorical synthesis in a subject." Synthesis is the concrete; but the expression is ambiguous, since it indicates an external association of independent elements. "In the second place, an Unconditioned of the hypothetical synthesis of the members of a series will have to be looked for; and in the third place, an Unconditioned of the disjunctive synthesis of the parts in a system." We make the first connection, expressed as object of Reason or transcendental Idea, when we conceive "the thinking subject;" the second "is the sum total of all phenomena, the world;" and the third is "the thing which contains the supreme condition of the possibility of all that can be thought, the Being of all Beings," *i.e.* God. When brought to an ultimate point, the question which

meets us is whether Reason can bring these objects to reality, or whether they remain confined to subjective thought. Now, according to Kant, Reason is not capable of procuring reality for its Ideas — otherwise it would be transcendent, its limits would be overstepped; it produces only paralogisms, antinomies, and an ideal without reality.[343]

α. “A. paralogism is a syllogism false in its form.” Since Reason credits with reality that mode of the Unconditioned which constitutes the categorical synthesis in a subject, and therefore the thinking subject, it is termed substance. Now is the thinking ego a substance, a soul, a soul-thing? Further questions are whether it is permanent, immaterial, incorruptible, personal and immortal, and such as to have a real community with the body. The falsity of the syllogism consists in this, that the idea of the unity of the transcendental subject essential to Reason is expressed as a thing; for it is only in this way that the permanency of the same becomes substance. Otherwise I find myself permanent in my thought, of course, but only within perceiving consciousness, not outside of that. The ego is therefore the empty, transcendental subject of our thoughts, that moreover becomes known only through its thoughts; but of what it is in itself we cannot gather the least idea. (A horrible distinction! For thought is nothing more or less than the “in-itself” or implicit.) We cannot assert of it any present Being, because thought is an empty form, we have a conception of what thinking Beings are through no outward experience, but only by means of self-consciousness, — *i.e.* because we cannot take the “I” in our hands, nor see it, nor smell it. We therefore know very well that the ego is a subject, but if we pass beyond self-consciousness, and say that it is substance, we go farther than we are entitled to do. I cannot therefore assign any reality to the subject.[344]

We here see Kant fall into contradiction, what with the barbarity of the conceptions which he refutes, and the barbarity of his own conceptions

which remain behind when the others are refuted. In the first place, he is perfectly correct when he maintains that the ego is not a soul-thing, a dead permanency which has a sensuous present existence; indeed, were it to be an ordinary thing, it would be necessary that it should be capable of being experienced. But, in the second place, Kant does not assert the contrary of this, namely that the ego, as this universal or as self-thinking, has in itself the true reality which he requires as an objective mode. For he does not get clear of the conception of reality in which reality consists in the possession of a sensuous present existence; accordingly, because the ego is given in no outward experience, it is not real. For self-consciousness, the ego as such, is not, according to Kant, reality; it is only *our* thought, or in other words he regards self-consciousness as being itself simply and entirely sensuous. The form which Kant accordingly bestows on Being, thing, substance, would seem to indicate that these categories of the understanding were too high for the subject, too high to be capable of being predicated of it. But really such determinations are too poor and too mean, for what possesses life is not a thing, nor can the soul, the spirit, the ego, be called a thing. Being is the least or lowest quality that one can assign to spirit, its abstract, immediate identity with itself; Being thus no doubt pertains to spirit, but it must be considered as a determination scarcely worth applying to it.

β. In the second place we have the antinomy, *i.e.* the contradiction in Reason's Idea of the Unconditioned, an Idea applied to the world in order to represent it as a complete summing-up of conditions. That is to say, in the given phenomena Reason demands the absolute completeness of the conditions of their possibility, so far as these constitute a series, so that the unconditioned is contained in the world, *i.e.* the totality of the series. If now this completeness is expressed as existing, an antinomy is alone presented, and Reason is presented only as dialectic: *i.e.* in this object there is on every side a perfect contradiction found.[345] For phenomena are a finite content,

and the world is a conjunction of the limited; if this content is now thought by Reason, and therefore subsumed under the unconditioned and the unlimited, we have two determinations, finite and infinite, which contradict each other. Reason demands a perfectly complete synthesis, an absolute beginning; but in phenomena we have, on the contrary, a succession of causes and effects, which never come to an end. Kant here points out four contradictions (Kritik der reinen Vernunft, p. 320), which, however, is not enough; for in each Notion there are antinomies, since it is not simple but concrete, and therefore contains different determinations, which are direct opposites.

αα. These antinomies in the first place involve our making the one determination, limitation, just as valid as non-limitation. "Thesis: The world has a beginning and an end in time, and it is limited in regard to space. Antithesis: It has no beginning and no end in time, and also no limits in space." The one, says Kant, can be proved just as easily as the other; and indeed he does prove each indirectly, though his are not "advocate's proofs."[346] The world, as the universe, is the whole; it is thus a universal idea, and therefore unlimited. The completion of the synthesis in progression as regards time and space is, however, a first beginning of time and space. If therefore the categories of limited and unlimited are applied to the world in order to attain to a knowledge of it, we fall into contradictions, because the categories are not applicable to things-in-themselves.

ββ. The second antinomy is that atoms, from which substance is composed, must necessarily be admitted to exist, therefore simplicity can be proved; but just as easy is it to prove incompleteness, the endless process of division. The thesis is accordingly stated thus: "Every compound substance consists of simple parts," and the antithesis is as follows: "There exists nothing simple."[347] The one is here the limit, a material self-existence, the

point which is likewise the enclosing surface; the other is divisibility *ad infinitum*.

γγ. The third antinomy is the opposition between freedom and necessity. The first is the self-determining, the point of view pertaining to infinity: causality according to the laws of freedom is the only causality. The other is: Determinism alone is to be found: everything is determined by means of an external ground or reason.[348]

δδ. The fourth antinomy rests on what follows: On the one hand totality completes itself in freedom as a first beginning of action, or in an absolutely necessary Being, as the cause of the world, so that the process is interrupted: but there is opposed to that freedom the necessity of a process according to conditions of causes and effects, and to the necessity of a Being is opposed the consideration that everything is contingent. The absolute necessity of the conditioned world is therefore on the one hand maintained thus: "To the world belongs an absolutely necessary Being." The opposite to this is, "There exists no absolutely necessary Being, either as part of the world or outside of the world."[349]

One of these opposites is just as necessary as the other, and it is superfluous to carry this further here. The necessity of these contradictions is the interesting fact which Kant (Kritik der reinen Vernunft, p. 324) has brought to consciousness; in ordinary metaphysics, however, it is imagined that one of these contradictions must hold good, and the other be disproved. The most important point involved in this assertion of Kant's is, however, unintentional on his part. For he indeed solves these antinomies (Kritik der reinen Vernunft, pp. 385, 386), but only in the particular sense of transcendental idealism, which does not doubt or deny the existence of external things (*supra*, p. 442), but "allows that things are perceived in space and time" (which is the case, whether it allows it or not): for

transcendental idealism, however, “space and time in themselves are not things at all,” and therefore “do not exist apart from our mind;” *i.e.* all these determinations of a beginning in time, and so on, do not really belong to things, to the implicitude of the phenomenal world, which has independent existence outside of our subjective thought. If such determinations belonged to the world, to God, to free agents, there would be an objective contradiction; but this contradiction is not found as absolute, it pertains only to us. Or, in other words, this transcendental idealism lets the contradiction remain, only it is not Being in itself that is thus contradictory, for the contradiction has its source in our thought alone. Thus the same antinomy remains in our mind; and as it was formerly God who had to take upon Himself all contradictions, so now it is self-consciousness. But the Kantian philosophy does not go on to grapple with the fact that it is not things that are contradictory, but self-consciousness itself. Experience teaches that the ego does not melt away by reason of these contradictions, but continues to exist; we need not therefore trouble ourselves about its contradictions, for it can bear them. Nevertheless Kant shows here too much tenderness for things: it would be a pity, he thinks, if they contradicted themselves. But that mind, which is far higher, should be a contradiction — that is not a pity at all. The contradiction is therefore by no means solved by Kant; and since mind takes it upon itself, and contradiction is self-destructive, mind is in itself all derangement and disorder. The true solution would be found in the statement that the categories have no truth in themselves, and the Unconditioned of Reason just as little, but that it lies in the unity of both as concrete, and in that alone.

γ. Kant now goes on to the Idea of God; this third idea is the Being of Beings, which the other ideas presupposed. Kant says (Kritik der reinen Vernunft, pp. 441-452), that according to the definition of Wolff, God is the most real of all Beings; the object then comes to be to prove that God is not

only Thought, but that He is, that He has reality, Being. This Kant calls the Ideal of Reason, to distinguish it from the Idea, which is only the sum of all possibility. The Ideal is thus the Idea as existent; just as in art we give the name of ideal to the Idea realized in a sensuous manner. Here Kant takes into consideration the proof of the existence of God, as he asks whether reality can be assigned to this Ideal.

The ontological proof proceeds from the absolute Notion, in order from it to argue up to Being. With Anselm, Descartes, and Spinoza the transition to Being is thus made; and all of them assume in so doing the unity of Being and thought. But Kant says (Kritik der reinen Vernunft, pp. 458-466): To this Ideal of Reason just as little reality can be assigned: there is no transition from the Notion to Being. "Being is not a real predicate," like any other, "a Notion of something which might be added to the Notion of a thing. A hundred real dollars do not contain in the very least more than a hundred possible dollars," they are the same content, *i.e.* the same Notion; they are also a hundred exactly. The one is the Notion, or rather the conception, the other is the object; Being is no new determination of the Notion, otherwise my Notion of a hundred real dollars would contain something different from a hundred real dollars. But "the object, as real, is not contained in my Notion alone; or to my Notion the real hundred dollars are synthetically added." Being cannot therefore be derived from the Notion, because it is not contained therein, but must be added to it. "We must go out of the Notion in order to arrive at existence. With regard to objects of pure thought, there are no means of coming to know of their existence, because it had to be known *a priori*; but our consciousness of all existence belongs entirely to experience." That is to say, Kant does not attain to the comprehension of that very synthesis of Notion and Being, or in other words, he does not comprehend existence, *i.e.* he does not attain to the establishment of it as Notion; existence remains for him something

absolutely different from a Notion. The content is no doubt the same for him in what exists and in the Notion: but since Being is not involved in the Notion, the attempt to derive the one from the other is unavailing.

Of course the determination of Being is not found as positive and ready-made in the Notion; the Notion is something different from reality and objectivity. If we therefore abide by the Notion, we abide by Being as something different from the Notion, and adhere to the separation of the two; we then have conception, and not Being at all. That a hundred possible dollars are something different from a hundred actual ones is a reflection of a very popular nature, so much so that no proposition has been so well received as the assertion that no transition can be made from the Notion to Being; for though I imagine to myself a hundred dollars, I do not possess them for all that. But in a like popular fashion it might be said that one must leave off imagining, for that is mere conception: *i.e.* what is merely imaginary is untrue, the hundred imaginary dollars are and remain imaginary. Therefore to believe in them is a proof of an unsound understanding, and is of no manner of use; and he is a foolish fellow who indulges in such fancies and wishes. One possesses a hundred dollars, when they are real only; if a man has therefore so great a desire to possess a hundred dollars, he must put his hand to work in order to obtain them: *i.e.* he must not come to a standstill at the imagination of them, but pass out beyond it. This subjective side is not the ultimate or the absolute; the true is that which is not merely subjective. If I possess a hundred dollars, I have them actually, and at the same time I form a conception of them to myself. But according to Kant's representation we come to a deadlock at the difference; dualism is ultimate, and each side has independent validity as an absolute. Against this false idea of what is to be absolute and ultimate, the healthy human understanding is directed; every ordinary consciousness rises above it, every action aims at setting aside a subjective conception and

making it into something objective. There is no man so foolish as that philosophy; when a man feels hungry, he does not call up the imagination of food, but sets about satisfying his hunger. All activity is a conception which does not yet exist, but whose subjectivity is abrogated. Moreover the imaginary hundred dollars become real, and the real ones imaginary: this is a frequent experience, this is their fate; it depends on circumstances entirely outward whether a hundred dollars become my property or not. Of course the mere conception is of no good, if I obstinately hold by it: for I can imagine what I will, but that does not make it exist. The only important point is what I conceive to myself, and then whether I think or comprehend the subjective and Being; by means of this each passes into the other. Thought, the Notion, of necessity implies that the Notion does not remain subjective; this subjective is on the contrary abrogated and reveals itself as objective. Now that unity is expressly affirmed by Descartes solely in reference to the Notion of God, for it is just that which is God; he speaks of no hundred dollars, as these are not an existence which has a Notion in itself. That opposition does away with itself absolutely and entirely, *i.e.* the finite passes away; it holds good only in the philosophy of finitude. If, therefore, there is not a Notion of existence formed, we have in it a notionless, sensuous object of perception; and what is notionless is certainly not a Notion, — therefore sensation, handling, are not Notions. Such existence has of course no Absolute, no real essence: or such existence has no truth, it is only a vanishing moment. This useless thrashing of the empty grainless straw of the common logic is termed philosophizing: it is like Issachar the strong ass, which could not be made to move from the spot where it was (Gen. xlix. 14). People of this kind say: We are good for nothing, and because we are good for nothing, we are good for nothing, and wish to be good for nothing. But it is a very false idea of Christian humility and modesty to desire through one's abjectness to attain to excellence; this

confession of one's own nothingness is really inward pride and great self-conceit. But for the honour of true humility we must not remain in our misery, but raise ourselves above it by laying hold of the Divine.

The fact to which Kant clings most strongly (Kritik der reinen Vernunft, p. 467) is this, that Being cannot be extracted from the Notion. The result of this is the proposition that to have the thought of the Infinite is certainly Reason; but that from the Idea of Reason is separated determination in general, and especially the determination which is known as Being. The Ideas of Reason cannot be proved from experience, or obtain from it their verification: if they are defined by means of categories, contradictions arise. If the Idea in general is to be defined as existent only, it is nothing more or less than the Notion; and the Being of the existent is still distinguished from it. This result, however, so highly important with reference to knowledge of the understanding, Kant does not, with reference to Reason, carry further than to say that Reason has on its own account nothing but formal unity for the methodical systematization of the knowledge of the understanding. Abstract thinking is adhered to; it is said that the understanding can only bring about order in things; but order is nothing in and for itself, it is only subjective. There therefore remains nothing for Reason except the form of its pure identity with itself, and this extends no further than to the arranging of the manifold laws and relations of the understanding, the classes, kinds and species which the understanding discovers.[350] I, as Reason or conception, and the things external to me, are both absolutely different from one another; and that, according to Kant, is the ultimate standpoint. The animal does not stop at this standpoint, but practically brings about unity. This is the critique of theoretical Reason which Kant gives, and in which he states the *a priori* and determinate character of Reason in itself, without bringing it to the determinateness of individuality.[351]

Mention should still be made of the positive philosophy or metaphysics, which Kant sets *a priori* above objective existence, the content of the object of experience, nature; we have here his natural philosophy, which is a demonstration of the universal conceptions of Nature. But this is on the one hand very scanty and restricted in content, containing as it does sundry general qualities and conceptions of matter and motion, and with regard to the scientific side or the *a priori*, as Kant calls it, it is likewise altogether unsatisfactory. For Kant assumes all such conceptions as that matter has motion and also a power of attraction and repulsion,[352] instead of demonstrating their necessity. The "Principles of Natural Philosophy" have nevertheless been of great service, inasmuch as at the commencement of a philosophy of nature, attention was called to the fact that physical science employs thought-determinations without further investigation; and these determinations constitute the real foundations of its objects. Density, for instance, is looked on by physical science as a variable quantity, as a mere *quantum* in space: instead of this Kant asserted it to be a certain degree of occupation of space, *i.e.* energy, intensity of action. He demands accordingly (Metaphysische Anfangsgründe der Naturwissenschaft, pp. 65-68) a construction of matter from powers and activities, not from atoms; and Schelling still holds to this without getting further. Kant's work is an attempt to think, *i.e.* to demonstrate the determinations of thought, whose product consists of such conceptions as matter; he has attempted to determine the fundamental Notions and principles of this science, and has given the first impulse to a so-called dynamic theory of Nature.

"Religion within pure Reason" is also a demonstration of dogmas as aspects of Reason, just as in Nature. Thus in the positive dogmas of religion, which the Aufklärung (the clearing-up) — or the Ausklärung (the clearing-out) — made short work of, Kant called to remembrance Ideas of Reason, asking what rational and, first of all, what moral meaning lies in

that which men call dogmas of religion, *e.g.* original sin.[353] He is much more reasonable than the *Ausklärung*, which thinks it beneath its dignity to speak of such matters. These are the principal points in respect to the theoretical part of Kant's philosophy.

2. The second subject of review in Kant's philosophy is the practical sphere, the nature and principle of the will; this subject is dealt with in the Critique of Practical Reason, in which Kant accepted Rousseau's conclusion that the will is absolutely free. Kant's idea of theoretic Reason is that when Reason relates itself to an object, this object must be given to it; but when the object is given by Reason to itself, it has no truth; and Reason in knowledge of this kind does not arrive at independence. As practical, on the contrary, Reason is independent in itself; as a moral Being man is free, raised above all natural law and above all phenomena. As the theoretic Reason had in itself categories, *a priori* distinctions, so practical Reason has in turn the moral law in general, the further determinations of which are constituted by the notions of duty and right, lawful and unlawful; and here Reason disdains all the given material which was necessary to it on the theoretic side. The will determines itself within itself; all that is right and moral rests on freedom; in this man has his absolute self-consciousness.[354] On this side self-consciousness finds essential reality in itself, as theoretical Reason found it in an "other"; and in the first place, indeed, the ego in its individuality is immediate reality, universality, objectivity; in the second place subjectivity strives after reality, but not after sensuous reality such as we had before, for here Reason holds itself to be the real. Here we have the Notion which is sensible of its own deficiency; this theoretic Reason could not be, as in it the Notion had to remain the Notion. Thus we have the standpoint of absoluteness revealed, since there is an infinite disclosed within the human breast. The satisfying part in Kant's philosophy is that the

truth is at least set within the heart; and hence I acknowledge that, and that alone, which is in conformity with my determined nature.

a. Kant divides will into lower and higher faculties of desire; this expression is not inapt. The lower faculties of desire are impulses, inclinations, etc.; the higher faculty is the will as such, which has not external, individual aims, but universal. To the question what the principle of will that should determine man in his actions is, all sorts of answers have been given; for instance, self-love, benevolence, happiness, etc. Such material principles of action, Kant now says, are all reducible to impulses, to happiness; but the rational in itself is purely formal, and consists in the maxim that what is to hold good as law, must be capable of being thought of as a law of universal application, without destroying itself. All morality of action now rests upon the conviction that the act is done with consciousness of the law, for the sake of the law and out of respect for the law and for itself, without any regard to what makes for happiness. As a moral Being man has the moral law in himself, the principle of which is freedom and autonomy of the will; for the will is absolute spontaneity. Determinations which are taken from the inclinations are heterogeneous principles as regards the will; or the will is heteronomy if it takes such determinations as its end and aim; for in that case it takes its determinations from something else than itself. But the essence of the will is to determine itself from itself; for practical Reason gives itself laws. But the empirical will is heteronomous, for it is determined by desires; and they belong to our nature, not to the realm of freedom.[355]

It is a highly important point in the Kantian philosophy that what self-consciousness esteems reality, law, and implicit Being, is brought back within itself. While a man is striving after this aim and that, according as he judges the world or history in one way or the other, what is he to take as his ultimate aim? For the will, however, there is no other aim than that derived

from itself, the aim of its freedom. It is a great advance when the principle is established that freedom is the last hinge on which man turns, a highest possible pinnacle, which allows nothing further to be imposed upon it; thus man bows to no authority, and acknowledges no obligations, where his freedom is not respected. Great popularity has from one point of view been won for Kantian philosophy by the teaching that man finds in himself an absolutely firm, unwavering centre-point; but with this last principle it has come to a standstill. While the highest pinnacle of the theoretic Reason is abstract identity, because it can furnish only a canon, a rule for abstract classifications,[356] practical Reason, as law-giving, is immediately regarded as concrete; the law which it gives to itself is the moral law. But even if it is stated that it is concrete in itself, there is the further consideration that this freedom is at first only the negative of everything else; no bond, nothing external, lays me under an obligation. It is to this extent indeterminate; it is the identity of the will with itself, its at-homeness with itself. But what is the content of this law? Here we at once come back to the lack of content. For the sole form of this principle is nothing more or less than agreement with itself, universality; the formal principle of legislation in this internal solitude comes to no determination, or this is abstraction only. The universal, the non-contradiction of self, is without content, something which comes to be reality in the practical sphere just as little as in the theoretical. The universal moral law Kant therefore expresses thus (and the setting up of such a universal form was at all times the demand of the abstract understanding): “Act from maxims” (the law is also to be my particular law), “which are capable of becoming universal laws.”[357]

Thus for the determination of duty (for the question which meets us is, what is duty for the free will) Kant has contributed nothing but the form of identity, which is the law of abstract Understanding. To defend one’s fatherland, to promote the happiness of another, is a duty, not because of the

content, but because it is duty; as with the Stoics, what was thought was true for the very reason that, and in so far as it was thought (Vol. II., pp. 254, 260, 263). The content as such is indeed not what holds good universally in the moral law, because it contradicts itself. For benevolence, for instance, enjoins: "Give your possessions to the poor," but if all give away what they have, beneficence is done away with (Vol. I., pp. 417, 418). Even with abstract identity, however, we do not get a step further, for every content which is put into this form is by being so put freed from self-contradiction. But nothing would be lost if it were not put into this form at all. With regard to property, for instance, the law of my actions is this: Property ought to be respected, for the opposite of this cannot be universal law. That is correct, but it is quite a formal determination: If property is, then it is. Property is here presupposed, but this determination may also in the same way be omitted, and then there is no contradiction involved in theft: If there is no such thing as property, then it is not respected. This is the defect in the principle of Kant and Fichte, that it is really formal; chill duty is the final undigested lump left within the stomach, the revelation given to Reason.

The first postulate in practical Reason is thus free, independent will which determines itself, but this concrete is still abstract. The second and third are forms which remind us that the will is concrete in a higher sense.

b. The second point is the connection of the Notion of the will with the particular will of the individual; the concrete is here the fact that my particular will and the universal will are identical, or that I am a moral human being. The unity, that man should be moral, is postulated; but beyond the "should" and this talk of morality, no advance is made. It is not said what is moral; and no thought is given to a system of the self-realizing spirit. For really, as theoretic Reason stands opposed to the objective of the senses, so practical Reason stands opposed to the practical sensuousness, to

impulses and inclinations. Perfected morality must remain a Beyond; for morality presupposes the difference of the particular and universal will. It is a struggle, the determination of the sensuous by the universal; the struggle can only take place when the sensuous will is not yet in conformity with the universal. The result is, therefore, that the aim of the moral will is to be attained in infinite progress only; on this Kant founds (Kritik der prakt. Vernunft, pp. 219-223) the postulate of the immortality of the soul, as the endless progress of the subject in his morality, because morality itself is incomplete, and must advance into infinitude. The particular will is certainly something other than the universal will; but it is not ultimate or really permanent.

c. The third point is the highest concrete, the Notion of the freedom of all men, or the natural world has to be in harmony with the Notion of freedom. That is the postulate of the existence of God, whom Reason, however, does not recognize. Will has the whole world, the whole of the sensuous, in opposition to it, and yet Reason insists on the unity of Nature or the moral law, as the Idea of the Good, which is the ultimate end of the world. Since, however, it is formal, and therefore has no content on its own account, it stands opposed to the impulses and inclinations of a subjective and an external independent Nature. Kant reconciles the contradiction of the two (Kritik der prakt. Vernunft, pp. 198-200) in the thought of the highest Good, in which Nature is conformed to rational will, and happiness to virtue; — a harmony which does not enter into the question at all, although practical reality consists therein. For happiness is only one's own sensuous consciousness, or the actuality of a particular individual, not universal reality in itself. The unification spoken of itself therefore remains only a Beyond, a thought, which is not actually in existence, but only ought to be. Kant (Kritik der prakt. Vernunft, pp. 205-209) thus agrees entirely with the talk which alleges that in this world it often fares ill with the good, and well

with the wicked, and so on; and he postulates further the existence of God as the Being, the causality, through whom this harmony comes to pass, on behalf both of the sanctity of the moral law, and of the rational end to be attained in Nature, but only in infinite progress; which postulate, like that of the immortality of the soul, allows the contradiction to remain as it is all the time, and expresses only in the abstract that the reconciliation ought to come about. The postulate itself is always there, because the Good is a Beyond with respect to Nature; the law of necessity and the law of liberty are different from one another, and placed in this dualism. Nature would remain Nature no longer, if it were to become conformed to the Notion of the Good; and thus there remains an utter opposition between the two sides, because they cannot unite. It is likewise necessary to establish the unity of the two; but this is never actual, for their separation is exactly what is presupposed. Kant employs popular language thus: evil ought to be overcome, but yet must not have been overcome. God is to him, therefore, only a faith, an opinion, which is only subjectively, and not absolutely true.[358] This result is also of a very popular character.

These postulates express nothing but the synthesis, devoid of thought, of the different moments which contradict each other on every hand; they are therefore a “nest”[359] of contradictions. For instance, the immortality of the soul is postulated on account of imperfect morality, *i.e.* because it is infected with sensuousness. But the sensuous is implied in moral self-consciousness; the end, perfection, is what really destroys morality as such. Similarly the other aim, the harmony of the sensuous and the rational, to an equal extent abrogates morality; for that consists in this very opposition of Reason to the sensuous. The actuality of the God who produces harmony is of such a character that it does not enter into consciousness at all; it is accepted by consciousness for the sake of harmony, just as children make some kind of scarecrow, and then agree with each other to pretend to be

afraid of it. The ground on which God is accepted — that by the conception of a holy law-giver the moral law may acquire additional reverence — contradicts the fact that morality really consists in reverence for the law simply for its own sake.[360] In Practical Reason self-consciousness esteems itself to be implicit Being, as contrasted with theoretic Reason, which assigns implicitude to objective existence, but the one, we see, attains just as little as the other to unity and actuality in itself. It is hard for man to believe that Reason actually exists: but there is nothing real except Reason; it is the absolute power. The vanity of man aspires to have an ideal before him, in order to be able to find fault with everything alike. We possess all wisdom, it is within us, but is not forthcoming. That is the ultimate standpoint; it is a high standpoint, no doubt, but in it the truth is never reached. The absolute Good remains "what ought to be," or without objectivity; and there it has to remain.

3. There is still left for us to consider the third side in Kant's philosophy, the Critique of the Faculty of Judgment, in which the demand for the concrete comes in, the demand that the Idea of unity spoken of before should be established not as a Beyond, but as present; and this side is of special importance. Kant says that the understanding no doubt regulates in the theoretic sphere and produces categories; but these remain mere general determinations, beyond which lies the particular (the other element which belongs to every item of knowledge). The two are distinguished from one another for the understanding; for its distinctions remain in universality. In the practical sphere Reason is certainly the implicit, but its free independence, its law-giving freedom in higher form, is opposed to Nature in its freedom or to Nature's own laws. "In the theoretic sphere Reason can draw conclusions from given laws through syllogisms, only by means of the understanding, and these conclusions never get beyond Nature; it is only in the practical sphere that Reason itself gives laws. Understanding and"

(practical) "Reason have two different regulative systems on one and the same ground of experience, without the one being detrimental to the other. For if the Notion of Nature has but little influence on the giving of laws by the Notion of Freedom, just as little does the latter interfere with the legislation of Nature. The possibility of the existence side by side of the two regulative systems and of the powers belonging to them was proved in the Critique of pure Reason." (!?) "Now if a unity is not constituted by these two different spheres, which certainly do not put a limit on each other in their regulative action, but do so incessantly in their operations in the sensuous world" (*i.e.* where they encounter each other), "the reason is this, that the Notion of Nature represents its objects in perception, not as things in themselves, but as mere phenomena, while the Notion of Freedom, on the other hand, represents in its object a thing in itself, no doubt, but not in perception. Consequently neither of them can attain to a theoretic knowledge of its object (and even of the thinking subject) as a thing-in-itself, which last would be the supersensuous, an unlimited and inaccessible realm for our whole faculty of knowledge. Now truly there is fixed a gulf over which the eye cannot reach, between the realm of the Notion of Nature, as the sensuous, and the realm of the Notion of Freedom, as the supersensuous, so that it is not possible to pass from the one to the other, since it is just as if there were two different worlds, the first of which could have no influence on the second. Nevertheless the latter is conceived as having an influence on the former, or, in other words, freedom is conceived as having for its mission the realization in the sensuous world of the end indicated by the laws of freedom. Consequently Nature must be so conceived that, while in form it realizes its own laws, there may yet be a possibility of ends being realized in it according to the laws of freedom. Therefore there must surely be some ground for the unity of the supersensuous which lies at the foundation of Nature with that which the

Notion of Freedom practically contains, the Notion of which ground of unity, although it attains neither theoretically nor practically to a knowledge of the same, and consequently has no peculiar province, yet makes possible the transition from the mode of thought in accordance with the principles of the one, to the mode of thought in accordance with the principles of the other. Between Understanding and Reason there now comes the Faculty of Judgment, as between the powers of knowledge and desire there come pleasure and its opposite; in this faculty must therefore lie the transition from the province of the Notions of Nature to the province of the Notion of Freedom."[361]

Adaptation to ends has its place here, *i.e.* a particular reality, which is determined only through the universal, the end. The understanding is the ground of this unity of the manifold; the sensuous is therefore here determined by means of the supersensuous. This idea of a universal which implicitly contains the particular is according to Kant the precise object of the faculty of judgment, which he divides as follows:— "If the universal (the rule, principle, law) is given, the faculty of judgment which subsumes the particular under that universal, is determinative," — the immediate faculty of judgment. But here there is also a particular which is not determined by species. "If, however, only the particular is given, for which the faculty of judgment has to find the universal, it is reflective." The reflective judgment has as its principle the unity of particularity and the abstract universal of the understanding, the idea of a legal necessity which is at the same time free, or of a freedom which is directly one with its content. "This principle can be no other but the fact that since universal laws of Nature have their foundation in our understanding, which prescribes them to nature, although only according to their general conception, the particular, empirical laws, in so far as they are undetermined by universal laws, must be viewed as containing that unity which they would contain if

they had been given by some intelligence — other, it may be, than our own — with express reference to our cognitive faculties, in order to render possible a system of experience according to particular natural laws. It is not as if such an intelligence must be assumed (for it is only the reflective faculty of judgment to which this idea serves as principle): this faculty gives a law only to itself, not to Nature in addition. Now the conception of an object (if it at the same time contains the ground of the reality of this object), the end, and the harmony of a thing with that quality of things which is only possible in conformity with ends, are termed the adaptation to purpose of the form; therefore the principle of the faculty of judgment in respect to the form of the things of Nature under empirical laws in general is the adaptability to purpose of Nature in its multiplicity. That is to say, Nature is represented by this Notion as if an intelligence contained the ground of the unity in multiplicity of Nature's empirical laws."[362]

Aristotle already regarded Nature as in itself showing this adaptation to end, and as having in itself νοῦς, intelligence, the Universal, so that in undivided unity one element is moment of another (*v.* Vol. II. pp. 156-162). Purpose is the Notion, and immanent; not external form and abstraction as distinguished from a fundamental material, but penetrating, so that all that is particular is determined by this universal itself. According to Kant this is Understanding: no doubt the laws of the Understanding, which it implicitly has in knowledge, leave the objective still undetermined, but because this manifold itself must have a connection in itself, which is yet contingent for human intelligence, "the faculty of judgment must assume as a principle for its own use that what is contingent for us contains a unity, which for us indeed is not knowable, but yet thinkable, in the connection of the manifold with an implicitly possible experience."[363] This principle hereby at once falls back again into the subjectivity of a thought, and is only a maxim of our reflection, by which nothing is to be expressed regarding the objective

nature of the object,[364] because Being-in-itself is once for all fixed outside of self-consciousness, and the Understanding is conceived only in the form of the self-conscious, not in its becoming another.

Now this principle of the reflective faculty of judgment is in itself a two-fold adaptation to end, the formal and the material; the faculty of judgment is thus either æsthetic or teleological: of these the former has to do with subjective, the latter with objective, logical adaptation to end. There are thus two objects of the faculty of judgment — the beautiful in works of art and the natural products of organic life — which make known to us the unity of the Notion of Nature and the Notion of Freedom.[365] The consideration of these works involves the fact, that we see a unity of the Understanding and the particular. But as this consideration is only a subjective manner of representing such products, and does not contain the truth of the same, such things are regarded only according to this unity, and they are not in themselves of this nature; what they are in themselves lies beyond.

a. The Beautiful of the æsthetic faculty of judgment consists in the following: "Pleasure and displeasure are something subjective, which can in no way become a part of knowledge. The object has adaptation to end only to the extent that its conception is directly bound up with the feeling of pleasure; and this is an æsthetic conception. The taking up of forms into the imaginative faculty can never occur without the reflecting faculty of judgment at least comparing them, even unintentionally, by means of its power of relating perceptions to Notions." Now if in this comparison the imaginative faculty (as a faculty of perceptions *a priori*?) "is, by means of a conception given" — something beautiful,— "unintentionally placed in agreement with the Understanding, as the faculty of Notions, and thereby a feeling of pleasure is awakened, the object must then be looked on as in conformity with end for the reflecting faculty of judgment. Such a judgment

regarding the adaptability to end of the object, a judgment which is grounded on no previous Notion of the object, and furnishes no Notion of it, is an æsthetic judgment. An object whose form (not the material of its conception as sensation) is judged to be a cause of the pleasure which springs from the conception of such an object, is beautiful," — the first reasonable thing said about beauty. The sensuous is one moment of the Beautiful, but it must also express the spiritual, a Notion. "The Beautiful is what is conceived without" subjective "interest," but similarly also "without Notions" (*i.e.* determinations of reflection, laws) "as object of a universal pleasure. It is related to no inclination, therefore the subject feels itself quite free therein. It is not beautiful *for me*. The end is the object of a Notion, so far as the latter is looked on as the cause of the former" (the object); "and the causality of a Notion in respect to its object is adaptation to end." To the ideal belongs "the Idea of reason, which makes the aims of humanity, as far as they cannot be sensuously conceived, the principle of judgment of a form through which these aims reveal themselves as their effect in the phenomenon. The ideal we may expect to find revealed only in human form."

The sublime is the effort to give sensuous expression to an Idea in which the inconceivability of the Idea, and the impossibility of finding an adequate expression of it by means of the sensuous, are clearly evidenced.[366] Here in the æsthetic faculty of judgment we see the immediate unity of the universal and the particular; for the Beautiful is this very unity, without Notion and immediate. Because Kant, however, places it in the subject, it is limited, and as æsthetic it also ranks lower, inasmuch as it is not the unity as Notion.

b. The other manner of bringing harmony to pass is the teleological way of regarding Nature, which is found in the objective and material adaptation to end. Here the immediate unity of the Notion and reality is looked upon as objective in the organic products of Nature — this being the purpose of

Nature, containing in its universality the particular, in its particularity the species. But such a mode of consideration must be practised not externally, but in conformity with internal teleology. In external adaptation to end one thing has its end in another: "Snow protects the sown crops in cold lands from frost, and facilitates the intercourse of men by permitting of sleighing."[367] Internal adaptation to end signifies, on the contrary, that a thing is in itself end and means, its end is not therefore beyond itself. In the contemplation of the living creature we do not remain at the point of having something sensuous before us, which according to the categories of the Understanding is only brought into relation to something other than itself; for we regard it as cause of itself, as producing itself. This is the self-preservation of the living creature; as an individual it is no doubt perishable, but in living it produces itself, although for that purpose certain conditions are requisite. The end or purpose of Nature is therefore to be sought for in matter, to the extent that matter is an inwardly organized product of nature, "in which all is end, and all in turn is means;"[368] because all the members of the organism are at the same time means and end, it is an end in itself. That is the Aristotelian Notion — the infinite that returns into itself, the Idea.

Kant at this point calls to mind the following: "We should find no difference between natural mechanism and the technique of Nature, *i.e.* the connection of ends in the same, were our Understanding not of such a kind that it must pass from the universal to the particular, and the faculty of judgment can therefore pronounce no determining sentences, without having a universal law under which it may subsume the particular. Now the particular as such contains a contingent element in regard to the universal, but nevertheless Reason also demands unity in the connection of particular laws of Nature, and consequently a regulative character, which character when found in the contingent is termed adaptation to end: and the derivation of particular laws from universal is, in regard to the element of contingency

which those particular laws contain, *a priori* impossible through the determination of the Notion of the object; the Notion of the adaptation to end of Nature in its products becomes thus a Notion necessary for the human faculty of judgment, but not affecting the determination of the objects themselves, and therefore a subjective principle."[369] An organic Being is therefore, according to Kant (Kritik der Urtheilskraft, p. 354) one in which natural mechanism and end are identical. We regard it as if there dwelt in the sensuous a Notion which brings the particular into conformity with itself. In the organic products of Nature we perceive this immediate unity of the Notion and reality; for in a living creature there is perceived in one unity the soul, or the universal, and existence or particularity, which is not the case with inorganic Nature. Thus there enters into the Kantian philosophy the conception of the concrete, as that the universal Notion determines the particular. But Kant took these Ideas again in a subjective sense only, as guiding thoughts for the faculty of judgment, by which no Being-in-itself can be expressed; and thus, although he expresses the unity of the Notion and reality, he yet lays fresh emphasis on the side of the Notion. He will not therefore throw off his limitations in the moment in which he assumes them as limitations. This is the perpetual contradiction in Kant's philosophy: Kant exhibited the extremes of opposition in their one-sidedness, and expressed also the reconciliation of the contradiction; Reason postulates unity, and this we have also in the faculty of judgment. Kant, however, says (Kritik der Urtheilskraft, pp. 355-363): This is only a mode of our reflecting faculty of judgment, life itself is not so; we are merely accustomed so to regard it. In art it is thus certainly the sensuous mode which gives us the conception of the Idea; reality and ideality are here directly in one. But at this point also Kant says that we must remain at what is one-sided, at the very moment when he is passing out beyond it. The wealth of thought therefore still unfolds itself with Kant in subjective form

alone; all fulness, all content, concentrates in conceiving, thinking, postulating. The objective, according to Kant, is only what is in itself; and we know not what Things-in-themselves are. But Being-in-itself is only the *caput mortuum*, the dead abstraction of the "other," the empty, undetermined Beyond.

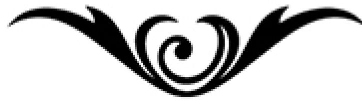
The reason why that true Idea should not be the truth is therefore that the empty abstractions of an understanding which keeps itself in the abstract universal, and of a sensuous material of individuality standing in opposition to the same, are presupposed as the truth. Kant no doubt expressly advances to the conception of an intuitive or perceiving understanding, which, while it gives universal laws, at the same time determines the particular; and the determination thus given is deep; it is the true concrete, reality determined by the indwelling Notion, or, as Spinoza says, the adequate Idea. For "to knowledge there also belongs intuitive perception, and the possession of a perfect spontaneity of intuition would be a faculty of knowledge" specifically "distinct from the sensuous, and quite independent thereof, and therefore it would be understanding in the most universal sense. Consequently it is possible to think of an intuitive understanding which does not pass from the universal to the particular, and thus proceed through conceptions to the individual — an understanding in which we do not meet with the contingency of the harmony of Nature in her products, according to particular laws, with the understanding, a contingency which makes it so hard for our understanding to bring" together "into the unity of knowledge the manifold of Nature." But that this "*intellectus archetypus*" is the true Idea of the understanding, is a thought which does not strike Kant. Strange to say, he certainly has this idea of the intuitive; and he does not know why it should have no truth — except because our understanding is otherwise constituted, namely such "that it proceeds from the analytic universal to the particular."[370] But absolute Reason and Understanding in itself, as we have

already seen (pp. 432, 461), are, in Kant's view, of such a nature that they have no reality in themselves: the Understanding requires material to work upon, theoretic Reason spins cobwebs of the brain, practical Reason has to allow its reality to come to an end with its postulates. In spite of their directly and definitely expressed non-absoluteness, they are yet looked on as true knowledge; and intuitive Understanding, which holds Notion and sensuous perception in one unity, is looked on as a mere thought which we make for ourselves.

c. The highest form in which the conception of the concrete comes into Kant's philosophy is this, that the end is grasped in its entire universality; and thus it is the Good. This Good is an Idea; it is my thought; but there exists the absolute demand that it should be realized also in the world, that the necessity of Nature should correspond with the laws of freedom, not as the necessity of an external Nature, but through what is right and moral in human life, through life in the State, — or in other words that the world in general should be good. This identity of the Good and reality is the demand of practical Reason; but subjective Reason cannot realize this. In every good action a man no doubt accomplishes something good, but this is only limited; universal Good, as the final object of the world, can be attained to only through a third. And this power over the world, which has as its final object the Good in the world, is God.[371] Thus the Critique of the Faculty of Judgment also ends with the postulate of God. Now, although the particular laws of Nature, as independent individual relations, have no relation to the Good, Reason consists in having and desiring unity as the essential or substantial in itself. The opposition of these two, the Good and the world, is contrary to that identity; Reason must therefore demand that this contradiction should be abrogated, that there should be a power which is good on its own account, and is a Power over Nature. This is the position which God assumes in Kant's philosophy: no proof is possible, he says, of

God’s existence, but the demand is there. The deficiency here is the impossibility of proving God’s existence, and it consists in this, that if we admit Kant’s dualism, it cannot be shown how the Good as abstract Idea in itself is the abrogating of its Idea as abstract; and how the world in itself is the abrogating of itself in its externality, and in its diversity from the Good — this being done in order that both may reveal themselves to be their truth, which in respect to them appears as the Third, but is at the same time determined as the First. Thus, therefore, according to Kant (Kritik der Urtheilskraft, pp. 460, 461), God can only be believed in. We associate the faith of Jacobi with this; for in this point Kant agrees with Jacobi.[372]

If now, in accordance with this standpoint of Kant and Jacobi, God is believed in, and we admit this standpoint for an instant, there is certainly a return to the Absolute. But the question remains: What is God? To define Him as supersensuous is not much, nor is it more to say He is universal, abstract, absolute. What then is His determination? Were we here, however, to pass over to determinations of the Absolute, the evil result would follow, as far as this standpoint is concerned, that we should pass over to knowledge; for this signifies knowledge of an object which is in itself concrete, *i.e.* determined. But here the furthest point reached is the general statement that God exists with the determination of being infinite, universal, indeterminate. God cannot be known in this way; for in order to be known He must as concrete possess at least two determinations. In this way mediation would be established, for a knowledge of the concrete is at once a mediate knowledge. But this standpoint lacks mediation, and thus remains at the immediate. Paul, in speaking to the Athenians, appeals to the altar which they had dedicated to the Unknown God, and declares to them what God is; but the standpoint indicated here takes us back to the Unknown God. All the life of Nature, as of Spirit, is mediation in itself; and to this mediation the philosophy of Schelling now passed on.



If we sum up the Kantian philosophy, we find on all hands the Idea of Thought, which is in itself the absolute Notion, and has in itself difference, reality. In the theoretic and practical Reason it has only abstract difference, but in the Faculty of Judgment, as the unity of the two, Kant goes so far as to establish the difference as actual, establishing not only particularity, but also individuality. But, to be sure, this Philistine conception proceeds from our human faculty of knowledge, which is valid for him in its empirical form, notwithstanding his statement that it does not know the truth, and his further description of the true idea of the same as being merely a thought which we possess. Therefore actuality counts as something sensuous, empirical, for the comprehension of which Kant takes the categories of the Understanding, giving them the same validity as they have in every-day life. This is a complete philosophy of the Understanding, which renounces Reason: the reason why it became so popular was the negative one, that men were once for all free from the old metaphysic. According to Kant something sensuous is produced, having thought-determinations, which, however, is not the thing, for if a man, for instance, feels something hard, Kant says: "I feel hardness, but I do not feel Something." Kant's philosophy thus ends with a dualism, with the relation which is a plainly essential "ought," with the unreconciled contradiction. It is otherwise with Jacobi's faith; he finds the conception of God as immediate existence, and all mediation is untrue for him. With Kant, therefore, the result is: "We know only phenomena;" with Jacobi, on the other hand, it is: "We know only the finite and conditioned." Over these two results there has been unmingled joy among men, because the sloth of Reason (Heaven be praised!) considered itself liberated from every call to reflect, and now, being saved the trouble of penetrating to its own inward meaning and exploring the depths of Nature and Spirit, it could very well leave itself alone. The further result attending this is the autocracy of the subjective Reason, which, seeing

that it is abstract and without knowledge, has only subjective certainty and not objective truth. The second cause of rejoicing was the concession to freedom of a perfect right, which I can neither understand nor justify, and need not do so; my subjective liberty of conviction and certainty holds good all round. The third cause of joy was added by Jacobi, who said that it amounted even to a crime to seek to know the truth, because the infinite was thereby only rendered finite. Truth is in a bad way, when all metaphysic is done away with, and the only philosophy acknowledged is not a philosophy at all!

But besides the general idea of synthetic judgments *a priori*, a universal which has difference in itself, Kant's instinct carried this out in accordance with the scheme of triplicity, unspiritual though that was, in the whole system into which for him the entire universe was divided. This he not only practised in the three critiques, but he also followed it out in most of the sub-divisions under the categories, the ideas of Reason, &c. Kant has therefore set forth as a universal scheme the rhythm of knowledge, of scientific movement; and has exhibited on all sides thesis, antithesis and synthesis, modes of the mind by means of which it is mind, as thus consciously distinguishing itself. The first is existence, but in the form of Other-Being for consciousness; for what is only existence is object. The second is Being-for-self, genuine actuality; here the reverse relation enters in, for self-consciousness, as the negative of Being-in-itself, is itself reality. The third is the unity of the two; the absolute, self-conscious actuality is the sum of true actuality, into which are re-absorbed both the objective and the independently existent subjective. Kant has thus made an historical statement of the moments of the whole, and has correctly determined and distinguished them: it is a good introduction to Philosophy. The defect of Kant's philosophy consists in the falling asunder of the moments of the absolute form; or, regarded from the other side, our understanding, our

knowledge, forms an antithesis to Being-in-itself: there is lacking the negative, the abrogation of the "ought," which is not laid hold of. But thought and thinking had become once for all an absolute requisite that could no longer be set aside. It was consequently in the first place demanded by consistency that particular thoughts should appear as if produced of necessity from the original unity of the ego, and in that way justified. But, in the second place, thought had spread itself over the world, had attached itself to everything, investigated everything, introduced its forms into everything, and systematized everything, so that on every hand thought-determinations had to be followed, instead of any mere feeling or routine or practical common-sense, or what is evidenced in the extraordinary lack of understanding on the part of so-called practical men. And therefore in theology, in governments and their legislation, in the object aimed at by the state, in trades and in mechanics, it is said that men ought to act according to universal determinations, *i.e.* rationally: and men even talk of a rational brewery, a rational brick-kiln, etc. This is the requisite of concrete thought; while in the Kantian result, which is that of phenomenon, an empty thought was alone present. It is verily also the essence of revealed religion to know what God is. There was, therefore, to be found a yearning desire for content, for truth, since man could not possibly return to the condition of a brute, nor yet sink to the form of sensation, so that this yearning was for him the only thing that held good with regard to the higher life. The first requirement — consistency — Fichte sought to satisfy; the other — content — Schelling strove to fulfil.

C. Fichte.

FICHTE CREATED A great sensation in his time; his philosophy is the Kantian philosophy in its completion, and, as we must specially notice, it is set forth in a more logical way. He does not pass beyond the fundamentals of Kant's philosophy, and at first regarded his own philosophy as no more than a systematic working out of the other.[373] In addition to these systems of philosophies, and that of Schelling, there are none. Any that pretend to be such merely pick out something from these, and over this they fight and wrangle among themselves. *Ils se sont battus les flancs, pour être de grands hommes.* For in those times there were in Germany many systems of philosophy, such as those of Reinhold, Krug, Bouterweck, Fries, Schulze, &c.; but in them there is only an extremely limited point of view, combined with boastfulness — a strange medley of stray thoughts and conceptions or facts which I find within me. But their thoughts are all derived from Fichte, Kant, or Schelling — that is in so far as there are thoughts there present at all. Or else some slight modification is added, and this for the most part merely consists in making the great principles barren, what points in them were living are destroyed, or else subordinate forms are changed, whereby another principle is said to be set forth, though when we look closer we find that these principles are but the principles of one of those philosophies that have gone before. This may serve as a justification for my not speaking further of all these philosophies; any exposition of them would be no more than a demonstration that everything in them is taken from Kant, Fichte, or Schelling, and that the modification in form is only the semblance of a change, while really it indicates a deterioration in the principles of those philosophies.

Johann Gottlieb Fichte was born on the 19th of May, 1762, at Rammenau, near Bischoffswerda, in Upper Lusatia. He studied at Jena, and for some time was a private tutor in Switzerland. He wrote a treatise on Religion, termed a "Critique of all Revelation," where the Kantian phraseology is employed throughout — so much so that it was thought to be the work of Kant. After this he was in 1793 summoned to Jena by Goethe as Professor of Philosophy, which appointment he, however, resigned in the year 1799, on account of an unpleasantness which had arisen through his essay "On the ground of our Belief in a Divine Government of the World." For Fichte published a journal in Jena, and a paper in it which was by someone else was regarded as atheistical. Fichte might have kept silence, but he published the above-mentioned essay as an introduction to the article. The authorities wished an investigation to be made into the matter. Then Fichte wrote a letter which contained threats, and respecting it Goethe said that a Government ought not to allow itself to be threatened. Fichte now taught privately for some time in Berlin; in 1805 he became professor at Erlangen, and in 1809 at Berlin, at which place he died on the 27th January, 1814.[374] We cannot here deal more particularly with the details of his life.

In what is termed the philosophy of Fichte a distinction must be made between his properly-speaking speculative philosophy, in which the argument is most consistently worked out, and which is less well known, and his popular philosophy, to which belong the lectures delivered in Berlin before a mixed audience, and, for example, the work termed a "Guidance to a Blessed Life." These last have much in them that is affecting and edifying — many who call themselves the disciples of Fichte know this side alone — and they are expressed in language most impressive to a cultured, religious temperament. In the history of Philosophy, however, such cannot

be taken into consideration, although through their matter they may have the highest possible value; the content has to be speculatively developed, and that is done in Fichte's earlier philosophic works alone.[375]

1. The First Principles of Fichte's Philosophy.

As we mentioned above (p. 478), the shortcoming in the Kantian philosophy was its unthinking inconsistency, through which speculative unity was lacking to the whole system; and this shortcoming was removed by Fichte. It is the absolute form which Fichte laid hold of, or in other words, the absolute form is just the absolute Being-for-self, absolute negativity, not individuality, but the Notion of individuality, and thereby the Notion of actuality; Fichte's philosophy is thus the development of form in itself. He maintained the ego to be the absolute principle, so that from it, the direct and immediate certainty of self, all the matter in the universe must be represented as produced; hence, according to Fichte, reason is in itself a synthesis of Notion and actuality. But this principle he once more in an equally one-sided manner set aside; it is from the very beginning subjective, conditioned by an opposite, and its realization is a continual rushing onward in finitude, a looking back at what has gone before. The form in which it is presented has also the disadvantage, and indeed, the real drawback of bringing the empiric ego ever before one's eyes, which is absurd, and quite distracting to one's point of view.

The claims of Philosophy have advanced so far that in the first place self-consciousness refuses any longer to regard absolute essence as immediate substance which does not in itself possess difference, reality, and actuality. Against this substance self-consciousness ever struggled, for it does not find its explicit Being there, and consequently feels the lack of freedom. But besides this it demanded that this essence, objectively presented, should be personal, living, self-conscious, actual, and not shut up

in abstract metaphysical thoughts alone. On the other hand consciousness, for which the other is, demanded the moment of external actuality, Being as such, into which thought must pass, truth in objective existence; and this is what we more especially noticed in connection with the English. This Notion, which is immediately actuality, and this actuality which is immediately its Notion, and that indeed in such a way that there neither is a third thought above this unity, nor is it an immediate unity which does not possess difference, separation, within it, is the ego; it is the self-distinction of opposites within itself. That whereby it distinguishes itself from the simplicity of thought, and distinguishes this other, is likewise immediately for it; it is identical with, or not distinguished from it.[376] Hence it is pure thought, or the ego is the true synthetic judgment *a priori*, as Kant called it. This principle is apprehended actuality, for the taking back of the other-Being into self-consciousness is just apprehension. The Notion of the Notion is from this point of view found in the fact that in what is apprehended self-consciousness has the certainty of itself; what is not apprehended is something foreign to it. This absolute Notion or this absolutely existent infinitude it is which has to be developed in knowledge, and its distinction as the whole distinction of the universe has to be represented from itself, and this has in its distinction to remain reflected within itself in equal absoluteness. Nothing other than the ego anywhere exists, and the ego is there because it is there; what is there is only in the ego and for the ego.[377]

Now Fichte merely set forth this Notion; he did not bring it to a scientific realization from itself. For to him this Notion maintains and asserts itself as this Notion; it has absoluteness for him in so far as it is merely the unrealized Notion, and thus indeed comes once more into opposition with reality. The Fichtian philosophy has the great advantage of having set forth the fact that Philosophy must be a science derived from one supreme

principle, from which all determinations are necessarily derived. The important point is this unity of principle and the attempt to develop from it in a scientifically consistent way the whole content of consciousness, or, as has been said, to construct the whole world.[378] Beyond this no progress was made.[379] But the great necessity in Philosophy is to possess one living Idea; the world is a flower which is eternally produced from one grain of seed. Thus Fichte does not, like Kant, throw his work into narrative form because he begins with the ego; but he has proceeded further, inasmuch as he sought to bring about a construction of determinations of knowledge from the ego. The whole extent of knowledge in all the world must be developed, and further this knowledge must be the consequence of the development of determinations; but because Fichte says that what is not for us does not concern us, he has not grasped this principle of the ego as Idea, but solely in the consciousness of the activity which we exercise in knowing, and consequently it is still laid hold of in the form of subjectivity.

Thus as Kant treats of cognition [Erkennen], so Fichte sets forth real knowledge [Wissen]. Fichte states that the task of Philosophy is to find a theory of knowledge; universal knowledge is both the object and the starting-point of Philosophy. Consciousness knows, that is its nature; the end of philosophic learning is the knowledge of this knowledge. Hence Fichte called his philosophy the Theory of Knowledge (Begriff der Wissenschaftslehre, p. 18), the science of knowledge. That is to say ordinary consciousness as the active ego finds this and that, occupies itself, not with itself, but with other objects and interests, but the necessity that I bring forth determinations, and which determinations — cause and effect, for example, — lies beyond my consciousness: I bring them forth instinctively and cannot get behind my consciousness. But when I philosophize, I make my ordinary consciousness itself my object, because I make a pure category my consciousness: I know what my ego is doing, and

thus I get behind my ordinary consciousness. Fichte thus defines Philosophy as the artificial consciousness, as the consciousness of consciousness.[380]

a. Where Fichte in his system has attained the highest degree of determinateness, he begins, as we saw Kant did before (pp. 437, 438), from the transcendental unity of self-consciousness; in it I — as this — am one, this unity is to Fichte the same and the original. Ego is there a fact, says Fichte, but not yet a proposition. As proposition, as principle, the ego must not remain barren, nor be accepted as one, for to a proposition pertains a synthesis. Now Fichte proceeds in his system from the fact that Philosophy must begin with an absolutely unconditioned, certain principle, with something indubitably certain in ordinary knowledge. "It cannot be proved or defined, because it must be absolutely the first principle."[381] According to Wendt's account (Tennemann's Grundriss, § 393, pp. 494, 495) Fichte gives an exposition of the necessity of such a principle as follows: "Scientific knowledge is a system of cognition obtained through a supreme principle which expresses the content and form of knowledge. The theory of knowledge is the science of knowledge which sets forth the possibility and validity of all knowledge, and proves the possibility of principles in reference to form and content, the principles themselves, and thereby the connection existing in all human knowledge. It must have a principle which can neither be proved from it nor from another science; for it is supreme. If there is a theory of knowledge there also is a system; if there is a system there is also a theory of knowledge and an absolute first principle — and so on through an inevitable circle."[382]

The simple principle of this knowledge is certainty of myself, which is the relation of me to myself; what is in me, that I know. The supreme principle, as immediate and not derived, must be certain on its own account; that is, a determination of the ego only, for it is only from the ego that I

cannot abstract.[383] Fichte thus begins, like Descartes, with ‘I think, therefore I am,’ and he expressly brings this proposition to mind. The Being of the ego is not a dead, but a concrete Being; but the highest Being is thought. Ego, as an explicitly self-existent activity of thought, is thus knowledge, even if it is only abstract knowledge, as in the beginning at least it cannot help being. At the same time Fichte begins from this absolute certainty with quite other necessities and demands; for from this ego not only Being but also the larger system of thought has to be derived (*supra*, p. 230). According to Fichte, the ego is the source of the categories and ideas, but all conceptions and thoughts are a manifold reduced to a synthesis through Thought. Thus while with Descartes in connection with the ego other thoughts appear which we simply find already in us, such as God, nature, &c., Fichte sought for a philosophy entirely of a piece, in which nothing empiric was to be admitted from without. With this reflection a false point of view was at once introduced, namely that contained in the old conception of knowledge, of commencing with principles in this form and proceeding from them; so that the reality which is derived from such a principle is brought into opposition with it, and hence in truth is something different, *i.e.* it is not derived: or that principle for this same reason expresses only the absolute certainty of itself and not the truth. The ego is certain, it cannot be doubted; but Philosophy desires to reach the truth. The certainty is subjective, and because it is made to remain the basis, all else remains subjective also without there being any possibility of this form being removed. Fichte now analyzes the ego, reducing it to three principles from which the whole of knowledge has to be evolved.

α. The first proposition must be simple, in it predicate and subject must be alike; for were they unlike, their connection — since in accordance with their diversity the determinations are not directly one — would have to be first of all proved by means of a third. The first principle must thus be

identical. Fichte now proceeds further to distinguish in this first principle the form and content; but in order that this same may be immediately true through itself, form and content must be again the same, and the principle conditioned by neither. It signifies A = A, the abstract undetermined identity; that is the proposition of contradiction, wherein A is an indifferent content. Fichte says, “Thought is by no means essence, but only a particular determination of Being; there are outside of it many other determinations of our Being. I merely remark this, that when ‘I am’ is overstepped, Spinozism is necessarily reached. Its unity is something which ought to be produced through us, but which cannot be so; it is not anything that is.” The first proposition is then that I am identical with myself, Ego = Ego;[384] that undoubtedly is the definition of the ego. The subject and the predicate are the content; and this content of the two sides is likewise their relation, *i.e.* form. Relation requires two sides; the relating and the related are here, however, the same; for on account of the simplicity of the ego, there is nothing but a relation of the ego to the ego. I have knowledge of myself; but in so far as I am consciousness, I know of an object which is different from me, and which is then likewise *mine*. But the ego is in such a way identical with its difference that what is different is immediately the same, and what is identical is likewise different; we have a difference without a difference. Self-consciousness is not dead identity, or non-Being, but the object which is identical with me. This is immediately certain; all else must be as certain to me, inasmuch as it must be my relation to myself. The content must be transformed into the ego, so that in it I have *my* determination alone. This principle is at first abstract and deficient, because in it no difference, or a formal difference only is expressed; whereas the principle should possess a content: a subject and a predicate are indeed distinguished in it, but only for us who reflect upon it, *i.e.* in itself there is no difference, and consequently no true content. In the second place, this principle is indeed the immediate

certainty of self-consciousness, but self-consciousness is likewise consciousness, and in it there is likewise the certainty that other things exist to which it stands in an attitude of opposition. In the third place, that principle has not the truth in it, for the very reason that the certainty of itself possessed by the ego has no objectivity; it has not the form of the differentiated content within it — or it stands in opposition to the consciousness of an "other".

β. Now in order that determination should come to pass, *i.e.* a content and difference, it is essential for Fichte that a second principle should be established, which in regard to form is unconditioned, but the content of which is conditioned, because it does not belong to the ego. This second principle, set forth under the first, is, "I assert a non-ego in opposition to the ego," and in this something other than absolute self-consciousness is set forth.[385] To this pertains the form therein present, relation; but the content is the non-ego, another content from the ego. We might say that through this content the proposition is independent, since the negative therein is an absolute, as truly as the reverse — that it is independent through the form of opposition which cannot be derived from the original. Here, then, we have no more to do with derivation, although this derivation of opposition from the first proposition was all the same demanded. Inasmuch as I posit another in opposition to the ego, I posit myself as not posited; this non-ego is the object generally, *i.e.* that which is opposed to me. This other is the negative of the ego; thus when Fichte called it the non-ego he was expressing himself in a very happy, suitable, and consistent manner. There has been a good deal of ridicule cast on the ego and non-ego; the expression is new, and therefore to us Germans it seems strange at first. But the French say *Moi* and *Non-moi*, without finding anything laughable in it. In this principle the positing belongs, however, to the ego; but because the non-ego is independent of the ego, we have two sides, and self-consciousness relates

itself to another. This second proposition thus signifies that I posit myself as limited, as non-ego; but non-ego is something quite new to be added. On the one side we thus have before us a field which is merely appropriated from the ego; and in this way we have before us the non-ego as our object.

γ. To these is added yet a third proposition, in which I now make this division into ego and non-ego: it is the synthetic principle, the proposition of ground, which in content is unconditioned, just as in the second was the case in regard to form. This third proposition is the determination of the first two through one another, in such a way that the ego limits the non-ego. "In and through the ego both the ego and the non-ego are posited as capable of being mutually limited by means of one another, *i.e.* in such a way that the reality of the one abrogates the reality of the other." In limitation both are negated, but "only in part"; only thus are synthesis and deduction possible. I posit the non-ego, which is for me, in myself, in my identity with myself; thus I take it from its non-identity, its not-being-I, that is to say I limit it. This limitation of the non-ego Fichte expresses thus: "I place in opposition to the ego," and indeed "to the divisible ego, a divisible non-ego." The non-ego I destroy as a complete sphere, which it was according to the second principle, and posit it as divisible; I likewise posit the ego as divisible in so far as the non-ego is present in it. The whole sphere which I have before me is supposed indeed to be the ego, but in it I have not one but two. The proposition of ground is thus the relation of reality and negation, *i.e.* it is limitation; it contains the ego limited by the non-ego, and the non-ego limited by the ego.[386] Of this synthesis there is nothing, properly speaking, contained in the two earlier propositions. Even this first presentation of the three principles does away with the immanence of real knowledge. Thus the presentation is here also subject to an opposite from the first, as it is with Kant, even if these are two acts of the ego merely, and we remain entirely in the ego.

Now that limitation may take place for me in two different ways: at one time the one is passive, at another time the other is so. In this limitation the ego may posit the non-ego as limiting and itself as limited, in such a way that the ego posits itself as requiring to have an object; I know myself indeed as ego, but determined by the non-ego; non-ego is here active and ego passive. Or, on the other hand, the ego, as abrogating other-being, is that which limits, and non-ego is the limited. I know myself then as clearly determining the non-ego, as the absolute cause of the non-ego as such, for I can think. The first is the proposition of the theoretic reason, of intelligence: the second the proposition of practical reason, of will.[387] The will is this, that I am conscious of myself as limiting the object; thus I make myself exercise activity upon the object and maintain myself. The theoretic proposition is that the object is before me and it determines me. The ego is, since I perceive, a content, and I have this content in me, which is thus outside of me. This is on the whole the same thing as we meet with in the experience of Kant: it comes to the same thing whether it is by matter or the non-ego that the ego is here determined.

b. In the theoretic consciousness the ego, although the assertive generally, finds itself limited by the non-ego. But it is identical with itself; hence its infinite activity ever sets itself to abrogate the non-ego and to bring forth itself. Now the different methods whereby the ego sets forth itself are the different methods of its activity; these we have to understand in their necessity. But since philosophic knowledge is the consideration of consciousness itself (*supra*, p. 483), I can only know knowledge, the act of the ego. Fichte thus appeals to consciousness, postulates ego and non-ego in their abstraction, and since philosophic knowledge is the consciousness of consciousness, it is not sufficient that I should find its determinations in consciousness, for I produce them with consciousness. Common consciousness, indeed, likewise brings forth all the determinations of the

ordinary conception and of thought, but without — on the theoretic side at least — having any knowledge of it; for it is the fact of being limited alone that is present to it. Thus, when I see a large square object, such as a wall, my ordinary consciousness accepts these determinations as they are given to it; the object *is*. In so doing I do not think of seeing, but of the object; seeing, however, is my activity, the determinations of my faculty of sensation are thus posited through me.[388] The ego as theoretic is, indeed, aware in philosophic consciousness that it is the ego which posits; but here it posits that the non-ego posits somewhat in me. The ego thus posits itself as that which is limited by the non-ego. I make this limitation mine; thus is it for me in me, this passivity of the ego is itself the activity of the ego. As a matter of fact, all reality which appears in the object for the ego is a determination of the ego,[389] just as the categories and other determinations were in Kant's case. Thus it is here more especially that we should expect Fichte to demonstrate the return of other-Being into absolute consciousness. However, because after all the other-Being was regarded as unconditioned, as implicit, this return does not come to pass. The ego determines the 'other,' indeed, but this unity is an altogether finite unity; non-ego has thus immediately escaped from determination once more and gone forth from this unity. What we find is merely an alternation between self-consciousness and the consciousness of another, and the constant progression of this alternation, which never reaches any end.[390]

The development of theoretic reason is the following-out of the manifold relationships between the ego and non-ego; the forms of this limitation which Fichte now goes through are the determinations of the object. These particular thought-determinations he calls categories, and he seeks to demonstrate them in their necessity; from the time of Aristotle onwards no one had thought of so doing. The first of these forms is the determination of reciprocity, which we already met with in the third proposition: "By the

determination of the reality or negation of the ego, the negation or reality of the non-ego is equally determined;" the two in one is reciprocal action. In the second place, "Causality is the same degree of activity in the one as of passivity in the other." In so far as something is considered as the reality of the non-ego, the ego is considered as passive, and, on the other hand, in so far as 'I' am real, the object is passive; this relation, that the passivity of the object is my activity or reality, and the opposite, is the conception of Causality. "As many parts of negation as the ego posits in itself, so many parts of reality it posits in the non-ego; it therefore posits itself as self-determining in so far as it is determined, and as suffering determination in so far as it determines itself. In so far," in the third place, "as the ego is regarded as embracing the whole absolutely determined realm of all reality, it is substance; on the other hand when it is posited in a not absolutely determined sphere of this realm, in so far there is an accidence in the ego."[391] That is the first rational attempt that has ever been made to deduce the categories; this progress from one determination to another is, however, only an analysis from the standpoint of consciousness, and is not in and for itself.

The ego is so far the ideal ground of all conceptions of the object; all determination of this object is a determination of the ego. But in order that it may be object, it must be placed in opposition to the ego, *i.e.* the determinations set forth through the ego are another, the non-ego; this placing of the object in opposition is the real ground of conceptions. The ego is, however, likewise the real ground of the object; for it is likewise a determination of the ego that the non-ego as object is set in opposition to the ego. Both, the real ground and the ideal ground of the conception, are thus one and the same.[392] Regarding the ego as ideal principle and the non-ego as real principle, Krug has likewise talked a great deal of nonsense. Regarded from the one point of view, the ego is active and the non-ego

purely passive; while from the other side the ego is passive and the object active and operative. But since the ego in the non-philosophic consciousness does not have the consciousness of its activity in the conception of the object, it represents to itself its own activity as foreign, *i.e.* as belonging to the non-ego.

We here see the opposition adopting various forms: ego, non-ego; positing, setting in opposition; two sorts of activity of the ego, &c. The fact that I represent is undoubtedly my activity, but the matter of main importance is the content of the positing and its necessary connection through itself. If one occupies oneself only with this content, that form of subjectivity which is dominant with Fichte, and which remains in his opposition, disappears. As the ego is affirmative and determining, there now is in this determination a negative likewise present; I find myself determined and at the same time the ego is like itself, infinite, *i.e.* identical with itself. This is a contradiction which Fichte indeed endeavours to reconcile, but in spite of it all he leaves the false basis of dualism undisturbed. The ultimate, beyond which Fichte does not get, is only an 'ought,' which does not solve the contradiction; for while the ego should be absolutely at home with itself, *i.e.* free, it should at the same time be associated with another. To Fichte the demand for the solution of this contradiction thus adopts the attitude of being a demanded solution only, of signifying that I ever have to destroy the barriers, that I ever have to reach beyond the limitation into utter infinitude, and that I ever find a new limit; a continual alternation takes place between negation and affirmation, an identity with self which again falls into negation, and from this negation is ever again restored. To speak of the bounds of human reason is, however, an unmeaning form of words. That the reason of the subject is limited is comprehensible from the nature of the case, but when we speak of Thought, infinitude is none other than one's own relation to self, and not to one's

limit; and the place in which man is infinite is Thought. Infinitude may then be likewise very abstract, and in this way it is also once more finite; but true infinitude remains in itself.

Fichte further deduces the ordinary conception thus: the fact that the ego in going forth at once finds its activity checked by a limitation, and returns once more into itself, brings about two opposite tendencies in me, between which I waver, and which I try to unite in the faculty of imagination. In order that a fixed determination may exist between the two, I have to make the limit a permanent one, and we have that in the understanding. All further determinations of the object are, as categories of the understanding, modes of synthesis; but each synthesis is a new contradiction. New mediations are thus once more necessary, and these are new determinations. Thus Fichte says: I can always continue to determine the non-ego, to make it my conception, *i.e.* to take from it its negation as regards me. I have to deal with my activity alone; but there is always an externality therein present which still remains, and which is not explained by my activity. This Beyond which alone remains to the undetermined ego Fichte calls the infinite check upon the ego, with which it ever has to deal, and beyond which it cannot get; thus the activity which proceeds into infinitude finds itself checked and driven back by this repulsive force, and then it reacts upon itself. "The ego in its self-determination has been considered both as determining and determined; if we reflect on the fact that the absolutely determined determining power must be an absolutely indeterminate, and further, that ego and non-ego are absolutely opposed to one another, in the one case ego is the indeterminate and in the other case non-ego."[393]

Inasmuch as the ego here makes the object its conception and negates it, this philosophy is Idealism, in which philosophy all the determinations of the object are ideal. Everything determinate which the ego possesses it has through its own positing; I even make a coat or a boot because I put them

on. There remains only the empty repulsive force, and that is the Kantian Thing-in-itself, beyond which even Fichte cannot get, even though the theoretic reason continues its determination into infinitude. “The ego as intelligence” ever “remains dependent on an undetermined non-ego; it is only through this that it is intelligence.”[394] The theoretic side is thus dependent. In it we have not therefore to deal with the truth in and for itself, but with a contingent, because ego is limited, not absolute, as its Notion demands: intelligence is not here considered as spirit which is free. This is Fichte’s standpoint as regards the theoretic side.

c. Practical reason comes next; the point of view from which it starts is that “The ego posits itself as determining the non-ego.” Now the contradiction has thus to be solved of ego being at home with itself, since it determines its Beyond. The ego is thus infinite activity, and, as ego = ego, the absolute ego, it is undoubtedly abstract. But in order to have a determination, a non-ego must exist; ego is thus activity, causality, the positing of the non-ego. But as with Kant sensuousness and reason remain opposed, the same contradiction is present here, only in a more abstract form, and not in the rude empiricism of Kant. Fichte here turns and twists in all sorts of ways, or he gives the opposition many different forms; the crudest form is that ego is posited as causality, for in it another is necessitated on which it exercises its activity. “The absolute ego has accordingly to be” now “the cause of the non-ego, *i.e.* only of that in the non-ego which remains when we abstract from all demonstrable forms of representation or conception — of that to which is ascribed the check given to the infinitely operative activity of the ego; for the fact that the intelligent ego is, in accordance with the necessary laws of the conception, the cause of the particular determinations of that which is conceived as such, is demonstrated in the theoretic science of knowledge.”[395] The limits of intelligence must be broken through, the ego must alone be active; the other

side, the infinite repulsion, must be removed, in order that the ego may be liberated.

"According to our hypothesis the ego must now posit a non-ego absolutely, and without any ground, *i.e.* absolutely and without any ground it must limit or in part not posit itself." This, indeed, it already does as intelligent. "It must therefore have the ground of not positing itself" only "in itself." The ego is, however, just the ego, it posits itself, "it must" therefore "have the principle of positing itself within it, and also the principle of not positing itself. Hence the ego in its essence would be contradictory and self-repellent; there would be in it a two-fold or contradictory principle, which assumption contradicts itself, for in that case there would be no principle within it. The ego would" consequently "not exist, for it would abrogate itself. All contradictions are reconciled through the further determination of contradictory propositions. The ego must be posited in one sense as infinite, and in another as finite. Were it to be posited as infinite and finite in one and the same sense, the contradiction would be insoluble; the ego would not be one but two. In so far as the ego posits itself as infinite, its activity is directed upon itself and on nothing else but itself. In so far as the ego posits limits, and itself in these limits, its activity is not exercised directly on itself, but on a non-ego which has to be placed in opposition," upon another and again upon another, and so on into infinitude; that is the object, and the activity of the ego "is objective activity."[396] In this way Fichte in the practical sphere also remains at opposition, only this opposition now has the form of two tendencies in the ego, both of which are said to be one and the same activity of the ego. I am called upon to proceed to determine the other in relation to which I am negative, the non-ego, in accordance with my freedom; it has indeed all determinations through the activity of the ego, but beyond my

determination the same non-ego ever continues to appear. The ego clearly posits an object, a point of limitation, but where the limitation is, is undetermined. I may transfer the sphere of my determination, and extend it to an infinite degree, but there always remains a pure Beyond, and the non-ego has no positive self-existent determination.

The last point in respect of the practical sphere is hence this, that the activity of the ego is a yearning or striving[397] — like the Kantian "ought"; Fichte treats this with great prolixity. The Fichtian philosophy consequently has the same standpoint as the Kantian; the ultimate is always subjectivity, as existent in and for itself. Yearning, according to Fichte, is divine; in yearning I have not forgotten myself, I have not forgotten that I possess a superiority in myself; and therefore it is a condition of happiness and satisfaction. This infinite yearning and desire has then been regarded as what is highest and most excellent in the Beautiful, and in religious feelings likewise; and with it is connected the irony of which we have spoken before (Vol. I. pp. 400, 401). In this return the ego is merely an effort, on its side it is fixed, and it cannot realize its endeavours. Striving is thus an imperfect or implicitly limited action. The ultimate result is consequently a "circle" which cannot be broken through, so that "the finite spirit must necessarily posit an absolute outside itself (a thing-in-itself), and yet on the other hand it must recognize that this same is only there for it (a necessary noumenon)."[398] To put it otherwise, we see the ego absolutely determined in opposition only, we see it only as consciousness and self-consciousness which does not get beyond this, and which does not reach so far as to Spirit. The ego is the absolute Notion in so far as it does not yet reach the unity of thought, or in this simplicity does not reach difference, and in motion does not have rest; that is to say, in so far as positing, or the pure activity of the ego, and setting in opposition, are not by it comprehended as the same. Or the ego does not comprehend the infinite repulsion, the non-ego; self-

consciousness determines the non-ego, but does not know how to make this Beyond its own.

The deficiency in the Fichtian philosophy is thus firstly that the ego retains the significance of the individual, actual self-consciousness, as opposed to that which is universal or absolute, or to the spirit in which it is itself a moment merely; for the individual self-consciousness simply signifies standing apart as far as another is concerned. Hence, if the ego was ever called absolute existence, the most terrible offence was given, because really the ego only came before us as signifying the individual subject as opposed to the universal.

In the second place, Fichte does not attain to the idea of Reason as the perfected, real unity of subject and object, or of ego and non-ego; it is only, as with Kant, represented as the thought of a union in a belief or faith, and with this Fichte likewise concludes (Grundlage der gesammten Wissenschaftslehre, p. 301). This he worked out in his popular writings. For because the ego is fixed in its opposition to the non-ego, and *is* only as being opposed, it becomes lost in that unity. The attainment of this aim is hence sent further and further back into the false, sensuous infinitude: it is a progression implying just the same contradiction as that found in Kant, and having no present actuality in itself; for the ego has all actuality in its opposition only. The Fichtian philosophy recognizes the finite spirit alone, and not the infinite; it does not recognize spirit as universal thought, as the Kantian philosophy does not recognize the not-true; or it is formal. The knowledge of absolute unity is apprehended as faith in a moral disposition of the world, an absolute hypothesis in accordance with which we have the belief that every moral action that we perform will have a good result.[399] As in Kant's case, this Idea belongs to universal thought. "In a word, when anything is apprehended it ceases to be God; and every conception of God that is set up is necessarily that of a false God. Religion is a practical faith

in the moral government of the world; faith in a supersensuous world belongs, according to our philosophy, to the immediate verities."[400] Fichte thus concludes with the highest Idea, with the union of freedom and nature, but a union of such a nature that, immediately regarded, it is not known; the opposition alone falls within consciousness. This union of faith he likewise finds in the Love of God. As believed and experienced, this form pertains to Religion, and not to Philosophy, and our only possible interest is to know this in Philosophy. But with Fichte it is still associated with a most unsatisfying externality of which the basis is the non-Idea, for the one determination is essential only because the other is so, and so on into infinitude. "The theory of knowledge is realistic — it shows that the consciousness of finite beings can only be explained by presupposing an independent and wholly opposite power, on which, in accordance with their empirical existence, they themselves are dependent. But it asserts nothing more than this opposed power, which by finite beings can merely be *felt* and not known. All possible determinations of this power or of this non-ego which can come forth into infinity in our consciousness, it pledges itself to deduce from the determining faculties of the ego, and it must actually be able to deduce these, so certainly as it is a theory of knowledge. This knowledge, however, is not transcendent but transcendental. It undoubtedly explains all consciousness from something independent of all consciousness, but it does not forget that this independent somewhat is again a product of its own power of thought, and consequently something dependent on the ego, in so far as it has to be there for the ego. Every thing is, in its ideality, dependent upon the ego; but in its reality even the ego is dependent. The fact that the finite spirit must posit for itself somewhat outside of itself, which last exists only for it, is that circle which it may infinitely extend but never break through." The further logical determination of the object is that which in subject and object is identical,

the true connection is that in which the objective is the possession of the ego; as thought, the ego in itself determines the object. But Fichte's theory of knowledge regards the struggle of the ego with the object as that of the continuous process of determining the object through the ego as subject of consciousness, without the identity of the restfully self-developing Notion.[401]

Thirdly, because the ego is thus fixed in its one-sidedness, there proceeds from it, as representing one extreme, the whole of the progress that is made in the content of knowledge; and the deduction of the philosophy of Fichte, cognition in its content and form, is a progression from certain determinations to others which do not turn back into unity, or through a succession of finitenesses which do not have the Absolute in them at all. The absolute point of view, like an absolute content, is wanting. Thus the contemplation of nature, for instance, is a contemplation of it as of pure finitenesses from the point of view of another, as though the organic body were regarded thus: "Consciousness requires a sphere entirely its own for its activity. This sphere is posited through an original, necessary activity of the ego, in which it does not know itself as free. It is a sensuous perception, a drawing of lines; the sphere of activity thereby becomes something extended in space. As quiescent, continuous, and yet unceasingly changing, this sphere is matter, which, as body, has a number of parts which in relation to one another are called limbs. The person can ascribe to himself no body without positing it as being under the influence of another person. But it is likewise essential that I should be able to check this same influence, and external matter is also posited as resisting my influences on it, *i.e.* as a tough, compact matter."[402] These tough matters must further be separated from one another — the different persons cannot hold together like one mass of dough. For "my body is my body and not that of another; it must further operate and be active without my working through it. It is only

through the operation of another that I can myself be active and represent myself as a rational being who can be respected by him. But the other being should treat me immediately as a rational being, I should be for him a rational being even before my activity begins. Or my form must produce an effect through its mere existence in space, without my activity, *i.e.* it must be visible. The reciprocal operation of rational beings must take place without activity; thus a subtle matter must be assumed in order that it may be modified by means of the merely quiescent form. In this way are deduced first Light and then Air."[403] This constitutes a very external manner of passing from one step to another, resembling the method of the ordinary teleology, which makes out, for instance, that plants and animals are given for the nourishment of mankind. This is how it is put: Man must eat, and thus there must be something edible — consequently plants and animals are at once deduced; plants must have their root in something, and consequently the earth is forthwith deduced. What is altogether lacking is any consideration of the object as what it is in itself; it is plainly considered only in relation to another. In this way the animal organism appears as a tough, tenacious matter which is "articulated" and can be modified; light is a subtle matter which is the medium of communication of mere existence, &c. — just as in the other case plants and animals are merely edible. As regards a philosophic consideration of the content there is nothing at all to be found.

Fichte likewise wrote both a Science of Morals and of Natural Rights, but he treats them as sciences pertaining to the understanding only, and his method of procedure is destitute of ideas and carried on by means of a limited understanding. The Fichtian deduction of the conceptions of justice and morality thus remains within the limitations and rigidity of self-consciousness, as against which Fichte's popular presentations of religion and morality present inconsistencies. The treatise on Natural Rights is a special failure, *e.g.* where he, as we have just seen (p. 502), deduces even

nature just as far as he requires it. The organization of the state which is described in Fichte's Science of Rights is furthermore as unspiritual as was the deduction of natural objects just mentioned, and as were many of the French constitutions which have appeared in modern times — a formal, external uniting and connecting, in which the individuals as such are held to be absolute, or in which Right is the highest principle. Kant began to ground Right upon Freedom, and Fichte likewise makes freedom the principle in the Rights of Nature; but, as was the case with Rousseau, it is freedom in the form of the isolated individual. This is a great commencement, but in order to arrive at the particular, they have to accept certain hypotheses. The universal is not the spirit, the substance of the whole, but an external, negative power of the finite understanding directed against individuals. The state is not apprehended in its essence, but only as representing a condition of justice and law, *i.e.* as an external relation of finite to finite. There are various individuals; the whole constitution of the state is thus in the main characterized by the fact that the freedom of individuals must be limited by means of the freedom of the whole.[404] The individuals always maintain a cold attitude of negativity as regards one another, the confinement becomes closer and the bonds more stringent as time goes on, instead of the state being regarded as representing the realization of freedom.

This philosophy contains nothing speculative, but it demands the presence of the speculative element. As the philosophy of Kant seeks in unity its Idea of the Supreme Good, wherein the opposites have to be united, so the Fichtian philosophy demands union in the ego and in the implicitude of faith; in this self-consciousness in all its actions makes its starting-point conviction, so that in themselves its actions may bring forth the highest end and realize the good. In the Fichtian philosophy nothing can be seen beyond the moment of self-consciousness, of self-conscious Being-

within-self, as in the philosophy of England we find expressed — in just as one-sided a way — the moment of Being-for-another, or of consciousness, and that not as a moment simply, but as the principle of the truth; in neither of the two is there the unity of both — or spirit.

Fichte's philosophy constitutes a significant epoch in Philosophy regarded in its outward form. It is from him and from his methods that abstract thought proceeds, deduction and construction. Hence with the Fichtian philosophy a revolution took place in Germany. The public had penetrated as far as the philosophy of Kant, and until the Kantian philosophy was reached the interest awakened by Philosophy was general; it was accessible, and men were curious to know about it, it pertained to the ordinary knowledge of a man of culture (*supra*, p. 218). Formerly men of business, statesmen, occupied themselves with Philosophy; now, however, with the intricate idealism of the philosophy of Kant, their wings droop helpless to the ground. Hence it is with Kant that we first begin to find a line of separation which parts us from the common modes of consciousness; but the result, that the Absolute cannot be known, has become one generally acknowledged. With Fichte the common consciousness has still further separated itself from Philosophy, and it has utterly departed from the speculative element therein present. For Fichte's ego is not merely the ego of the empiric consciousness, since general determinations of thought such as do not fall within the ordinary consciousness have likewise to be known and brought to consciousness; in this way since Fichte's time few men have occupied themselves with speculation. Fichte, it is true, in his later works especially, wrote with a view to meeting the popular ear as we may see in the "Attempt to force the reader into comprehension," but this end was not accomplished. The public was through the philosophy of Kant and Jacobi strengthened in its opinion — one which it accepted *utiliter* — that the knowledge of God is immediate, and that we know it from the beginning

and without requiring to study, and hence that Philosophy is quite superfluous.

2. Fichte's System in a Re-constituted Form.

The times called for life, for spirit. Now since mind has thus retreated within self-consciousness, but within self-consciousness as a barren ego, which merely gives itself a content or a realization through finitenesses and individualities which in and for themselves are nothing, the next stage is found in knowing this realization of self-consciousness in itself, in knowing the content in itself as a content which, penetrated throughout by spirit, is self-conscious and spiritual, or a spirit full of content. In his later popular works Fichte thus set forth faith, love, hope, religion, treating them without philosophic interest, and as for a general public: it was a philosophy calculated to suit enlightened Jews and Jewesses, councillors and Kotzebues. He places the matter in a popular form: "It is not the finite ego that is, but the divine Idea is the foundation of all Philosophy; everything that man does of himself is null and void. All existence is living and active in itself, and there is no other life than Being, and no other Being than God; God is thus absolute Being and Life. The divine essence likewise comes forth, revealing and manifesting itself — the world."[405] This immediate unity of the self-conscious ego and its content, or spirit, which merely has an intuition of its self-conscious life and knows it as the truth immediately, manifested itself subsequently in poetic and prophetic tendencies, in vehement aspirations, in excrescences which grew out of the Fichtian philosophy.

3. The more Important of the Followers of Fichte.

On the one hand, in respect of the content which the ego reaches in the philosophy of Fichte, the complete absence of spirituality, the woodenness,

and, to put it plainly, the utter foolishness therein evidenced, strike us too forcibly to allow us to remain at his standpoint; our philosophic perception likewise tells us of the one-sidedness and deficiencies of the principle, as also of the evident necessity that the content should prove to be what it is. But on the other hand self-consciousness was therein posited as reality or essence — not as a foreign, alien self-consciousness, but as ego — a signification which all possess, and which finds an answer in the actuality of all. The Fichtian standpoint of subjectivity has thus retained its character of being unphilosophically worked out, and arrived at its completion in forms pertaining to sensation which in part remained within the Fichtian principle, while they were in part the effort — futile though it was — to get beyond the subjectivity of the ego.

a. Friedrich von Schlegel.

In Fichte's case the limitation is continually re-appearing; but because the ego feels constrained to break through this barrier, it reacts against it, and gives itself a resting-place within itself; this last ought to be concrete, but it is a negative resting-place alone. This first form, Irony, has Friedrich von Schlegel as its leading exponent. The subject here knows itself to be within itself the Absolute, and all else to it is vain; all the conclusions which it draws for itself respecting the right and good, it likewise knows how to destroy again. It can make a pretence of knowing all things, but it only demonstrates vanity, hypocrisy, and effrontery. Irony knows itself to be the master of every possible content; it is serious about nothing, but plays with all forms. The other side is this, that subjectivity has cast itself into religious subjectivity. The utter despair in respect of thought, of truth, and absolute objectivity, as also the incapacity to give oneself any settled basis or spontaneity of action, induced the noble soul to abandon itself to feeling and to seek in Religion something fixed and steadfast; this steadfast basis,

this inward satisfaction, is to be found in religious sentiments and feelings. This instinct impelling us towards something fixed has forced many into positive forms of religion, into Catholicism, superstition and miracle working, in order that they may find something on which they can rest, because to inward subjectivity everything fluctuates and wavers. With the whole force of its mind subjectivity tries to apply itself to what is positively given, to bend its head beneath the positive, to cast itself, so to speak, into the arms of externality, and it finds an inward power impelling it so to do.

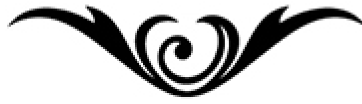
b. Schleiermacher.

On the other hand the ego finds in the subjectivity and individuality of the personal view of things the height of all its vanity — its Religion. All the various individualities have God within themselves. Dialectic is the last thing to arise and to maintain its place. As this is expressed for philosophic self-consciousness, the foreign intellectual world has lost all significance and truth for ordinary culture; it is composed of three elements, a deity pertaining to a time gone by, and individualized in space and existence, a world which is outside the actuality of self-consciousness, and a world which had yet to appear, and in which self-consciousness would first attain to its reality. The spirit of culture has deserted it, and no longer recognizes anything that is foreign to self-consciousness. In accordance with this principle, the spiritual living essence has then transformed itself into self-consciousness, and it thinks to know the unity of spirit immediately from itself, and in this immediacy to be possessed of knowledge in a poetic, or at least a prophetic manner. As regards the poetic manner, it has a knowledge of the life and person of the Absolute immediately, by an intuition, and not in the Notion, and it thinks it would lose the whole as whole, as a self-penetrating unity, were it not to express the same in poetic form; and what it thus expresses poetically is the intuition of the personal life of self-

consciousness. But the truth is absolute motion, and since it is a motion of forms and figures [Gestalten], and the universe is a kingdom of spirits, the Notion is the essence of this movement, and likewise of each individual form; it is its ideal form [Form] and not the real one, or that of figure [Gestalt]. In the latter case necessity is lost sight of; individual action, life and heart, remain within themselves, and undeveloped; and this poetry vacillates betwixt the universality of the Notion and the determinateness and indifference of the figure; it is neither flesh nor fish, neither poetry nor philosophy. The prophetic utterance of truths which claim to be philosophical, thus belongs to faith, to self-consciousness, which indeed perceives the absolute spirit in itself, but does not comprehend itself as self-consciousness, since it places absolute reality above Knowledge, beyond self-conscious reason, as was done by Eschenmayer and Jacobi. This uncomprehending, prophetic manner of speech affirms this or that respecting absolute existence as from an oracle, and requires that each man should find the same immediately in his own heart. The knowledge of absolute reality becomes a matter pertaining to the heart; there are a number of would-be inspired speakers, each of whom holds a monologue and really does not understand the others, excepting by a pressure of the hands and betrayal of dumb feeling. What they say is mainly composed of trivialities, if these are taken in the sense in which they are uttered; it is the feeling, the gesture, the fulness of the heart, which first gives them their significance; to nothing of more importance is direct expression given. They outbid one another in conceits of fancy, in ardent poetry. But before the Truth vanity turns pale, spitefully sneering it sneaks back into itself. Ask not after a criterion of the truth, but after the Notion of the truth in and for itself; on that fix your gaze. The glory of Philosophy is departed, for it presupposes a common ground of thoughts and principles — which is what science demands — or at least of opinions. But now particular subjectivity was

everything, each individual was proud and disdainful as regards all others. The conception of independent thought — as though there could be a thought which was not such (Vol. I. p. 60) — is very much the same; men have, it is said, to bring forth a particularity of their own, or else they have not thought for themselves. But the bad picture is that in which the artist shows himself; originality is the production of what is in its entirety universal. The folly of independent thought is that it results in each bringing forth something more preposterous than another.

c. Novalis.



Subjectivity signifies the lack of a firm and steady basis, but likewise the desire for such, and thus it evermore remains a yearning. These yearnings of a lofty soul are set forth in the writings of Novalis. This subjectivity does not reach substantiality, it dies away within itself, and the standpoint it adopts is one of inward workings and fine distinctions; it signifies an inward life and deals with the minutiæ of the truth. The extravagances of subjectivity constantly pass into madness; if they remain in thought they are whirled round and round in the vortex of reflecting understanding, which is ever negative in reference to itself.

d. Fries, Bouterweck, Krug.

Yet a last form of subjectivity is the subjectivity of arbitrary will and ignorance. It maintained this, that the highest mode of cognition is an immediate knowledge as a fact of consciousness; and that is so far right. The Fichtian abstraction and its hard understanding has a repellent effect on thought; slothful reason allowed itself to be told the result of the philosophy of Kant and Jacobi, and renounced all consistent thought, all construction. This arbitrariness gave itself entire liberty — the liberty of the *Tabagie* — but in doing so it regarded itself from a poetic or prophetic point of view, as

we have just seen (pp. 508, 509). Then it was both more sober and more prosaic, and thus brought the old logic and metaphysic once more into evidence, though with this modification that they are made facts of consciousness. Thus Fries turns back to the faith of Jacobi in the form of immediate judgments derived from reason, and dark conceptions incapable of utterance.[406] He wished to improve the critique of pure reason by apprehending the categories as facts of consciousness; anything one chooses can in such a case be introduced. Bouterweck speaks of "The virtue, the living nature of power; the fact that subject and object are regarded as one, that is as absolute virtue. With this absolute virtue we have all Being and action, namely the eternal, absolute and pure unity; in one word we have grasped the world within us and we have grasped ourselves in the world, and that indeed not through conceptions and conclusions, but directly through the power which itself constitutes our existence and our rational nature. To know the All, or indeed to know God in any way, is, however, impossible for any mortal."[407] Krug wrote a "Groundwork of Philosophy," setting forth a "Transcendental Synthesis — that is a transcendental realism and a transcendental idealism inseparably bound together," It is an "original, transcendental synthesis of the real and the ideal, the thinking subject and the corresponding outer world;" this transcendental synthesis must "be recognized and asserted without any attempt being made at explaining it."[408]

D. Schelling.

IT WAS SCHELLING, finally, who made the most important, or, from a philosophic point of view, the only important advance upon the philosophy of Fichte; his philosophy rose higher than that of Fichte, though undoubtedly it stood in close connection with it; indeed, he himself professes to be a Fichtian. Now the philosophy of Schelling from the first admitted the possibility of a knowledge of God, although it likewise started from the philosophy of Kant, which denies such knowledge. At the same time Schelling makes Jacobi's principle of the unity of thought and Being fundamental, although he begins to determine it more closely.[409] To him concrete unity is this, that the finite is no more true than the infinite, the subjective idea no more than objectivity, and that combinations in which both untruths are brought together in their independence in relation to one another, are likewise combinations of untruths merely. Concrete unity can only be comprehended as process and as the living movement in a proposition. This inseparability is in God alone; the finite, on the other hand, is that which has this separability within it. In so far as it is a truth it is likewise this unity, but in a limited sphere, and for that reason in the separability of both moments.

Frederick Wilhelm Joseph Schelling, born on the 27th January, 1775, at Schorndorf,[410] in Wurtemberg, studied in Leipzig and Jena, where he came to be on terms of great intimacy with Fichte. In the year 1807 he became secretary of the Academy of Science in Munich. We cannot with propriety deal fully with his life, for he is still living.[411]

Schelling worked out his philosophy in view of the public. The series of his philosophic writings also represents the history of his philosophic

development and the gradual process by which he raised himself above the Fichtian principle and the Kantian content with which he began. It does not thus contain a sequence of separately worked out divisions of Philosophy, but only successive stages in his own development. If we ask for a final work in which we shall find his philosophy represented with complete definiteness none such can be named. Schelling's first writings are still quite Fichtian, and it is only by slow degrees that he worked himself free of Fichte's form. The form of the ego has the ambiguity of being capable of signifying either the absolute Ego or God, or ego in my particularity;[412] this supplied the first stimulus to Schelling. His first and quite short work of four sheets which he wrote in 1795 at Tubingen, while still at the university, was called, "On the Possibility of any Form of Philosophy"; it contains propositions respecting the Fichtian philosophy only. The next work, "On the Ego as principle of Philosophy, or on the Unconditioned in Human Knowledge" (Tubingen, 1795), is likewise quite Fichtian; in this case, however, it is from a wider and more universal point of view, since the ego is therein grasped as an original identity.[413] We find, however, a summary of the Fichtian principle and the Kantian mode of presentation: "It is only by something being originally set in opposition to the ego, and by the ego being itself posited as the manifold (in time), that it is possible for the ego to get beyond the unity which belongs to it of merely being posited, and that, for example, it posits the same content on more than one occasion."[414] Schelling then passed on to natural philosophy, adopted Kantian forms and reflective determinations, such as those of repulsion and attraction, from Kant's "Metaphysics of Nature," and likewise dealt with quite empirical phenomena in expressions taken from Kant. All his first works on this subject come under this category, viz.: "Ideas towards a Philosophy of Nature," 1797; "On the World-Soul," 1798, the second edition of which possesses appendices which are entirely inconsistent with what goes before.

In the writings of Herder and Kielmeyer[415] we find sensibility, irritability, and reproduction dealt with, as also their laws, such as that the greater the sensibility the less the irritability, &c. — just as the powers or potencies were dealt with by Eschenmayer. It was only later on in relation to these that Schelling first apprehended nature in the categories of thought, and made general attempts of a more definite character in the direction of greater scientific development. It was only through what had been accomplished by these men that he was enabled to come into public notice so young. The spiritual and intellectual side, morality and the state, he represented on the other hand purely in accordance with Kantian principles: thus in his "Transcendental Idealism," although it was written from a Fichtian point of view, he goes no further than Kant did in his "Philosophy of Rights" and his work "On Eternal Peace." Schelling, indeed, later on published a separate treatise on Freedom, deeply speculative in character; this, however, remains isolated and independent, and deals with this one point alone; in Philosophy, however, nothing isolated can be worked out or developed. In the various presentations of his views Schelling on each occasion began again from the beginning, because, as we may see, what went before did not satisfy him; he has ever pressed on to seek a new form, and thus he has tried various forms and terminologies in succession without ever setting forth one complete and consistent whole. His principal works in this connection are the "First Sketch of a System of Natural Philosophy," 1799; the "System of Transcendental Idealism," 1800, one of his most carefully thought-out works; "Bruno, a Dialogue on the Divine and Natural Principle of Things," 1802; "Journal of Speculative Physics," 1801; "New Journal of Speculative Physics," 1802 *et* In the second number of the second volume of his "Journal of Speculative Physics," Schelling made the commencement of a detailed treatment of the whole of his philosophy. Here he likewise starts to a certain measure, though unconsciously, from the

Fichtian form of construction; but the idea is already present that nature equally with knowledge is a system of reason.

It is not feasible here to go into details respecting what is called the philosophy of Schelling, even if time permitted. For it is not yet a scientific whole organized in all its branches, since it rather consists in certain general elements which do not fluctuate with the rest of his opinions. Schelling's philosophy must still be regarded as in process of evolution, and it has not yet ripened into fruit;[416] we can hence give a general idea of it only.

When Schelling made his first appearance the demands put forward by Philosophy were as follows. With Descartes thought and extension were in some incomprehensible way united in God, with Spinoza it was as motionless substance; and beyond this point of view neither of them ever passed. Later on we saw the form develop, partly in the sciences and partly in the Kantian philosophy. Finally, in the Fichtian philosophy, the form was subjectivity on its own account, from which all determinations were held to develop. What is thus demanded is that this subjectivity of infinite form which we saw dying into irony or arbitrariness (pp. 507-510) should be delivered from its one-sidedness in order to be united with objectivity and substantiality. To put it otherwise, the substance of Spinoza should not be apprehended as the unmoved, but as the intelligent, as a form which possesses activity within itself of necessity, so that it is the forming power of nature, but at the same time knowledge and comprehension. This then is the object of Philosophy; it is not the formal union of Spinoza that is demanded, nor the subjective totality of Fichte, but totality with the infinite form. We see this developing in the philosophy of Schelling.

1. In one of his earlier writings, the "System of Transcendental Idealism," which we shall consider first of all, Schelling represented transcendental philosophy and natural philosophy as the two sides of scientific knowledge. Respecting the nature of the two, he expressly

declared himself in this work, where he once more adopts a Fichtian starting-point: “All knowledge rests on the harmony of an objective with a subjective.” In the common sense of the words this would be allowed; absolute unity, where the Notion and the reality are undistinguished in the perfected Idea, is the Absolute alone, or God; all else contains an element of discord between the objective and subjective. “We may give the name of nature to the entire objective content of our knowledge; the entire subjective content, on the other hand, is called the ego or intelligence.” They are in themselves identical and presupposed as identical. The relation of nature to intelligence is given by Schelling thus: “Now if all knowledge has two poles which mutually presuppose and demand one another, there must be two fundamental sciences, and it must be impossible to start from the one pole without being driven to the other.” Thus nature is impelled to spirit, and spirit to nature; either may be given the first place, and both must come to pass. “If the objective is made the chief,” we have the natural sciences as result, and “the necessary tendency,” the end, “of all natural science thus is to pass from nature to intelligence. This is the meaning of the effort to connect natural phenomena with theory. The highest perfection of natural science would be the perfect spiritualization of all natural laws into laws of intuitive perception and thought. The phenomenal (the material element) must entirely disappear, and laws (the formal element) alone remain. Hence it comes to pass that the more that which is in conformity with law breaks forth in nature itself, the more the outward covering disappears; the phenomena themselves become more spiritual, and finally cease altogether. The perfect theory of nature would be that by which the whole of nature should be resolved into an intelligence. The dead and unconscious products of nature are only abortive attempts on the part of nature to reflect itself, but the so-called dead nature is really an immature,” torpid, fossilized “intelligence”; it is implicit only, and thus remains in externality; “hence in

its phenomena," even though "still unconsciously, the character of intelligence shines through. Its highest end, which is to become object to itself, is first attained by nature" (instead of nature we should call it the Idea of nature), "through its highest and ultimate reflection, which is none other than man, or, more generally, it is that which we call reason, through which nature for the first time returns completely within itself, and whereby it becomes evident that nature is originally identical with what is known in us as intelligence or the conscious. Through this tendency to make nature intelligent natural science becomes the philosophy of nature." The intelligent character of nature is thus spoken of as a postulate of science. The other point of view is "to give the subjective the foremost place." Thus here "the problem is how to add an objective element agreeing with it. To start from the subjective as from the first and absolute, and to make the objective arise from it," signifies a new departure; its consideration forms the content of true Transcendental Philosophy, or, as Schelling himself now named this science, "the other science fundamental to Philosophy." The organ of transcendental philosophy is the subjective, the production of inward action. Production and reflection upon this production, the unconscious and conscious in one, is the æsthetic act of the imagination.[417] Thus these two separate processes are as a whole very clearly expressed: the process which leads from nature to the subject, and that leading from the ego to the object. But the true process could only be traced out by means of logic, for it contains pure thoughts; but the logical point of view was what Schelling never arrived at in his presentation of things.

a. In respect of the ego, as principle of the transcendental philosophy, Schelling sets to work in the same way as did Fichte, inasmuch as he begins from the fact of knowledge "in which the content is conditioned through the form, and the form through the content"; this is formal A = A. But does A exist? The ego is "the point where subject and object are one in their

unmediated condition”; the ego is just Ego = Ego, subject-object; and that is the act of self-consciousness wherein I am for myself object to myself. In self-consciousness there is not to be found a distinction between me and anything else; what are distinguished are directly identical, and there is so far nothing at all in opposition to this self-consciousness. How the case stands with regard to external objects is the question which must be decided later, in the further course of development. It is only the Notion of the ego which is to be laid hold of: “The Notion of the ego, that is the act whereby thought in general becomes object to itself, and the ego itself (the object) are absolutely one; independently of this act the ego is nothing.” It is the act whereby thought makes itself objective, and wherein the ego is brought into harmony with the objective, with thought; and from this standpoint it had to be demonstrated how the ego makes its way to objectivity. “The ego, as pure act, as pure action, is not objective in knowledge itself, for the reason that it is the principle of all knowledge. If it is to be object of knowledge, this must come to pass through a very different kind of knowledge than the ordinary.” The immediate consciousness of this identity is intuition, but inwardly it becomes “intellectual intuition”; it “is a knowledge which is the production of its object: sensuous intuition or perception is perception of such a nature that the perception itself appears to be different from what is perceived. Now intellectual intuition is the organ of all transcendental thought,” the act of pure self-consciousness generally. “The ego is nothing else than a process of production which ever makes itself its own object. Science can start from nothing objective,” but from “the non-objective which itself becomes object” as an “original duplicity. Idealism is the mechanism of the origination of the objective world from the inward principle of spiritual activity.”[418]

On the one hand Schelling’s system is related to the philosophy of Fichte, and, on the other hand, he, like Jacobi, makes his principle

immediate knowledge — the intelligent intuitive perception which all who wish to philosophize must have. But what comes next is that its content is no longer the indeterminate, the essence of essence, but likewise the Absolute, God, the absolutely self-existent, though expressed as concrete, *i.e.* as mediating itself within itself, as the absolute unity or indifference of subjective and objective. Intellectual intuition is the Fichtian imagination oscillating between two different points. We have already spoken above (p. 417) of the *form* of intellectual intuition; it is the most convenient manner of asserting knowledge respecting — anything one likes. But the immediate knowledge of God as spiritual is only in the consciousness of Christian nations, and not for others. This immediate knowledge appears to be still more contingent as the intellectual intuition of the concrete, or the identity of subjectivity and objectivity. This intuition is intellectual indeed, because it is a rational intuition, and as knowledge it is likewise absolutely one with the object of knowledge. But this intuition, although itself knowledge, is not as yet known; it is the unmediated, the postulated. As it is in this way an immediate we must possess it, and what may be possessed may likewise not be possessed. Thus since the immediate presupposition in Philosophy is that individuals have the immediate intuition of this identity of subjective and objective, this gave the philosophy of Schelling the appearance of indicating that the presence of this intuition in individuals demanded a special talent, genius, or condition of mind of their own, or as though it were generally speaking an accidental faculty which pertained to the specially favoured few. For the immediate, the intuitively perceived, is in the form of an existent, and is not thus an essential; and whoever does not understand the intellectual intuition must come to the conclusion that he does not possess it. Or else, in order to understand it, men must give themselves the trouble of possessing it; but no one can tell whether he has it or not — not even from understanding it, for we may merely think we

understand it. Philosophy, however, is in its own nature capable of being universal; for its ground-work is thought, and it is through thought that man is man. Schelling's principle is thus indeed clearly a universal; but if a definite intuition, a definite consciousness is demanded, such as the consciousness or intuition of the identity of subjective and objective, this determinate particular thought is not as yet to be found in it.

It was, however, in this form of knowledge of the absolute as concrete, and, further, in the form of unity of subjective and objective, that Philosophy as represented by Schelling more especially marked itself off from the ordinary conceiving consciousness and its mode of reflection. Even less than Fichte did Schelling attain to popularity (*supra*, pp. 504, 505), for the concrete in its nature is directly speculative. The concrete content, God, life, or whatever particular form it has, is indeed the content and object of natural consciousness; but the difficulty lies in bringing what is contained in the concrete into concrete thought in accordance with its different determinations, and in laying hold of the unity. It pertains to the standpoint of the understanding to divide and to distinguish, and to maintain the finite thought-determinations in their opposition; but Philosophy demands that these different thoughts should be brought together. Thought begins by holding apart infinite and finite, cause and effect, positive and negative; since this is the region of reflecting consciousness, the old metaphysical consciousness was able to take part in so doing: but the speculative point of view is to have this opposition before itself and to reconcile it. With Schelling the speculative form has thus again come to the front, and philosophy has again obtained a special character of its own; the principle of Philosophy, rational thought in itself, has obtained the form of thought. In the philosophy of Schelling the content, the truth, has once more become the matter of chief importance, whereas in the Kantian philosophy the point of interest was more especially stated to be the necessity for

investigating subjective knowledge. This is the standpoint of Schelling's philosophy in its general aspects.

b. Since in further analysis the distinction between subject and object comes into view and is accepted, there follows the relationship of the ego to its other; with Fichte that forms the second proposition, in which the self-limitation of the ego is posited. The ego posits itself in opposition to itself, since it posits itself as conditioned by the non-ego; that is the infinite repulsion, for this conditionment is the ego itself. Schelling, on the one hand, says: "The ego is unlimited as the ego only in so far as it is limited," as it relates to the non-ego. Only thus does consciousness exist, self-consciousness is a barren determination; through its intuition of self the ego becomes finite to itself. "This contradiction only allows itself to be dissolved by the ego becoming in this finitude infinite to itself, *i.e.* by its having an intuitive perception of itself as an infinite Becoming." The relation of the ego to itself and to the infinite check or force of repulsion is a constant one. On the other hand it is said: "The ego is limited only in so far as it is unlimited;" this limitation is thus necessary in order to be able to get beyond it. The contradiction which we find here remains even if the ego always limits the non-ego. "Both activities — that which makes for infinitude, the limitable, real, objective activity, and the limiting and ideal, mutually presuppose one another. Idealism reflects merely on the one, realism on the other, transcendental idealism on both."[419] All this is a tangled mass of abstractions.

c. "Neither through the limiting activity nor through the limited does the ego arrive at self-consciousness. There consequently is a third activity, compounded from the other two, through which the ego of self-consciousness arises; this third is that which oscillates between the two — the struggle between opposing tendencies." There is essential relation only,

relative identity; the difference therein present thus ever remains. "This struggle cannot be reconciled by one such action, but only by an infinite succession of such," *i.e.* the reconciliation of the opposition between the two tendencies of the ego, the inward and the outward, is, in the infinite course of progression, only an apparent one. In order that it may be complete, the whole inward and outward nature must be presented in all its details: but Philosophy can only set forth the epochs which are most important. "If all the intermediate links in sensation could be set forth, that would necessarily lead us to a deduction of all the qualities in nature, which last is impossible." Now this third activity, which contains the union directly in itself, is a thought in which particularity is already contained. It is the intuitive understanding of Kant, the intelligent intuition or intuitively perceiving intelligence; Schelling, indeed, definitely names this absolute unity of contradictions intellectual intuition. The ego here is not one-sided in regard to what is different; it is identity of the unconscious and the conscious, but not an identity of such a nature that its ground rests on the ego itself.[420]

This ego must be the absolute principle: "All philosophy starts from a principle which as absolute identity is non-objective." For if it is objective, separation is at once posited and it is confronted by another; but the principle is the reconciliation of the opposition, and therefore in and for itself it is non-objective. "Now how should a principle such as this be called forth to consciousness and understood, as is required if it is the condition attached to the comprehension of all philosophy? That it can no more be comprehended through Notions [Begriffe] than set forth, requires no proof." Notion to Schelling signifies a category of the ordinary understanding; Notion is, however, the concrete thought which in itself is infinite. "There thus remains nothing more than that it should be set forth in an immediate intuition. If there were such an intuition which had as object the absolutely

identical, that which in itself is neither subjective nor objective, and if for such, which," however, "can be an intellectual intuition only, one could appeal to immediate experience," the question would be: "How can this intuition be again made objective, *i.e.* how can it be asserted without doubt that it does not rest on a subjective deception, if there is not a universal objectivity in that intuition, which is recognized by all?" This intellectual principle in itself should thus be given in an experience so that men may be able to appeal to it. "The objectivity of intellectual intuition is art. The work of art alone reflects to me what is otherwise reflected through nothing — that absolute identical which has already separated itself in the ego itself." The objectivity of identity and the knowledge of the same is art; in one and the same intuition the ego is here conscious of itself and unconscious.[421] This intellectual intuition which has become objective is objective sensuous intuition — but the Notion, the comprehended necessity, is a very different objectivity.

Thus a principle is presupposed both for the content of philosophy and for subjective philosophizing: on the one hand it is demanded that the attitude adopted should be one of intellectual intuition, and, on the other hand, this principle has to be authenticated, and this takes place in the work of art. This is the highest form of the objectivization of reason, because in it sensuous conception is united with intellectuality, sensuous existence is merely the expression of spirituality. The highest objectivity which the subject attains, the highest identity of subjective and objective, is that which Schelling terms the power of imagination. Art is thus comprehended as what is inmost and highest, that which produces the intellectual and real in one, and philosophizing is conceived as this genius of art. But art and power of imagination are not supreme. For the Idea, spirit, cannot be truly given expression to in the manner in which art expresses its Idea. This last is always a method pertaining to intuitive perception; and on account of this

sensuous form of existence the work of art cannot correspond to the spirit. Thus because the point last arrived at is designated as the faculty of imagination, as art, even in the subject this is a subordinate point of view, and thus in itself this point is not the absolute identity of subjectivity and objectivity. In subjective thought, rational, speculative thought is thus indeed demanded, but if this appears false to you nothing farther can be said than that you do not possess intellectual intuition. The proving of anything, the making it comprehensible, is thus abandoned; a correct apprehension of it is directly demanded, and the Idea is thus assertorically pre-established as principle. The Absolute is the absolute identity of subjective and objective, the absolute indifference of real and ideal, of form and essence, of universal and particular; in this identity of the two there is neither the one nor the other. But the unity is not abstract, empty, and dry; that would signify logical identity, classification according to something common to both, in which the difference remains all the while outside. The identity is concrete: it is subjectivity as well as objectivity; the two are present therein as abrogated and ideal. This identity may easily be shown in the ordinary conception: the conception, we may for example say, is subjective; it has, too, the determinate content of exclusion in reference to other conceptions; nevertheless, the conception is simple — it is one act, one unity.

What is lacking in Schelling's philosophy is thus the fact that the point of indifference of subjectivity and objectivity, or the Notion of reason, is absolutely presupposed, without any attempt being made at showing that this is the truth. Schelling often uses Spinoza's form of procedure, and sets up axioms. In philosophy, when we desire to establish a position, we demand proof. But if we begin with intellectual intuition, that constitutes an oracle to which we have to give way, since the existence of intellectual intuition was made our postulate. The true proof that this identity of subjective and objective is the truth, could only be brought about by means

of each of the two being investigated in its logical, *i.e.* essential determinations; and in regard to them, it must then be shown that the subjective signifies the transformation of itself into the objective, and that the objective signifies its not remaining such, but making itself subjective. Similarly in the finite, it would have to be shown that it contained a contradiction in itself, and made itself infinite; in this way we should have the unity of finite and infinite. In so doing, this unity of opposites is not asserted beforehand, but in the opposites themselves it is shown that their truth is their unity, but that each taken by itself is one-sided — that their difference veers round, casting itself headlong into this unity — while the understanding all the time thinks that in these differences it possesses something fixed and secure. The result of thinking contemplation would in this former case be that each moment would secretly make itself into its opposite, the identity of both being alone the truth. The understanding certainly calls this transformation sophistry, humbug, juggling, and what-not. As a result, this identity would, according to Jacobi, be one which was no doubt conditioned and of set purpose produced. But we must remark that a one-sided point of view is involved in apprehending the result of development merely as a result; it is a process which is likewise mediation within itself, of such a nature that this mediation is again abrogated and asserted as immediate. Schelling, indeed, had this conception in a general way, but he did not follow it out in a definite logical method, for with him it remained an immediate truth, which can only be verified by means of intellectual intuition. That is the great difficulty in the philosophy of Schelling. And then it was misunderstood and all interest taken from it. It is easy enough to show that subjective and objective are different. Were they not different, nothing could be made of them any more than of A = A; but they are in opposition *as one*. In all that is finite, an identity is present, and this alone is actual; but besides the fact that the finite is this identity, it is

also true that it is the absence of harmony between subjectivity and objectivity, Notion and reality; and it is in this that finitude consists. To this principle of Schelling's, form, or necessity, is thus lacking, it is only asserted. Schelling appears to have this in common with Plato and the Neo-Platonists, that knowledge is to be found in the inward intuition of eternal Ideas wherein knowledge is unmediated in the Absolute. But when Plato speaks of this intuition of the soul, which has freed itself from all knowledge that is finite, empirical, or reflected, and the Neo-Platonists tell of the ecstasy of thought in which knowledge is the immediate knowledge of the Absolute, this definite distinction must be noticed, viz., that with Plato's knowledge of the universal, or with his intellectuality, wherein all opposition as a reality is abrogated, dialectic is associated, or the recognized necessity for the abrogation of these opposites; Plato does not begin with this, for with him the movement in which they abrogate themselves is present. The Absolute is itself to be looked at as this movement of self-abrogation; this is the only actual knowledge and knowledge of the Absolute. With Schelling this idea has, however, no dialectic present in it whereby those opposites may determine themselves to pass over into their unity, and in so doing to be comprehended.

2. Schelling begins with the idea of the Absolute as identity of the subjective and objective, and accordingly there evinced itself in the presentations of his system which followed, the further necessity of proving this idea; this he attempted to do in the two Journals of Speculative Physics. But if that method be once adopted, the procedure is not immanent development from the speculative Idea, but it follows the mode of external reflection. Schelling's proofs are adduced in such an exceedingly formal manner that they really invariably presuppose the very thing that was to be proved. The axiom assumes the main point in question, and all the rest follows as a matter of course. Here is an instance: "The innermost essence

of the Absolute can only be thought of as identity absolute, altogether pure and undisturbed. For the Absolute is only absolute, and what is thought in it is necessarily and invariably the same, or in other words, is necessarily and invariably absolute. If the idea of the Absolute were a general Notion" (or conception), "this would not prevent a difference being met with in it, notwithstanding this unity of the absolute. For things the most different are yet in the Notion always one and identical, just as a rectangle, a polygon and a circle are all figures. The possibility of the difference of all things in association with perfect unity in the Notion lies in the manner in which the particular in them is combined with the universal. In the Absolute this altogether disappears, because it pertains to the very idea of the Absolute that the particular in it is also the universal, and the universal the particular; and further that by means of this unity form and existence are also one in it. Consequently, in regard to the Absolute, from the fact of its being the Absolute, there likewise follows the absolute exclusion from its existence of all difference, and that at once."[422]

In the former of the two above-named works, the "Journal of Speculative Physics," Schelling began by again bringing forward the Substance of Spinoza, simple, absolute Existence, inasmuch as he makes his starting-point the absolute identity of the subjective and objective. Here, like Spinoza, he employed the method of geometry, laying down axioms and proving by means of propositions, then going on to deduce other propositions from these, and so on. But this method has no real application to philosophy. Schelling at this point laid down certain forms of difference, to which he gave the name of potencies, adopting the term from Eschenmayer, who made use of it (p. 514);[423] they are ready-made differences, which Schelling avails himself of. But philosophy must not take any forms from other sciences, as here from mathematics. With

Schelling, the leading form is that which was brought into remembrance again by Kant, the form of triplicity as first, second, and third potency.

Schelling, like Fichte, begins with I = I, or with the absolute intuition, expressed as proposition or definition of the Absolute, that "Reason is the absolute indifference of subject and object": so that it is neither the one nor the other, for both have in it their true determination; and their opposition, like all others, is utterly done away with. The true reality of subject and object is placed in this alone, that the subject is not posited in the determination of subject against object, as in the philosophy of Fichte; it is not determined as in itself existent, but as subject-object, as the identity of the two; in the same way the object is not posited according to its ideal determination as object, but in as far as it is itself absolute, or the identity of the subjective and objective. But the expression "indifference" is ambiguous, for it means indifference in regard to both the one and the other; and thus it appears as if the content of indifference, the only thing which makes it concrete, were indifferent. Schelling's next requirement is that the subject must not be hampered with reflection; that would be bringing it under the determination of the understanding, which, equally with sensuous perception, implies the separateness of sensuous things. As to the form of its existence, absolute indifference is with Schelling posited as A = A; and this form is for him the knowledge of absolute identity, which, however, is inseparable from the Being or existence of the same.[424]

Thus, therefore, opposition, as form and reality or existence, no doubt appears in this Absolute, but it is determined as a merely relative or unessential opposition: "Between subject and object no other than quantitative difference is possible. For no qualitative difference as regards the two is thinkable," because absolute identity "is posited as subject and object only as regards the form of its Being, not as regards its existence. There is consequently only a quantitative difference left," *i.e.* only that of

magnitude: and yet difference must really be understood as qualitative, and must thus be shown to be a difference which abrogates itself. This quantitative difference, says Schelling, is the form *actu*: “The quantitative difference of subjective and objective is the basis of all finitude. Each determined potency marks a determined quantitative difference of the subjective and objective. Each individual Being is the result of a quantitative difference of subjectivity and objectivity. The individual expresses absolute identity under a determined form of Being:” so that each side is itself a relative totality, A = B, and at the same time the one factor preponderates in the one, and the other factor in the other, but both remain absolute identity.[425] This is insufficient, for there are other determinations; difference is undoubtedly qualitative, although this is not the absolute determination. Quantitative difference is no true difference, but an entirely external relation; and likewise the preponderance of subjective and objective is not a determination of thought, but a merely sensuous determination.

The Absolute itself, in so far as the positing of difference is taken into account, is defined by Schelling as the quantitative indifference of subjective and objective: in respect to absolute identity no quantitative difference is thinkable. “Quantitative difference is only possible outside of absolute identity, and outside of absolute totality. There is nothing in itself outside of totality, excepting by virtue of an arbitrary separation of the individual from the whole. Absolute identity exists only under the form of the quantitative indifference of subjective and objective.” Quantitative difference, which appears outside of absolute identity and totality, is therefore, according to Schelling, in itself absolute identity, and consequently thinkable only under the form of the quantitative indifference of the subjective and objective. “This opposition does not therefore occur in itself, or from the standpoint of speculation. From this standpoint A exists

just as much as B does; for A like B is the whole absolute identity, which only exists under the two forms, but under both of them alike. Absolute identity is the universe itself. The form of its Being can be thought of under the image of a line," as shown by the following scheme:

$$\frac{\overset{+}{A} = B \qquad\qquad A = \overset{+}{B}}{A = A}$$

"in which the same identity is posited in each direction, but with A or B preponderating in opposite directions."[426] If we go into details, the main points from an elementary point of view are the following.

The first potency is that the first quantitative difference of the Absolute, or "the first relative totality is matter. Proof: A = B is not anything real either as relative identity or as relative duplicity. As identity A = B, in the individual as in the whole, can be expressed only by the line," — the first dimension. "But in that line A is posited throughout as existent," *i.e.* it is at the same time related to B. "Therefore this line presupposes A = B as relative totality throughout; relative totality is therefore the first presupposition, and if relative identity exists, it exists only through relative totality," — this is duplicity, the second dimension. "In the same way relative duplicity presupposes relative identity. Relative identity and duplicity are contained in relative totality, not indeed *actu*, but yet *potentia*. Therefore the two opposites must mutually extinguish each other in a third" dimension. "Absolute identity as the immediate basis of the reality of A and B in matter, is the force of gravitation. If A preponderates we have the force of attraction, if B preponderates we have that of expansion. The quantitative positing of the forces of attraction and expansion passes into the infinite; their equilibrium exists in the whole, not in the individual."[427] From matter as the first indifference in immediacy Schelling now passes on to further determinations.

The second potency (A^2) is light, this identity itself posited as existent; in so far as A = B, A^2 is also posited. The same identity, "posited under the form of relative identity," *i.e.* of the polarity which we find appearing "in A and B, is the force of cohesion. Cohesion is the impression made on matter by the self-hood" of light "or by personality, whereby matter first emerges as particular out of the universal identity, and raises itself into the realm of form." Planets, metals and other bodies form a series which under the form of dynamic cohesion expresses particular relations of cohesion, in which on the one hand contraction preponderates, and on the other hand expansion. These potencies appear with Schelling as north and south, east and west polarity: their developments further appear as north-west, south-east, &c. He counts as the last potency Mercury, Venus, the Earth, &c. He continues: "Cohesion outside of the point of indifference I term passive. Towards the negative side" (or pole) "fall some of the metals which stand next to iron, after them the so-called precious metals," then the "diamond, and lastly carbon, the greatest passive cohesion. Towards the positive side, again, some metals fall, in which the cohesive nature of iron gradually diminishes," *i.e.* approaches disintegration, and lastly "disappears in nitrogen." Active cohesion is magnetism, and the material universe is an infinite magnet. The magnetic process is difference in indifference, and indifference in difference, and therefore absolute identity as such. The indifference point of the magnet is the "neither nor" and the "as well as"; the poles are potentially the same essence, only posited under two factors which are opposed. Both poles depend "only upon whether + or - preponderates"; they are not pure abstractions. "In the total magnet the empirical magnet is the indifference point. The empirical magnet is iron. All bodies are mere metamorphoses of iron — they are potentially contained in iron. Every two different bodies which touch each other set up mutually in each other relative diminution and increase of cohesion. This mutual

alteration of cohesion by means of the contact of two different bodies is electricity; the cohesion-diminishing factor +E is the potency of hydrogen,-E is the potency of oxygen. The totality of the dynamic process is represented only by the chemical process.”[428]

“By the positing of the dynamic totality the addition of light is directly posited as a product. The expression, the total product, therefore signifies light combined with the force of gravitation; by the positing of the relative totality of the whole potency, the force of gravity is directly reduced to the mere form of the Being of absolute identity.” Thus is the third potency (A^3), the organism.[429] Schelling launched out into too many individual details, if he desired to indicate the construction of the whole universe. On the one hand, however, he did not complete this representation, and on the other hand, he has confined himself mainly to implicit existence, and has mixed therewith the formalism of external construction according to a presupposed scheme. In this representation he advanced only as far as the organism, and did not reach the presentation of the other side of knowledge, *i.e.* the philosophy of spirit. Schelling began time after time, in accordance with the idea implied in this construction, to work out the natural universe, and especially the organism. He banishes all such meaningless terms as perfection, wisdom, outward adaptability; or, in other words, the Kantian formula, that a thing appears so and so to our faculty of knowledge, is transformed by him into this other formula, that such and such is the constitution of Nature. Following up Kant’s meagre attempt at demonstrating spirit in nature, he devoted special attention to inaugurating anew this mode of regarding nature, so as to recognize in objective existence the same schematism, the same rhythm, as is present in the ideal. Hence nature represents itself therein not as something alien to spirit, but as being in its general aspect a projection of spirit into an objective mode.

We have further to remark that Schelling by this theory became the originator of modern Natural Philosophy, since he was the first to exhibit Nature as the sensuous perception or the expression of the Notion and its determinations. Natural Philosophy is no new science; we met with it continually — in the works of Aristotle, for instance, and elsewhere. English Philosophy is also a mere apprehension in thought of the physical; forces, laws of Nature, are its fundamental determinations. The opposition of physics and Natural Philosophy is therefore not the opposition of the unthinking and the thinking view of Nature; Natural Philosophy means, if we take it in its whole extent, nothing else than the thoughtful contemplation of Nature; but this is the work of ordinary physics also, since its determinations of forces, laws, &c., are thoughts. The only difference is that in physics thoughts are formal thoughts of the understanding, whose material and content cannot, as regards their details, be determined by thought itself, but must be taken from experience. But concrete thought contains its determination and its content in itself, and merely the external mode of appearance pertains to the senses. If, then, Philosophy passes beyond the form of the understanding, and has apprehended the speculative Notion, it must alter the determinations of thought, the categories of the understanding regarding Nature. Kant was the first to set about this; and Schelling has sought to grasp the Notion of Nature, instead of contenting himself with the ordinary metaphysics of the same. Nature is to him nothing but the external mode of existence as regards the system of thought-forms, just as mind is the existence of the same system in the form of consciousness. That for which we have to thank Schelling, therefore, is not that he brought thought to bear on the comprehension of Nature, but that he altered the categories according to which thought applied itself to Nature; he introduced forms of Reason, and applied them — as he did the form of the syllogism in magnetism, for instance — in place of the ordinary

categories of the understanding. He has not only shown these forms in Nature, but has also sought to evolve Nature out of a principle of this kind.

In the "Further Exposition of the System of Philosophy" which the "New Journal for Speculative Physics" furnishes, Schelling chose other forms; for, by reason of incompletely developed form and lack of dialectic, he had recourse to various forms one after another, because he found none of them sufficient. Instead of the equilibrium of subjectivity and objectivity, he now speaks of the identity of existence and form, of universal and particular, of finite and infinite, of positive and negative, and he defines absolute indifference sometimes in one and sometimes in another form of opposition, just according to chance. All such oppositions may be employed; but they are only abstract, and refer to different stages in the development of the logical principle itself. Form and essence are distinguished by Schelling in this way, that form, regarded on its own account, is the particular, or the emerging of difference, subjectivity. But real existence is absolute form or absolute knowledge immediately in itself, a self-conscious existence in the sense of thinking knowledge, just as with Spinoza it had the form of something objective or in thought. Speculative Philosophy is to be found in this assertion, not that it asserts an independent philosophy, for it is purely organization; knowledge is based on the Absolute. Thus Schelling has again given to transcendental Idealism the significance of absolute Idealism. This unity of existence and form is thus, according to Schelling, the Absolute; or if we regard reality as the universal, and form as the particular, the Absolute is the absolute unity of universal and particular, or of Being and knowledge. The different aspects, subject and object, or universal and particular, are only ideal oppositions; they are in the Absolute entirely and altogether one. This unity as form is intellectual intuition, which posits Thinking and Being as absolutely alike, and as it formally expresses the Absolute, it becomes at the same time the expression of its essence. He who has not the power of

imagination, whereby he may represent this unity to himself, is deficient in the organ of Philosophy. But in this consists the true absoluteness of all and each, that the one is not recognized as universal, and the other as particular, but the universal in this its determination is recognized as unity of the universal and particular, and in like manner the particular is recognized as the unity of both. Construction merely consists in leading back everything determined and particular into the Absolute, or regarding it as it is in absolute unity; its determinateness is only its ideal moment, but its truth is really its Being in the Absolute. These three moments or potencies — that of the passing of existence (the infinite) into form (the finite), and of form into existence (which are both relative unities), and the third, the absolute unity, thus recur anew in each individual. Hence Nature, the real or actual aspect, as the passing of existence into form or of the universal into the particular, itself again possesses these three unities in itself, and in the same way the ideal aspect does so; therefore each potency is on its own account once more absolute. This is the general idea of the scientific construction of the universe — to repeat in each individual alike the triplicity which is the scheme of the whole, thereby to show the identity of all things, and in doing so to regard them in their absolute essence, so that they all express the same unity.[430]

The more detailed explanation is extremely formal: "Existence passes into form — this taken by itself being the particular (the finite) — by means of the infinite being added to it; unity is received into multiplicity, indifference into difference." The other assertion is: "Form passes into existence by the finite being received into the infinite, difference into indifference." But passing into and receiving into are merely sensuous expressions. "Otherwise expressed, the particular becomes absolute form by the universal becoming one with it, and the universal becomes absolute

existence by the particular becoming one with it. But these two unities, as in the Absolute, are not outside of one another, but in one another, and therefore the Absolute is absolute indifference of form and existence," as unity of this double passing-into-one. "By means of these two unities two different potencies are determined, but in themselves they are both the exactly equal roots of the Absolute."[431] That is a mere assertion, the continual return after each differentiation, which is perpetually again removed out of the Absolute.

"Of the first absolute transformation there are copies in phenomenal Nature; therefore Nature, regarded in itself, is nothing else than that first transformation as it exists in the absolute (unseparated from the other). For by means of the infinite passing into the finite, existence passes into form; since then form obtains reality only by means of existence, existence, when it has passed into form without form having (according to the assumption) similarly passed into existence, can be represented only as potentiality or ground of reality, but not as indifference of possibility and actuality. But that which may be described thus, namely as existence, in so far as that is mere ground of reality, and therefore has really passed into form, although form has not in turn passed into it, is what presents itself as Nature. — Existence makes its appearance in form, but in return form also makes its appearance in existence; this is the other unity," that of mind. "This unity is established by the finite being received into the infinite. At this point form, as the particular, strikes into existence, and itself becomes absolute. Form which passes into existence places itself as absolute activity and positive cause of reality in opposition to the existence which passes into form, and which appears only as ground. The passing of absolute form into existence is what we think of as God, and the images or copies of this transformation are in the ideal world, which is therefore in its implicitude the other unity."[432] Each of these two transformations, then, is the whole totality, not,

however, posited and not appearing as totality, but with the one or the other factor preponderating; each of the two spheres has, therefore, in itself again these differences, and thus in each of them the three potencies are to be found.

The ground or basis, Nature as basis merely, is matter, gravity, as the first potency; this passing of form into existence is in the actual world universal mechanism, necessity. But the second potency is "the light which shineth in darkness, form which has passed into existence. The absolute unification of the two unities in actuality, so that matter is altogether form, and form is altogether matter, is organism, the highest expression of Nature as it is in God, and of God as He is in Nature, in the finite." On the ideal side "Knowledge is the essence of the Absolute brought into the daylight of form; action is a transformation of form, as the particular, into the essence of the Absolute. As in the real world form that is identified with essence appears as light, so in the ideal world God Himself appears in particular manifestation as the living form which has emerged in the passing of form into essence, so that in every respect the ideal and real world are again related as likeness and symbol. The absolute unification of the two unities in the ideal, so that material is wholly form and form wholly material, is the work of art; and that secret hidden in the Absolute which is the root of all reality comes here into view, in the reflected world itself, in the highest potency and highest union of God and Nature as the power of imagination." On account of that permeation art and poetry therefore hold the highest rank in Schelling's estimation. But art is the Absolute in sensuous form alone. Where and what could the work of art be, which should correspond to the Idea of the spirit? "The universe is formed in the Absolute as the most perfect organic existence and the most perfect work of art: for Reason, which recognizes the Absolute in it, it possesses absolute truth; for the imagination, which represents the Absolute in it, it possesses absolute

Beauty. Each of these expresses the very same unity," regarded "from different sides; and both arrive at the absolute indifference point in the recognition of which lies both the beginning and the aim of real knowledge."[433] This highest Idea, these differences, are grasped as a whole in a very formal manner only.

3. The relation of Nature to Spirit, and to God, the Absolute, has been stated by Schelling elsewhere, *i.e.* in his later expositions, as follows: he defines the existence of God as Nature — in so far as God constitutes Himself its ground or basis, as infinite perception — and Nature is thus the negative moment in God, since intelligence and thought exist only by means of the opposition of one Being. For in one of his writings, directed on some particular occasion against Jacobi, Schelling explains himself further with regard to the nature of God and His relation to Nature. He says: "God, or more properly the existence which is God, is ground: He is ground of Himself as a moral Being. But" then "it is ground that He makes Himself" — not cause. Something must precede intelligence, and that something is Being— "since thought is the exact opposite of Being. That which is the beginning of an intelligence cannot be in its turn intelligent, since there would otherwise be no distinction; but it cannot be absolutely unintelligent, for the very reason that it is the potentiality of an intelligence. It will accordingly be something between these, *i.e.* it will operate with wisdom, but as it were with an innate, instinctive, blind, and yet unconscious wisdom; just as we often hear those who are under a spell uttering words full of understanding, but not uttering them with comprehension of their meaning, but as it were owing to an inspiration." God, therefore, as this ground of Himself, is Nature — Nature as it is in God; this is the view taken of Nature in Natural Philosophy.[434] But the work of the Absolute is to abrogate this ground, and to constitute itself Intelligence. On this account Schelling's philosophy has later been termed a

Philosophy of Nature, and that in the sense of a universal philosophy, while at first Natural Philosophy was held to be only a part of the whole.

It is not incumbent on us here to give a more detailed account of Schelling's philosophy, or to show points in the expositions hitherto given by him which are far from satisfactory. The system is the latest form of Philosophy which we had to consider, and it is a form both interesting and true. In the first place special emphasis, in dealing with Schelling, must be laid on the idea that he has grasped the true as the concrete, as the unity of subjective and objective. The main point in Schelling's philosophy thus is that its interest centres round that deep, speculative content, which, as content, is the content with which Philosophy in the entire course of its history has had to do. The Thought which is free and independent, not abstract, but in itself concrete, comprehends itself in itself as an intellectually actual world; and this is the truth of Nature, Nature in itself. The second great merit possessed by Schelling is to have pointed out in Nature the forms of Spirit; thus electricity, magnetism, &c., are for him only external modes of the Idea. His defect is that this Idea in general, its distinction into the ideal and the natural world, and also the totality of these determinations, are not shown forth and developed as necessitated in themselves by the Notion. As Schelling has not risen to this point of view, he has misconceived the nature of thought; the work of art thus becomes for him the supreme and only mode in which the Idea exists for spirit. But the supreme mode of the Idea is really its own element; thought, the Idea apprehended, is therefore higher than the work of art. The Idea is the truth, and all that is true is the Idea; the systematizing of the Idea into the world must be proved to be a necessary unveiling and revelation. With Schelling, on the other hand, form is really an external scheme, and his method is the artificial application of this scheme to external objects. This externally applied scheme takes the place of dialectic progress; and this is the special

reason why the philosophy of Nature has brought itself into discredit, that it has proceeded on an altogether external plan, has made its foundation a ready-made scheme, and fitted into it Nature as we perceive it. These forms were potencies with Schelling, but instead of mathematical forms or a type of thought like this, by some other men sensuous forms have been taken as basis, just as were sulphur and mercury by Jacob Boehme. For instance, magnetism, electricity, and chemistry have been defined to be the three potencies in Nature, and thus in the organism reproduction has been termed chemistry; irritability, electricity; and sensibility, magnetism.[435] In this way there has crept into Natural Philosophy the great formalism of representing everything as a series, which is a superficial determination without necessity, since instead of Notions we find formulas. Brilliant powers of imagination are displayed, such as were exhibited by Görres. This mistake of applying forms which are taken from one sphere of Nature to another sphere of the same has been carried a long way; Oken, for example, calls wood-fibres the nerves and brain of the plant, and is almost crazy on the subject. Philosophy would in this way become a play of mere analogical reflections; and it is not with these but with thoughts that we have to do. Nerves are not thoughts, any more than such expressions as pole of contraction, of expansion, masculine, feminine, &c. The formal plan of applying an external scheme to the sphere of Nature which one wishes to observe, is the external work of Natural Philosophy, and this scheme is itself derived from the imagination. That is a most false mode of proceeding; Schelling took advantage of it to some extent, others have made a complete misuse of it. All this is done to escape thought; nevertheless, thought is the ultimate simple determination which has to be dealt with.

It is therefore of the greatest importance to distinguish Schelling's philosophy, on the one hand, from that imitation of it which throws itself into an unspiritual farrago of words regarding the Absolute; and, on the

other hand, from the philosophy of those imitators, who, owing to a failure to understand intellectual intuition, give up comprehension, and with it the leading moment of knowledge, and speak from so-called intuition, *i.e.* they take a glance at the thing in question, and having fastened on it some superficial analogy or definition, they fancy they have expressed its whole nature, while in point of fact they put an end to all capacity for attaining to scientific knowledge. This whole tendency places itself, in the first place, in opposition to reflective thought, or to progress in fixed, steadfast, immovable Notions. But instead of remaining in the Notion and recognizing it as the unresting ego, they have lighted on the opposite extreme of passive intuition, of immediate Being, of fixed implicitude; and they think that they can make up for the lack of fixity by superficial observation, and can render this observation intellectual by determining it once more by some fixed Notion or other; or they bring their minds to bear on the object of consideration by saying, for instance, that the ostrich is the fish among birds, because he has a long neck — fish becomes a general term, but not a Notion. This whole mode of reasoning, which has forced its way into natural history and natural science, as well as into medicine, is a miserable formalism, an irrational medley of the crudest empiricism with the most superficial ideal determinations that formalism ever descended to. The philosophy of Locke is not so crude as it is, for it is not a whit better in either its content or its form, and it is combined with foolish self-conceit into the bargain. Philosophy on this account sank into general and well-deserved contempt, such as is for the most part extended to those who assert that they have a monopoly of philosophy. Instead of earnestness of apprehension and circumspection of thought, we find in them a juggling with idle fancies, which pass for deep conceptions, lofty surmises, and even for poetry; and they think they are right in the centre of things when they are only on the surface. Five-and-twenty years ago[436] the case was the same

with poetic art; a taste for ingenious conceits took possession of it, and the effusions of its poetic inspiration came forth blindly from itself, shot out as from a pistol. The results were either crazy ravings, or, if they were not ravings, they were prose so dull that it was unworthy of the name of prose. It is just the same in the later philosophies. What is not utterly senseless drivel about the indifference-point and polarity, about oxygen, the holy, the infinite, &c., is made up of thoughts so trivial that we might well doubt our having correctly apprehended their meaning, in the first place because they are given forth with such arrogant effrontery, and in the second place because we cannot help trusting that what was said was not so trivial as it seems. As in the Philosophy of Nature men forgot the Notion and proceeded in a dead unspiritual course, so here they lose sight of spirit entirely. They have strayed from the right road; for by their principle, Notion and perception are one unity, but in point of fact this unity, this spirit, itself emerges in immediacy, and is therefore in intuitive perception, and not in the Notion.

E. Final Result.

THE PRESENT STANDPOINT of philosophy is that the Idea is known in its necessity; the sides of its diremption, Nature and Spirit, are each of them recognized as representing the totality of the Idea, and not only as being in themselves identical, but as producing this one identity from themselves; and in this way the identity is recognized as necessary. Nature, and the world or history of spirit, are the two realities; what exists as actual Nature is an image of divine Reason; the forms of self-conscious Reason are also the forms of Nature. The ultimate aim and business of philosophy is to reconcile thought or the Notion with reality. It is easy from subordinate standpoints to find satisfaction in modes of intuitive perception and of feeling. But the deeper the spirit goes within itself, the more vehement is the opposition, the more abundant is the wealth without; the depth is to be measured by the greatness of the craving with which spirit seeks to find itself in what lies outside of itself. We saw the thought which apprehends itself appearing; it strove to make itself concrete within itself. Its first activity is formal; Aristotle was the first to say that νοῦς is the thought of thought. The result is the thought which is at home with itself, and at the same time embraces the universe therein, and transforms it into an intelligent world. In apprehension the spiritual and the natural universe are interpenetrated as one harmonious universe, which withdraws into itself, and in its various aspects develops the Absolute into a totality, in order, by the very process of so doing, to become conscious of itself in its unity, in Thought. Philosophy is thus the true theodicy, as contrasted with art and religion and the feelings which these call up — a reconciliation of spirit,

namely of the spirit which has apprehended itself in its freedom and in the riches of its reality.

To this point the World-spirit has come, and each stage has its own form in the true system of Philosophy; nothing is lost, all principles are preserved, since Philosophy in its final aspect is the totality of forms. This concrete idea is the result of the strivings of spirit during almost twenty-five centuries of earnest work to become objective to itself, to know itself:

Tantæ molis erat, se ipsam cognoscere mentem.

All this time was required to produce the philosophy of our day; so tardily and slowly did the World-spirit work to reach this goal. What we pass in rapid review when we recall it, stretched itself out in reality to this great length of time. For in this lengthened period, the Notion of Spirit, invested with its entire concrete development, its external subsistence, its wealth, is striving to bring spirit to perfection, to make progress itself and to develop from spirit. It goes ever on and on, because spirit is progress alone. Spirit often seems to have forgotten and lost itself, but inwardly opposed to itself, it is inwardly working ever forward (as when Hamlet says of the ghost of his father, "Well said, old mole! canst work i' the ground so fast?"[437]), until grown strong in itself it bursts asunder the crust of earth which divided it from the sun, its Notion, so that the earth crumbles away. At such a time, when the encircling crust, like a soulless decaying tenement, crumbles away, and spirit displays itself arrayed in new youth, the seven league boots are at length adopted. This work of the spirit to know itself, this activity to find itself, is the life of the spirit and the spirit itself. Its result is the Notion which it takes up of itself; the history of Philosophy is a revelation of what has been the aim of spirit throughout its history; it is therefore the world's history in its innermost signification. This work of the human spirit in the recesses of thought is parallel with all the stages of reality; and therefore no philosophy oversteps its own time. The importance

which the determinations of thought possessed is another matter, which does not belong to the history of Philosophy. These Notions are the simplest revelation of the World spirit: in their more concrete form they are history.

We must, therefore, in the first place not esteem lightly what spirit has won, namely its gains up to the present day. Ancient Philosophy is to be reverenced as necessary, and as a link in this sacred chain, but all the same nothing more than a link. The present is the highest stage reached. In the second place, all the various philosophies are no mere fashionable theories of the time, or anything of a similar nature; they are neither chance products nor the blaze of a fire of straw, nor casual eruptions here and there, but a spiritual, reasonable, forward advance; they are of necessity one Philosophy in its development, the revelation of God, as He knows Himself to be. Where several philosophies appear at the same time, they are different sides which make up one totality forming their basis; and on account of their one-sidedness we see the refutation of the one by the other. In the third place we do not find here feeble little efforts to establish or to criticize this or that particular point; instead of that, each philosophy sets up a new principle of its own, and this must be recognized.

If we glance at the main epochs in the whole history of Philosophy, and grasp the necessary succession of stages in the leading moments, each of which expresses a determinate Idea, we find that after the Oriental whirl of subjectivity, which attains to no intelligibility and therefore to no subsistence, the light of thought dawned among the Greeks.

1. The philosophy of the ancients had the absolute Idea as its thought; and the realization or reality of the same consisted in comprehending the existing present world, and regarding it as it is in its absolute nature. This philosophy did not make its starting-point the Idea itself, but proceeded from the objective as from something given, and transformed the same into the Idea; the Being of Parmenides.

2. Abstract thought, νοῦς, became known to itself as universal essence or existence, not as subjective thought; the Universal of Plato.

3. In Aristotle the Notion emerges, free and unconstrained, as comprehending thought, permeating and spiritualizing all the forms which the universe contains.

4. The Notion as subject, its independence, its inwardness, abstract separation, is represented by the Stoics, Epicureans and Sceptics: here we have not the free, concrete form, but universality abstract and in itself formal.

5. The thought of totality, the intelligible world, is the concrete Idea as we have seen it with the Neo-Platonists. This principle is ideality generally speaking, which is present in all reality, but not the Idea which knows itself: this is not reached until the principle of subjectivity, individuality, found a place in it, and God as spirit became actual to Himself in self-consciousness.

6. But it has been the work of modern times to grasp this Idea as spirit, as the Idea that knows itself. In order to proceed from the conscious Idea to the self-conscious, we must have the infinite opposition, namely the fact that the Idea has come to the consciousness of being absolutely sundered in twain. As spirit had the thought of objective existence, Philosophy thus perfected the intellectuality of the world, and produced this spiritual world as an object existing beyond present reality, like Nature, — the first creation of spirit. The work of the spirit now consisted in bringing this Beyond back to reality, and guiding it into self-consciousness. This is accomplished by self-consciousness thinking itself, and recognizing absolute existence to be the self-consciousness that thinks itself. With Descartes pure thought directed itself on that separation which we spoke of above. Self-consciousness, in the first place, thinks of itself as consciousness; therein is contained all objective reality, and the positive, intuitive reference of its

reality to the other side. With Spinoza Thought and Being are opposed and yet identical; he has the intuitive perception of substance, but the knowledge of substance in his case is external. We have here the principle of reconciliation taking its rise from thought as such, in order to abrogate the subjectivity of thought: this is the case in Leibnitz's monad, which possesses the power of representation.

7. In the second place, self-consciousness thinks of itself as being self-consciousness; in being self-conscious it is independent, but still in this independence it has a negative relation to what is outside self-consciousness. This is infinite subjectivity, which appears at one time as the critique of thought in the case of Kant, and at another time, in the case of Fichte, as the tendency or impulse towards the concrete. Absolute, pure, infinite form is expressed as self-consciousness, the Ego.

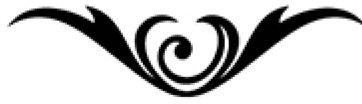
8. This is a light that breaks forth on spiritual substance, and shows absolute content and absolute form to be identical; — substance is in itself identical with knowledge. Self-consciousness thus, in the third place, recognizes its positive relation as its negative, and its negative as its positive, — or, in other words, recognizes these opposite activities as the same, *i.e.* it recognizes pure Thought or Being as self-identity, and this again as separation. This is intellectual perception; but it is requisite in order that it should be in truth intellectual, that it should not be that merely immediate perception of the eternal and the divine which we hear of, but should be absolute knowledge. This intuitive perception which does not recognize itself is taken as starting-point as if it were absolutely presupposed; it has in itself intuitive perception only as immediate knowledge, and not as self-knowledge: or it knows nothing, and what it perceives it does not really know, — for, taken at its best, it consists of beautiful thoughts, but not knowledge.

But intellectual intuition is knowledge, since, in the first place, in spite of the separation of each of the opposed sides from the other, all external reality is known as internal. If it is known according to its essence, as it is, it shows itself as not existing of itself, but as essentially consisting in the movement of transition. This Heraclitean or Sceptical principle, that nothing is at rest, must be demonstrated of each individual thing; and thus in this consciousness — that the essence of each thing lies in determination, in what is the opposite of itself — there appears the apprehended unity with its opposite. Similarly this unity is, in the second place, to be recognized even in its essence; its essence as this identity is, in the same way, to pass over into its opposite, or to realize itself, to become for itself something different; and thus the opposition in it is brought about by itself. Again, it may be said of the opposition, in the third place, that it is not in the Absolute; this Absolute is existence, the eternal, &c. This is, however, itself an abstraction in which the Absolute is apprehended in a one-sided manner only, and the opposition is apprehended only as ideal (*supra*, p. 536); but in fact it is form, as the essential moment of the movement of the Absolute. This Absolute is not at rest, and that opposition is not the unresting Notion; for the Idea, unresting though it is, is yet at rest and satisfied in itself. Pure thought has advanced to the opposition of the subjective and objective; the true reconciliation of the opposition is the perception that this opposition, when pushed to its absolute extreme, resolves itself; as Schelling says, the opposites are in themselves identical — and not only in themselves, but eternal life consists in the very process of continually producing the opposition and continually reconciling it. To know opposition in unity, and unity in opposition — this is absolute knowledge; and science is the knowledge of this unity in its whole development by means of itself.

This is then the demand of all time and of Philosophy. A new epoch has arisen in the world. It would appear as if the World-spirit had at last

succeeded in stripping off from itself all alien objective existence, and apprehending itself at last as absolute Spirit, in developing from itself what for it is objective, and keeping it within its own power, yet remaining at rest all the while. The strife of the finite self-consciousness with the absolute self-consciousness, which last seemed to the other to lie outside of itself, now comes to an end. Finite self-consciousness has ceased to be finite; and in this way absolute self-consciousness has, on the other hand, attained to the reality which it lacked before. This is the whole history of the world in general up to the present time, and the history of Philosophy in particular, the sole work of which is to depict this strife. Now, indeed, it seems to have reached its goal, when this absolute self-consciousness, which it had the work of representing, has ceased to be alien, and when spirit accordingly is realized as spirit. For it becomes such only as the result of its knowing itself to be absolute spirit, and this it knows in real scientific knowledge. Spirit produces itself as Nature, as the State; nature is its unconscious work, in the course of which it appears to itself something different, and not spirit; but in the State, in the deeds and life of History, as also of Art, it brings itself to pass with consciousness; it knows very various modes of its reality, yet they are only modes. In scientific knowledge alone it knows itself as absolute spirit; and this knowledge, or spirit, is its only true existence. This then is the standpoint of the present day, and the series of spiritual forms is with it for the present concluded.

At this point I bring this history of Philosophy to a close. It has been my desire that you should learn from it that the history of Philosophy is not a blind collection of fanciful ideas, nor a fortuitous progression. I have rather sought to show the necessary development of the successive philosophies from one another, so that the one of necessity presupposes another preceding it. The general result of the history of Philosophy is this: in the first place, that throughout all time there has been only one Philosophy, the



contemporary differences of which constitute the necessary aspects of the one principle; in the second place, that the succession of philosophic systems is not due to chance, but represents the necessary succession of stages in the development of this science; in the third place, that the final philosophy of a period is the result of this development, and is truth in the highest form which the self-consciousness of spirit affords of itself. The latest philosophy contains therefore those which went before; it embraces in itself all the different stages thereof; it is the product and result of those that preceded it. We can now, for example, be Platonists no longer. Moreover we must raise ourselves once for all above the pettinesses of individual opinions, thoughts, objections, and difficulties; and also above our own vanity, as if our individual thoughts were of any particular value. For to apprehend the inward substantial spirit is the standpoint of the individual; as parts of the whole, individuals are like blind men, who are driven forward by the indwelling spirit of the whole. Our standpoint now is accordingly the knowledge of this Idea as spirit, as absolute Spirit, which in this way opposes to itself another spirit, the finite, the principle of which is to know absolute spirit, in order that absolute spirit may become existent for it. I have tried to develop and bring before your thoughts this series of successive spiritual forms pertaining to Philosophy in its progress, and to indicate the connection between them. This series is the true kingdom of spirits, the only kingdom of spirits that there is — it is a series which is not a multiplicity, nor does it even remain a series, if we understand thereby that one of its members merely follows on another; but in the very process of coming to the knowledge of itself it is transformed into the moments of the one Spirit, or the one self-present Spirit. This long procession of spirits is formed by the individual pulses which beat in its life; they are the organism of our substance, an absolutely necessary progression, which expresses nothing less than the nature of spirit itself, and which lives in us

all. We have to give ear to its urgency — when the mole that is within forces its way on — and we have to make it a reality. It is my desire that this history of Philosophy should contain for you a summons to grasp the spirit of the time, which is present in us by nature, and — each in his own place — consciously to bring it from its natural condition, *i.e.* from its lifeless seclusion, into the light of day.

I have to express my thanks to you for the attention with which you have listened to me while I have been making this attempt; it is in great measure due to you that my efforts have met with so great a measure of success. And it has been a source of pleasure to myself to have been associated with you in this spiritual community; I ought not to speak of it as if it were a thing of the past, for I hope that a spiritual bond has been knit between us which will prove permanent. I bid you a most hearty farewell.

(The closing lecture of the series was given on the 22nd March, 1817; on the 14th March, 1818; on the 12th August, 1819; on the 23rd March, 1821; on the 30th March, 1824; on the 28th March, 1828; and on the 26th March, 1830.)

[75] Jacobi: Werke, Vol. IV. Section II. pp. 7-18; Tennemann, Vol. IX. pp. 391-394; Giordano Bruno: De la causa, principio et uno, Dialog. II. (Opere pubbl. da Ad. Wagner, Vol. I.), pp. 235-243.

[76] Jacobi: Werke, Vol. IV. Section II. pp. 19-23, 28-31; Tennemann, Vol. IX. pp. 394-396, 398, 399; Giordano Bruno: De la causa, principio et uno, Dial. III. pp. 251-257; Dial. IV. pp. 269-274.

[77] Jacobi: Werke, Vol. IV. Section II. pp. 23-25; Tennemann, Vol. IX. p. 396; Giordano Bruno: De la causa, principio et uno, Dial. III. pp. 260, 261.

[78] Jacobi: Werke, Vol. IV. Section II. pp. 25, 26; Tennemann, Vol. IX. p. 397; Giordano Bruno: De la causa, principio et uno, Dial. III. p. 261.

[79] Jacobi: Werke, Vol. IV. Section II. pp. 32, 45; Tennemann, Vol. IX. pp. 399, 403, 404; Giordano Bruno: De la causa, principio et uno, Dial. IV. p. 275; Dial. V. p. 291.

[80] Jordanus Brunus: De Minimo, pp. 10, 16-18; Jacobi: Werke, Vol. IV. Section II. pp. 34-39; Tennemann, Vol. IX. pp. 400-402; Giordano Bruno: De la causa, principio et uno, Dial. V. pp. 281-284. — On this opposition of the minimum and the maximum Bruno wrote several special works, for example, De triplici Minimo et Mensura libri V. Francofurti apud Wechelium et Fischer, 1591, 8; the text is hexameters, with notes and scholia; Buhle gives the title as De Minimo libri V. Another work bears the title: De Monade, Numero et figura liber; Item De Innumerabilibus, Immenso et Infigurabili: seu de Universo et Mundis libri VIII. Francof. 1591, 8.

[81] Bruno wrote many such topico-mnemonic works, of which the earliest are the following: Philotheus Jordanus Brunus Nolanus De compendiosa architectura et complemento artis Lullii, Paris. ap. Æg. Gorbinum, 1582. 12. — J. Brunus Nol. De Umbris idearum, implicantibus Artem quærendi, &c., Paris. ap. eund. 1582. 8. The second part has the title: Ars memoriæ. — Ph. Jord. Bruni Explicatio XXX sigillorum &c. Quibus adjectus est Sigillus sigillorum, &c. It is evident from the dedication that Bruno published this work in England, therefore between 1582 and 1585. — Jordanus Brunus De Lampade combinatoria Lulliana, Vitebergæ 1587. 8. In the same place he wrote De Progressu et lampade venatoria Logicorum, Anno 1587, which he dedicated to the Chancellor of the Wittenberg University. — Jordanus Brunus De Specierum scrutinio et lampade combinatoria Raym. Lullii, Pragæ, exc. Georg. Nigrinus 1588. 8; also printed in the works of Raymund Lullius. — Also De imaginum, signorum et idearum compositione Libri III. Francofurti ap. Jo. Wechel. et Petr. Fischer. 1591. 8.

[250] Leibnitzii Principia philosophiæ, § 8, 9, p. 21; Oper. T. II. P. I. pp. 128, 129, § 4, 5: Il n'y a point deux individus indiscernables. Un gentilhomme d'esprit de mes amis, en parlant avec moi en présence de Mad. l'Electrice dans le jardin de Herrenhausen, crut qu'il trouverait bien deux feuilles entièrement semblables. Mad. l'Electrice l'en défia, et il courut longtemps en vain pour en chercher. Deux gouttes d'eau ou de lait regardées par le microscope se trouveront discernables. C'est un argument contre les Atomes (Recueil, T. I. p. 50). — Cf. Hegel's Werke, Vol. IV. p. 45.

Lectures on the Proofs of the Existence of God

Translated by Ebenezer Brown Speirs

CONTENTS

AMPLIFICATION OF THE ONTOLOGICAL PROOF IN THE LECTURES ON THE PHILOSOPHY OF RELIGION FOR THE YEAR 1831.

Portrait engraving of Hegel in an ornate frame, c. 1890

FIRST LECTURE

These Lectures are devoted to the consideration of the proofs of the existence of God. The occasion for them is this. I had at first to make up my mind to give only one set of lectures in this summer session on philosophical knowledge as a whole, and then afterwards I felt I would like to add a second set on at least one separate subject of knowledge. I have therefore chosen a subject which is connected with the other set of lectures which I gave on logic, and constitutes, not in substance, but in form, a kind of supplement to that set, inasmuch as it is concerned with only a particular aspect of the fundamental conceptions of logic. These lectures are therefore chiefly meant for those of my hearers who were present at the others, and to them they will be most easily intelligible.

But inasmuch as the task we have set ourselves is to consider the proofs of the existence of God, it would appear as if only one aspect of the matter belongs to the subject of logic, namely, the nature of proof. The other, again, the content, which is God Himself, belongs to a different sphere, that of religion, and to the consideration of it by thought, to the philosophy of religion. In point of fact, it is a portion of this branch of knowledge which has to be set apart and treated by itself in these lectures. In what follows it will more clearly be seen what relation this part bears to the entirety of the doctrine of religion; and further, that this doctrine in so far as it is scientific, and what belongs to the sphere of logic, do not fall outside one another to the extent that would appear from the first statement of our aim, and that what is logical does not constitute the merely formal side, but, in fact, occupies the very centre point of the content.

The first thing we encounter when we seek to make a beginning with the execution of our design is the general, and, so far as this design is concerned, repugnant, point of view of the prepossessions of present-day culture. If the object, God, is in itself capable of producing exaltation of mind by its very name, and of stirring our soul to its innermost depths, our lofty expectation may just as quickly die away when we reflect that it is the proofs of the existence of God with which we are about to concern ourselves. For the proofs of the existence of God are to such an extent fallen into discredit that they pass for something antiquated, belonging to the metaphysics of days gone by; a barren desert, out of which we have escaped and brought ourselves back to a living faith; the region of arid Understanding, out of which we have once more raised ourselves to the warm feeling of religion. The attempt to renovate, by means of new applications and artifices of an acute Understanding, those rotten props of our belief that there is a God, which have passed for proofs, or to improve the places which have become weak through attacks and counter-proofs, could of itself gain no favour merely by its good intention. For it is not this or that proof, or this or that form and way of putting it, that has lost its weight, but the very proving of religious truth has so much lost credit with the mode of thought peculiar to our time that the impossibility of such proof is already a generally accepted opinion. Nay more, it has come to be regarded as irreligious to place confidence in such reasoned knowledge, and to seek by such a path to reach a sure conviction regarding God and His nature, or even regarding His mere existence. This business of proof, therefore, is so much out of date, that the proofs themselves are barely even historically known here and there; and even to theologians, that is to say, people who desire to have a scientific acquaintance with religious truths, they are sometimes unknown.

The proofs of the existence of God have originated in the necessity of satisfying thought and reason. But this necessity has assumed, in modern culture, quite a different position from that which it had formerly, and those points of view must first of all be considered which have presented themselves in this reference. Yet since they are known in their general aspects, and this is not the place to follow them back to their foundations, we need only recall them, and, in fact, limit ourselves to the form which they assume within the sphere of Christianity. It is in this region that the conflict between faith and reason in Man himself first finds a basis, and that doubt enters his soul, and can reach the fearful height of depriving him of all peace. Thought must indeed touch the earlier religions of imagination, as we may shortly call them; it must turn itself with its opposite principles directly against their sensuous pictures and all else in them. The contradictions, the strife and enmity which have thus arisen belong to the external history of philosophy. But the collisions between philosophy and religion here get the length of hostility merely, and have not come to be that inner division of mind and feeling, such as we see in Christianity, where the two sides which come into contradiction get possession of the depth of the Spirit as their single and consequently common source, and in this position, bound together in their contradiction, are able to disturb this spot itself, the Spirit in its inmost nature. The expression “faith” is reserved for Christianity; we do not speak of Greek or Egyptian faith, or of a faith in Zeus or Apis. Faith expresses the inwardness of certainty, and certainty of the deepest and most concentrated kind, as distinguished from all other opinion, conception, persuasion, or volition. This inwardness, at once as being what is deepest and at the same time most abstract, comprises thought itself; a contradiction of this faith by thought is therefore the most painful of all divisions in the depths of the Spirit.

Yet such misery is happily, if we may so express ourselves, not the only form in which the relation of faith and knowledge is to be found. On the contrary, this relation presents itself in a peaceful form, in the conviction that revelation, faith, positive religion, and, on the other hand, reason and thought in general, must not be in contradiction, and not only that they may be in harmony, but also that God does not so contradict Himself in His works, cannot so contradict Himself, as that the human Spirit in its essence, in its thinking reason, in that which it must have come from the very first to regard as divine in itself, could get into conflict with what has come to it through greater enlightenment about the nature of God and Man's relation to that nature. During the whole of the Middle Ages, theology was understood to mean nothing else than a scientific knowledge of Christian truths, that is to say, a knowledge essentially connected with philosophy. The Middle Ages were far enough away from taking the historical knowledge of faith for scientific knowledge; in the Fathers and in what may be reckoned generally as historical material, they sought only authorities, edification, and information on the doctrines of the Church. The opposite tendency is simply to search out the human origin of the articles of faith by the historical treatment of the older evidences and works of every kind, and in this way to reduce them to the minimum of their most primitive form. This form must be regarded as wholly unfruitful in deeper knowledge and development, because it is in contradiction with that Spirit, which, after the removal of that primitive form as something immediately present, had been poured out on the adherents of these doctrines, in order to lead them now, for the first time, into all truth. The tendency here described was unknown in these times. In the belief in the unity of this Spirit with itself, the whole of these doctrines, even those which are most abstruse for reason, are regarded from the point of view of thinking, and the attempt is made, in the case of all of these which are recognised as in themselves the content of

belief, to *prove* them on rational grounds. The great theologian Anselm of Canterbury, whom we shall have to consider elsewhere, declares in this sense that, if we are firm in the faith, it is idleness, *negligentiæ mihi esse videtur*, not to know what we believe. In the Protestant Church it has in the same way come about that the rational knowledge of religious truths is cherished and held in honour in combination with theology or along with it. The point of interest was to see how far the natural light of reason, human reason by itself, could progress in the knowledge of the truth, with the important reservation that through religion Man can learn higher truths than reason is in a position to discover of itself.

Here we come upon two distinct spheres, and, to begin with, a peaceful relation between them is justified by means of the distinction that the teachings of positive religion are above but not against reason. This activity of thinking knowledge found itself stimulated and supported from without through the example which lay before its eyes in the pre-Christian, or, speaking generally, non-Christian religions. This showed that the human spirit, even when left to itself, has attained to deep insight into the nature of God, and with all its errors has arrived at great truths, even at fundamental truths, such as the existence of God and the purer idea, free from sensuous ingredients, of that existence, the immortality of the soul, providence, and such like. Thus positive doctrine and the rational knowledge of religious truths have been peacefully pursued alongside of one another. This position of reason in relation to dogma was, however, different from that confidence of reason which was first considered, which dared to approach the highest mysteries of doctrine, such as the Trinity, and the incarnation of Christ; whereas, on the contrary, the point of view referred to after the one just mentioned timidly confined itself to the business of merely venturing through the medium of thought to deal with what the Christian religion possesses in common with heathen and non-Christian religions in general,

and what must therefore remain a part merely of what is abstract in religion. But when once we have become conscious of the difference of these two spheres, we must pronounce the relation of equality in which faith and reason are to be regarded as standing each alongside of the other, to be unintelligible, or else to be a misleading pretence. The tendency of thought to seek unity leads of necessity to the comparison of these spheres first of all, and then when they once pass for different, to the agreement of faith with itself alone, and of thought with itself alone, so that each sphere refuses to recognise the other and rejects it. It is one of the commonest self-deceptions of the Understanding to regard the element of difference, which is found in the one central point of Spirit, as though it must not necessarily advance to opposition and so to contradiction. The point at which the conflict on the part of Spirit begins has been reached as soon as what is concrete in Spirit has, by means of analysis, attained to the consciousness of difference. All that partakes of Spirit is concrete; in this we have before us the Spiritual in its most profound aspect, that of Spirit as the concrete element of faith and thought. The two are not only mixed up in the most manifold way, in immediate passing over from one side to the other, but are so inwardly bound up together that there is no faith which does not contain within itself reflection, argumentation, or, in fact, thought, and, on the other hand, no thinking which does not, even if it be only for the moment, contain faith, — for faith in general is the form of any presupposition, of any assumption, come whence it may, which lies firmly at the foundation — momentary faith. This means that even in free thinking that which now exists as a presupposition, is a comprehended result, thought out either before or after, but in this transformation of the presupposition into a result, again has a side which is a presupposition, an assumption or unconscious immediacy of the activity of the Spirit.

Yet the explanation of the nature of free self-conscious thought we must here leave on one side, and rather remark that for the attainment of this essentially and actually existent union of faith and thought a long time has been necessary — more than fifteen hundred years — and that it has cost the most severe toil to reach the point at which thought has escaped from its absorption in faith, and attained to the abstract consciousness of its freedom, and thereby of its independence and its complete self-sufficiency, in the light of which nothing can have validity for thought which has not come before its judgment-seat, and been then justified as admissible. Thought thus taking its stand upon the extreme point of its freedom — and it is only completely free in this extreme point — and rejecting authority and faith in general, has driven faith in like manner to take its stand in an abstract fashion upon itself, and to attempt entirely to free itself from thought. At all events, it has arrived at the point of declaring itself to be freed from and not to require thought. Wrapped up in unconsciousness of the at all events small amount of thought which must remain to it, it goes on to declare thought to be incapable of reaching truth and destructive of it, so that thought is capable of comprehending one thing only, its incapacity to grasp the truth and see into it, and of proving to itself its own nothingness, with the result that suicide is its highest vocation. So completely has the relation in the view of the time been reversed, that faith has now become exalted as immediate knowledge in opposition to thought, as the only means of attaining to the truth, just as formerly, on the other hand, only that could give peace to Man of which he could become conscious as truth through proof by thought.

This standpoint of opposition cannot better show how important and far-reaching it is than when it is considered in relation to the subject which we have set ourselves to discuss, the knowledge of God. In the working out into opposition of the difference between faith and thought, it is

immediately apparent that they have reached formal extremes in which abstraction is made from all content, so that in the first instance they are no longer opposed as concretely defined religious faith and thought about religious subjects, but abstractly, as faith in general, and as thought in general, or knowledge, in so far as this last does not yield merely forms of thought, but gives us a content in and with its truth. From this point of view the knowledge of God is made dependent on the question as to the nature of knowledge in general, and before we can pass to the investigation of the concrete it seems necessary to ascertain whether the consciousness of what is true can and must be thinking knowledge, or, faith. Our proposed consideration of the knowledge of the existence of God thus changed into this general consideration of knowledge, just as the new philosophical epoch has made it the beginning and foundation of all philosophical speculation that the nature of knowledge itself is to be examined before the actual, i.e., concrete knowledge of an object. We thus incurred the danger — a danger, however, necessary in the interests of thoroughness — of having to trace the subject further back than the time at our disposal for carrying out the aim of these lectures would permit of our doing. If, however, we look more closely at the demand which appears to have met us, it becomes perfectly plain that it is only the subject that has changed with it, not the thing. In both cases, either if we admitted the demand for that inquiry, or stuck directly to our theme, we should have to know, and in that case we should have a subject, too, in the shape of knowledge itself. And as in doing so we should not have emerged from the activity of knowledge, from real knowledge, there is nothing to hinder our leaving the other subject which it is not our aim to consider, alone, and thus stick to our own subject. It will further appear, as we follow out our purpose, that the knowledge of our subject will also in itself justify itself as knowledge. That in true and real knowledge the justification of knowledge will and must lie,

might admittedly be said in advance, for to say so is simply a tautology, just as we may know in advance that the desired way round, the desiring to know knowledge before actual knowledge, is superfluous just because it is inherently absurd. If under the process of knowledge we figure to ourselves an external operation in which it is brought into a merely mechanical relation with an object, that is to say, remains outside it, and is only externally applied to it, knowledge is presented in such a relation as a particular thing for itself, so that it may well be that its forms have nothing in common with the qualities of the object; and thus when it concerns itself with an object, it remains only in its own forms, and does not reach the essential qualities of the object, that is to say, does not become real knowledge of it. In such a relation knowledge is determined as finite, and as of the finite; in its object there remains something essentially inner, whose notion is thus unattainable by and foreign to knowledge, which finds here its limit and its end, and is on that account limited and finite. But to take such a relation as the only one, or as final or absolute, is a purely made-up and unjustifiable assumption of the Understanding. Real knowledge, inasmuch as it does not remain outside the object, but in point of fact occupies itself with it, must be immanent in the object, the proper movement of its nature, only expressed in the form of thought and taken up into consciousness.

We have now provisionally indicated those standpoints of culture which in the case of such material as we have before us ought in the present day to be taken into account. It is pre-eminently, or, properly speaking, only here that it is self-evident that the proposition already laid down, according to which the consideration of knowledge is not different from the consideration of its object, must hold good without limitation. I will therefore at once indicate the general sense in which the proposed theme, the proofs of the existence of God, is taken, and which will be shown to be

the true one. It is that they ought to comprise the elevation of the human spirit to God, and express it for thought, just as the elevation itself is an elevation of thought and into the kingdom of thought.

And to begin with, as regards knowledge, Man is essentially consciousness, and thus what is felt, the content, the determinateness which a feeling or sensation has, is also in consciousness as something presented in the form of an idea. That in virtue of which feeling is religious feeling, is the divine content; it is therefore essentially something of which we have knowledge. But this content is in its essence no sensuous perception or sensuous idea; it does not exist for imagination, but only for thought; God is Spirit, only for Spirit, and only for pure Spirit, that is, for thought. This is the root of such a content, even though imagination and even sense-perception may afterwards accompany it, and this content itself may enter into feeling. It is the elevation of the thinking Spirit to that which is the highest thought, to God, that we thus wish to consider.

This elevation is besides essentially rooted in the nature of our mind. It is necessary to it, and it is this necessity that we have before us in this elevation, and the setting forth of this necessity itself is nothing else than what we call proof. Therefore we have not to prove this elevation from the outside; it proves itself in itself, and this means nothing else than that it is by its very nature necessary. We have only to look to its own process, and we have there, since it is necessary in itself, the necessity, insight into the nature of which has to be vouched for by proof.

SECOND LECTURE

IF THE UNDERTAKING which is commonly called proof of the existence of God has been understood in the form in which it was set forth in the first lecture, the chief objection to it will have been got rid of. For the nature of proof was held to consist in this, that it is only the consciousness of the proper movement of the object in itself. If this thought might be attended with difficulties in its application to other objects, these difficulties would necessarily disappear in the case of the object with which we are concerned, for it is not a passive and external object, but really a subjective movement, the elevation of the Spirit to God, an activity, the following of a certain course, a process, and thus has in it that necessary procedure which constitutes proof, and which has only to be taken up and studied in order that it may be seen to involve proof. But the expression proof carries with it too definitely the idea of a merely subjective line of thought to be followed on our behoof, to allow of the conception of it just stated being considered sufficient in itself apart from any attempt to expressly examine and get rid of this contrasted idea. In this lecture, then, we must first come to an understanding about the nature of proof in general, and with especial definiteness as regards that aspect of it which we here put aside and exclude. It is not our business to assert that there is no proof of the kind indicated, but to assign its limits, and to see that it is not, as is falsely thought, the only form of proof. This is bound up with the contrast drawn between immediate and mediated knowledge, in which in our time the chief interest centres in connection with religious knowledge, and even the religious frame of mind itself, which must accordingly be likewise considered.

The distinction, which has already been touched upon in connection with knowledge, implies that two kinds of proof must be taken into account, of which the one is clearly that which we use simply as an aid to knowledge, as something subjective, whose activity and movement have their place within ourselves, and are not the peculiar movement of the thing considered. That this kind of proof finds a place in the scientific knowledge of finite things and their finite content, becomes apparent when we examine the nature of the procedure more closely. Let us take for this purpose an example from a science in which this method of proof is admittedly applied in its most complete form. If we prove a geometrical proposition every part of the proof must in part carry its justification within itself, so also when we solve an equation in algebra. In part, however, the whole course of procedure is defined and justified through the aim which we have in connection with this, and because that end is attained by such procedure. But we are very well aware that that of which the quantitive value has been developed out of the equation, has not as an actual thing run through these operations in order to reach the quantity which it possesses, and that the magnitude of the geometrical lines, angles, and so on, has not gone through and been brought about by the series of propositions by which we have arrived at it as representing a result. The necessity which we see in such proof corresponds indeed to the individual properties of the object itself, these relations of quantity actually belong to it; but the progress in connecting the one with the other is something which goes on entirely within us; it is a process for realising the aim we have in view, namely, to see into the meaning of the thing, not a course in which the object arrives at its inherent relations and their connection. It does not thus create itself, and is not created, as we create it and its relations in the process of attaining insight into it.

Besides proof proper, of which the essential characteristic — for this is all that is necessary for the purpose of our investigation — has been brought out, we find further, that in the region of finite knowledge the term proof is also applied to what, when more closely examined, is only the indicating of something, the pointing out of an idea, a proposition, a law, and so on in experience. Historical proof we do not require from the point of view from which we here consider knowledge, to elaborate in detail; it depends for its material on experience, or rather perception. Looked at in one light, it makes no difference that it has reference to foreign perceptions and their evidences; argumentation, that is to say, the exercise of understanding proper regarding the objective connection of circumstances and actions, makes these data into presuppositions and fundamental assumptions, just as its criticism of evidences has done in drawing its conclusions. But in so far as argument and criticism constitute the other essential side of historical proof, such proof treats its data as being the ideas of other people; the subjective element directly enters into the material, and the reasoning about and combination of that material is likewise subjective activity; so that the course and activity of knowledge has quite different ingredients from the course followed by the circumstances themselves. As regards the pointing things out in everyday experience, this is certainly concerned, in the first instance, with individual perceptions, observations, and so on, that is to say, with the kind of material which is only pointed out, but its interest is by so doing to prove further that there are in Nature and in Spirit such species and kinds, such laws, forces, faculties, and activities as are mentioned in the sciences. We pass by the metaphysical or common psychological reflections about that subjective element of sense, external and internal, which accompanies perception. But the material, however, in so far as it enters into the sciences, is not so left to itself as it is in the senses and in perception. On the contrary, the content of the sciences — the species,

kinds, laws, forces, and so on — is built up out of that material, which is, perhaps, already called by the name of phenomena, by putting together through analysis what is common, the leaving aside of what is not essential, the retention of what is called essential, without any certain test having been applied to distinguish between what is to be regarded as non-essential and what as essential. It is admitted that what is perceived does not itself make these abstractions, does not compare its individuals (or individual positions, circumstances, and so on), or put what is common in them together; that therefore a great part of the activity of knowledge is a subjective affair, just as in the content which has been obtained a part of its definitions, as being logical forms, are the product of this subjective activity. The expression "predicate," or mark (Merkmal), if people will still use this stupid expression, directly indicates a subjective purpose of isolating properties for our use in marking distinctions, while others, which likewise exist in the object, are put aside. This expression is to be called stupid, because the definitions of species and kinds directly pass for something essential and objective, and not as existing merely for us who mark distinctions. We may certainly also express ourselves by saying that the species leaves aside, in one kind, properties which it places in another, or that energy in one form of its manifestation leaves aside circumstances which are present in another, that these circumstances are thus shown by it to be unessential, and it of itself gives up the form of its manifestation, and withdraws itself into inactivity or self-containedness; that thus, for example, the law of the motion of the heavenly bodies penetrates to every single place and every moment in which the heavenly body occupies that place, and just by this continual abstraction shows itself to be a law. If we thus look on abstraction as objective activity, which it so far is, it is yet very different from subjective activity and its products. The former leaves the heavenly body to fall back again after abstraction from this particular place and this particular

moment into the particular changing place and moment of time, just as the species may appear in the kind in other contingent or unessential forms and in the external particularity of individuals. On the other hand, subjective abstraction raises the law like the species into its universality as such, and makes it exist and preserves it in this form, in the mind.

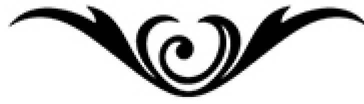
In these forms of the knowledge which progresses from mere indication to proof, from immediate objectivity to special products, the necessity may be felt of considering explicitly the method, the nature, and fashion of the subjective activity, in order to test its claims and procedure; for this method has its own characteristics and kind of progress which are quite different from the characteristics and process of the object in itself. And without entering more particularly into the nature of this method of knowledge, it becomes immediately apparent, from a single characteristic which we observe in it, that inasmuch as it is represented as being concerned with the object in accordance with subjective forms, it is only capable of apprehending relations of the object. It is therefore idle to start the question whether these relations are objective and real or only subjective and ideal, not to mention the fact that such expressions as subjectivity and objectivity, reality and ideality, are simply vague abstractions. The content, be it objective or merely subjective, real or ideal, remains always the same, an aggregate of relations, not something that is in-and-for-itself, the notion of the thing, or the infinite, with which knowledge must have to do. If that content of knowledge is taken by perverted sense as containing relations only, and these are understood to be phenomena or relations to a faculty of subjective knowledge, it must, so far as results are concerned, always be recognised as representing the great intellectual advance which modern philosophy has achieved, that the mode of thinking, proving, and knowing the infinite, which has been described, is proved incapable of reaching what is eternal and divine.

What has been brought out in the preceding exposition regarding knowledge in general, and especially what relates to thinking knowledge (which is what alone concerns us), and to proof, the principal moment in that knowledge, we have looked at from the point of view from which it is seen to be a movement of the activity of thought which is outside the object and different from the development of the object itself. This definition may in part be taken to be sufficient for our purpose, but partly, too, it is to be taken as what is essential in opposition to the one-sidedness which lies in the reflections about the subjectivity of knowledge.

In the opposition of the process of knowledge to the object to be known lies the finiteness of knowledge. But this opposition is not on that account to be regarded as itself infinite and absolute, and its products are not to be taken to be appearances only because of the mere abstraction of subjectivity; but in so far as they themselves are determined by that opposition, the content as such is affected by the externality referred to. This point of view has an effect upon the nature of the content, and yields a definite insight into it; while, on the contrary, the other way of looking at the question gives us nothing but the abstract category of the subjective, which is, moreover, taken to be absolute. What we thus get as the result of the way in which we look at the proof, for the otherwise quite general quality of the content, is, speaking generally, just this, that the content, inasmuch as it bears an external relation to knowledge, is itself determined as something external, or, to put it more definitely, consists of abstractions from finite properties. Mathematical content as such is essentially magnitude. Geometrical figures pertain to space, and have thus in themselves externality as their principle, since they are distinguished from real objects, and represent only the one-sided spatiality of these objects, as distinguished from their concrete filling up, through which they first became real. So number has the unit for its principle, and is the putting

together of a multiplicity of units which are independent, and is thus a completely external combination. The knowledge which we have here before us can only attain its greatest perfection in this field, because that field contains only simple and definite qualities, and the dependence of these upon each other, the insight into the nature of which is proof, is thus stable, and ensures for proof the logical progress of necessity. This kind of knowledge is capable of exhausting the nature of its objects. The logical nature of the process of proof is not, however, confined to mathematical content, but enters into all departments of natural and spiritual material; but we may sum up what is logical in knowledge in connection with proof by saying that it depends on the rules of inference; the proofs of the existence of God are therefore essentially inferences. The express investigation of these forms belongs, however, partly to logic, and for the rest the nature of the fundamental defect must be ascertained in the course of the examination of these proofs which is about to be taken in hand. For the present it is enough to remark further, in connection with what has been said, that the rules of inference have a kind of foundation which is of the nature of mathematical calculation. The connection of propositions which are requisite to constitute a syllogistic conclusion depends on the relations of the sphere which each of them occupies as regards the other, and which is quite properly regarded as greater or smaller. The definite extent of such a sphere is what determines the correctness of the subsumption. The older logicians, such as Lambert and Ploucquet, have been at the pains of inventing a notation by means of which the relation in inference may be reduced to that of identity, that is, to the abstract mathematical relation of equality, so that inference is shown to be the mechanism of a kind of calculation. As regards, however, the further nature of knowledge in such an external connection of objects, which in their very nature are external in themselves, we shall have to speak of it presently under the name of

mediate knowledge, and to consider the opposition in its more definite form.



As regards these forms which are called species, laws, forces, and so on, knowledge does not stand to them in an external relation; they are rather its products. But the knowledge which produces them, as has been shown, produces them only by abstraction from what is objective; they have their root in this, but are essentially separated from what is actual; they are more concrete than mathematical figures, but their content differs essentially from that from which the start was made, and which must constitute their only foundation of proof.

The defective element in this mode of knowledge has thus attention drawn to it in a different form from that shown in the way of looking at it, which declares the products of knowledge to be mere phenomena, because knowledge itself is only a subjective activity. But the general result, however, is the same, and we have now to see what has been set over against this result. What is determined as insufficient for the aim of the Spirit, which is the absorption into its very nature of what is infinite, eternal, divine, is the activity of the Spirit which in thinking proceeds by means of abstraction, inference, and proof. This view, itself the product of the mode of thought characteristic of the period, has jumped straight over to the other extreme in giving out a proofless, immediate knowledge, an unreasoning faith, a feeling devoid of thought, as the only way of grasping and having within oneself divine truth. It is asserted that that kind of knowledge which is insufficient for the higher kind of truth is the exclusive and sole kind of knowledge. The two assumptions are most closely connected. On the one side, we have, in the investigation of what we have undertaken to consider, to free that knowledge from its one-sidedness, and in doing so at the same time to show by facts that there exists another kind of knowledge than that which is given out as the only kind. On the other

side, the pretension which faith as such sets up against knowledge is a prejudice which occupies too firm and sure a position not to make a stricter investigation necessary. In view of this pretension it must be borne in mind that the true, unsophisticated faith, the more it in case of dire necessity might reasonably make pretensions, the less it does make them, and that the case of necessity exists only for the merely rationalising, dry, and polemical assertion of faith.

But I have elsewhere already explained how the matter stands as regards that faith or immediate knowledge. It is not possible that in the forefront of any attempt to deal at the present time with the proofs of the existence of God, the position taken up by faith can be set aside as done with; the chief points from which it is to be criticised, and the place to be assigned to it, must at least be called to mind.

THIRD LECTURE

IT HAS ALREADY been remarked that the assertion of faith, of which we have to speak, is found outside of genuine simple faith. This latter, in so far as it has advanced to conscious knowledge, and has consequently acquired a consciousness of knowledge, accedes to knowledge with full confidence in it, because it is pre-eminently full of confidence in itself, is sure of itself, and firmly established in itself. We are rather concerned with faith in so far as it takes up a polemical attitude towards rational knowledge, and expresses itself in a polemical fashion even against knowledge in general. It is thus not a faith which opposes itself to another kind of faith. Faith (or belief) is what is common to both; it is therefore the content which fights against the content. But this fact of having to do with content at once brings knowledge with it. If it were otherwise, the overthrow and defence of the truth of religion would not be carried out with external weapons, which are just as foreign to faith and religion as to knowledge. The faith which rejects knowledge as such, is just because of this devoid of content, and is, to begin with, to be taken abstractly as faith in general, as it opposes itself to concrete knowledge, to rational knowledge, without reference to content. As thus abstract, it is removed back into the simplicity of self-consciousness. This is in its simplicity, in so far as it has any fulness at all, feeling, and what is content in knowledge is definiteness of feeling. The assertion of abstract faith thus leads immediately to the form of feeling, in which the subjectivity of knowledge intrenches itself as in an inaccessible place. The standpoints of both must therefore be briefly indicated, from which their one-sidedness, and consequently the untruth of the fashion in which they are asserted to be ultimate and fundamental determinations,

becomes apparent. Faith, to begin with it, starts from this, that the nullity of knowledge, so far as absolute truth is concerned, has been demonstrated. We wish so to proceed as to leave faith in possession of this assumption, and to see accordingly what it is in itself.

To begin with, if the opposition is conceived of as being of such an absolutely general kind as that between faith and knowledge, as we often hear it put, this abstraction must be directly found fault with. For faith belongs to consciousness; we know about what we believe; nay, we know about it with certainty. It is thus at once apparent that it is absurd to wish to separate faith and knowledge in such a general fashion.

But faith is now called immediate knowledge, and is accordingly to be distinguished radically from mediate and mediating knowledge. Since at this stage we leave on one side the speculative examination of these conceptions, in order to keep within the proper sphere of this kind of assertion, we will oppose to this separation, which is asserted to be absolute, the fact that there is no act of knowledge, any more than there is any act of sensation, conception, or volition, no activity, property, or condition pertaining to Spirit, which is not mediated and mediating; just as there is no other object in Nature or Spirit, be it what it may, in heaven or the earth, or under the earth, which does not include within itself the quality of mediation as well as that of immediacy. It is thus as a universal fact that logical philosophy presents it — we might add, along with the exhibition of its necessity, to which we need not here appeal — in the completed circle of the forms of thought. As regards the matter of sense, whether it belongs to outer or inner perception, it is admitted that it is finite, that is, that it exists only as mediated through what is other than sense. But of this matter itself, and still more of the higher content of Spirit, it will be admitted that it derives its essential character from categories, and that the nature of this character is shown in logic to be the possession of the moment of mediation

above indicated inseparably in itself. But we pause here to call attention to the absolutely universal fact, in whatever sense and with whatever meaning the facts may be understood. Without digressing into examples, we abide by the one object which here lies nearest to us.

God is activity, free activity relating itself to itself, and remaining with itself. The essential element in the notion or conception of God, or, for that matter, in every idea of God, is that He is Himself, the mediation of Himself with Himself. If God is defined merely as the Creator, His activity is taken only as going out of itself, as expanding itself out of itself, as sensible or material producing, without any return into itself. The product is something different from Him, it is the world; the introduction of the category of mediation would at once bring with it the idea that God must be through the medium of the world; one might, at all events, say with truth that He is Creator only by means of the world, or what He creates. Only this would be mere empty tautology; for the category, "that which is created," is itself directly involved in the first category, that of the Creator. On the other hand, what is created remains, so far as the ordinary idea of it is concerned, as a world outside God, as an Other over against Him, so that He exists away beyond that world, apart from it, in-and-for-Himself. But in Christianity least of all is it true that we have to know God only as creation, activity, not as Spirit. The fact rather is that to this religion, the explicit consciousness that God is Spirit is peculiar, the consciousness that He, even as He is in-and-for-Himself, relates Himself, as it were, to the Other of Himself (called the Son), to Himself, that He is related to Himself in Himself as love, essentially as this love is mediation with itself. God is indeed the Creator of the world, and is so sufficiently defined. But God is more than this; He is the true God in that He is the mediation of Himself with Himself, and is this love.

Faith, then, inasmuch as it has God as the object of its consciousness, has this mediation for its object; just as faith, as existing in the individual, only exists through teaching and training, the teaching and training of men, but still more through the teaching and training of the Spirit of God, and exists only through this process of mediation. But faith, like consciousness in general, this relation of the subject to an object, is quite abstract, whether God is its object, or whatever thing or content may be the object, and so faith or knowledge only exists through the medium of an object. Otherwise we have empty identity, a faith in or knowledge of nothing.

But conversely there is to be found here the other fact that, in like manner, there can be nothing which is only and exclusively the product of mediation. If we examine into what we understand by immediacy, it will be seen that it must exist in itself without any difference, such as that through which mediation is at once posited. It is simple reference to self, and is thus in its immediate form merely Being. Now all knowledge, mediate and immediate, and indeed everything else, at all events is; and that it is, is itself the least and most abstract thing that one can say of anything. If it is even only subjective, as faith or knowledge is, at all events it is, the predicate of Being belongs to it, just as such Being appertains to the object which exists only in faith or knowledge. The insight involved in this view is of a very simple kind. Yet we may be impatient with philosophy just because of this simplicity, in so far as we pass from the fulness and warmth which belong to faith, over to such abstractions as Being and immediacy. But, in point of fact, this is not the fault of philosophy; on the contrary, it is that assertion of faith and immediate knowledge which takes its stand on these abstractions. In this fact, that faith is not mediate knowledge, there lies the entire value of the matter, and the verdict passed upon it. But we come also to the content, or rather, we may likewise come only to the relation of a content, to knowledge.

It is further to be remarked that immediacy in knowledge, which is faith, has this further quality, that faith knows that in which it believes, not merely generally, not merely in the sense of having an idea or knowledge from without of it, but knows it with certainty. It is in certainty that the nerve of faith lies. And here we encounter a further distinction, we further distinguish truth from certainty. We know very well that much has been known, and is known for certain, which is nevertheless not true. Men have long enough known it to be certain, and millions still know it to be certain, to take a trivial example, that the sun goes round the earth. And what is more, the Egyptians believed, and knew it for certain, that Apis was a great or the greatest god; while the Greeks thought the same regarding Jupiter; just as the Hindus still know for certain that the cow, and other inhabitants of India, the Mongols and many races, that a man, the Dalai-Lama, is God. That this certainty is expressed and asserted is admitted. A man may quite well say, I know something for certain, I believe it, it is true. But, at the same time, every one else must be allowed the right to say the same thing, for every one is "I," every one knows, every one knows for certain. But this unavoidable admission expresses the truth that this knowledge, knowledge for certain, this abstraction, may have a content of the most diverse and opposite kind, and the proof of the content must lie just in this assurance of being certain, of faith. But what man will come forward and say, Only that which I know and know as certain is true; what I know as certain is true just because I know it as certain. Truth stands eternally over against mere certainty, and neither certainty, nor immediate knowledge, nor faith decides what is truth. Christ directed the minds of the Apostles and His friends away from the genuinely immediate visible certainty which they derived from His immediate presence, from His own sayings and spoken words heard with their ears and apprehended through their senses and feelings, away from such a faith and such a source of faith to the truth, into which

they were to be led only in the further future and through the Spirit. For the attainment of anything more in addition to this highest certainty, derived from the source above indicated, there exists nothing except just what is in the content itself.

Faith, in so far as it is defined to be immediate knowledge, as distinguished from what is mediate, reduces itself to the abstract formalism above mentioned. This abstraction makes it possible not only to rank as faith the sensuous certainty which I have that I possess a body, and that there are things outside me, but to deduce or prove from it what the nature of faith is. But we should do gross injustice to what in the sphere of religion is termed faith if we were to see in it only this abstraction. Faith must rather be full of substance; it must be a content, and this is to be a true content; it must be far removed from such a content as the sensuous certainty that I have a body, that things perceived by the senses surround me. It must contain the truth, and quite a different truth from that last mentioned, the truth of finite things of sense, and derived from quite a different source. The tendency above indicated to formal subjectivity must find faith as such even too objective, for this latter has always to do with ideas of things, with a knowledge of them, with a state of conviction regarding some content. This extreme form of the subjective, in which the definite form of the content and the conception and knowledge of it have vanished, is that of feeling. We cannot, therefore, avoid speaking of it too; it is this form, moreover, which is asked for in our times, not feeling of the simple or naive kind, but as a result of culture, derived from grounds or reasons which are the same as those already referred to.

FOURTH LECTURE

As has been shown in the preceding lecture, the form of feeling is closely related to mere faith as such. It is the yet more intensive forcing back of self-consciousness into itself, the development of the content to mere definiteness of feeling.

Religion must be felt, must exist in feeling, otherwise it is not religion; faith cannot exist without feeling, otherwise it is not religion. This must be admitted to be true, for feeling is nothing but my subjectivity in its simplicity and immediacy — myself as this particular existent personality. If I have religion only as idea, faith takes the form of certainty about these ideas; its content is before me, it is still an object over against me; it is not yet identical with me as simple self; I am not so penetrated through and through with it that it constitutes my qualitative, determinate character. The very inmost unity of the content of faith with me is requisite in order that I may have quality or substance, its substance. It thus becomes my feeling. As against religion Man must hold nothing in reserve for himself, for it is the innermost region of truth. Religion must therefore possess not only this as yet abstract "I," which even as faith is yet knowledge, but the concrete "I" in its simple personality, comprehending the whole of it in itself. Feeling is this inwardness which is not separated in itself.

Feeling is, however, understood to have the property of being something purely individual, lasting for a single moment, just as one individual thing in the process of alternation with another exists either after that other or alongside of it. But the heart signifies the all-embracing unity of the feelings, both in their quantity and also as regards their duration in time. The heart is the ground or basis which contains in itself and preserves the

essential nature of feelings, independent of the fleeting nature of their succession in consciousness. In this their unbroken unity — for the heart expresses the simple pulse of the living spirit — religion is able to penetrate the different kinds of feeling, and to become for them the substance which holds, masters, and rules them.

But this brings us at once to the reflection that feeling and heart as such are only the one side, definite forms of feeling and heart being the other. And, accordingly, we must at once go further and say, that just as little is religion true, because it exists in our feelings or hearts, as because it is believed and known immediately and for certain. All religions, even the most false and unworthy, exist in our feelings and hearts just as much as those that are true. There are feelings which are immoral, unjust, and godless, just as much as there are feelings which are moral, just, and pious. Out of the heart proceed evil thoughts, murder, adultery, backbiting, and so forth; that is to say, the fact that thoughts are not bad, but good, does not depend on their being in the heart and proceeding out of it. We have to do with the definite form which is assumed by the feeling which is in the heart. This is a truism so trivial that one hesitates to give it expression, but it is part of philosophical culture to carry the analysis of ideas even to the length of questioning and denying what is most simple and most commonly received. To that shallow type of thought or Enlightenment which is vain of its boldness, it appears unmeaning and unseemly to recall trivial truths, such, for instance, as that which may be here once more brought to mind, the truth that Man is distinguished from the brute by the faculty of thought, but shares that of feeling with it. If feeling is religious feeling, religion is its definite quality. If it is wicked, bad feeling, what is bad and wicked is its definite quality. It is this determinate quality which forms the content for consciousness, what in the words already used is called thought. Feeling is bad on account of its bad content; the heart, because of its sinful thoughts.

Feeling is the common form for the most different kinds of content. It can on that account just as little serve as a justification for any of its determinate qualities, for its content, as can immediate certainty.

Feeling makes itself known as a subjective form, as being something in me, while I am the subject of something. This form is that which is simple, which remains equal to itself, and therefore potentially indeterminate in every difference of content — the abstraction of my existence as a single individual. The determinateness or special character of the feeling is, on the contrary, to begin with, difference in general, the being unlike some other, being manifold. It must therefore be explicitly distinguished from the general form whose particular and definite quality it is, and be regarded on its own account. It has the form of the content which must be regarded "on its own merits," and judged on its own account; on this value depends the value of the feeling. This content must be true, to begin with, and independently of the feeling, just as religion is true on its own account — it is what is in itself necessary and universal — the Thing or true fact which develops itself to a kingdom of truths and of laws, as well as to a kingdom of their knowledge and their final ground, God.

I shall indicate only in outline the consequences which ensue if immediate knowledge and feeling as such are elevated into a principle. It is their very concentration which carries with it for the content, simplification, abstraction, and indefiniteness. Thus they both reduce the divine content, be it religious as such, or legal and moral, to a minimum, to what is most abstract. With this the determination of the content becomes arbitrary, for in that minimum there exists nothing determinate. This is a weighty consequence, from a theoretical as well as a practical point of view. Chiefly from a practical, for since, for the justification of disposition and action, reasons are necessary, the faculty of argument must still be very untrained,

and very little skilled in its work, if it does not know how to assign good reasons for what is arbitrary.

Another feature in the situation, which the withdrawal into immediate knowledge and into feeling brings into view, concerns the relation of men to other men, and their spiritual fellowship. The objective, the true fact or Thing, is what is in-and-for-itself universal, and is so, therefore, for all. As what is most universal, it is implicitly thought in general; and thought is the common basis. The man who betakes himself to feeling, to immediate knowledge, to his own ideas or his own thoughts, shuts himself up, as I have already said, in his own particularity, and breaks off any fellowship or community with others — the only way is to leave him alone. But this kind of feeling and heart lets us see more closely into the nature of feeling and heart. Restricting itself in accordance with its first principle to its own feeling, the consciousness of a content degrades it to the determinate form belonging to itself; it maintains itself rigidly as self-consciousness, in which this determinateness inheres; the self is for consciousness the object which it sets before itself, the substance which has the content only as an attribute, as a predicate in it, so that it is not the independent element in which the subject is sublated, or loses itself. The subject is itself in this way a fixed condition, which has been called the life of feeling. In the so-called Irony, which is connected with it, the "myself "is abstract only in relation to itself; in the distinction of itself from its content it stands as pure consciousness of itself, and as separated from it. In the life of feeling this subject exists rather in the above-mentioned identity with the content, it is definite consciousness in it, and remains as this individual "I," object and end to itself. As the religious individual "I," it is end to itself; this individual "I" is object and end in general; in the expression, for instance, that I am blessed, and in so far as this blessedness is brought about through belief in the truth, the "I" is filled with truth and penetrated by it. Filled in this way with

yearning, it is unsatisfied in itself; but this yearning is the yearning of religion; it is, accordingly, satisfied in having this yearning in itself; in it it has the subjective consciousness of itself, and of itself as the religious self. Carried beyond itself only in this yearning, it is just in it that it preserves itself and the consciousness of being satisfied, and in close connection with this the consciousness of its contentment with itself. But this inwardness involves at the same time the opposite condition which consists in that most unhappy sense of division experienced by the pure hearted. While I regard myself strictly as this particular and abstract "I," and compare my particular impulses, inclinations, and thoughts, with what ought to fill my nature, I am able to feel that this contrast is a painful contradiction within myself, which becomes permanent, owing to the fact that "I," as this particular subjective "me," have it as my aim and object to concern myself about myself as my individual self. It is just this fixed reflection which prevents me from being filled by the substantial content, by the Thing or true fact, for in the true fact I forget myself; in the very act of becoming absorbed in it that reflection upon myself disappears of itself. I am characterised as subjective only in that opposition to the Thing which remains with me through reflection on myself. In thus keeping myself outside of the Thing or true fact, and since this Thing constitutes my end, the real interest is transferred from the attentive observation of the Thing back to myself. I thus go on unceasingly emptying myself, and continue in this condition of emptiness. The hollowness which thus attaches to the highest end pursued by the individual, namely, pious effort and anxiety about the welfare of his own soul, has led to the most inhuman manifestations of a feeble and spiritless reality, ranging from the quiet anxiety of a loving disposition to the suffering caused to the soul by despair and madness. This was still more the case in former times than in these later days when the sense of satisfaction in the yearning has gained the upper hand of the sense of division, and has

produced in the soul a feeling of contentment and even a sense of irony itself. Unreality in the heart, such as that referred to, is not only emptiness, but is also narrow-heartedness. It is its own formal, subjective life with which it is filled; it always has this particular "I" as its object and end. It is only the truly Universal, the Universal in-and-for-itself, which is broad, and the heart inwardly extends only by entering into this, and expanding within this substantial element, which is at once the religious, the moral, and the legal element. Speaking generally, love is the abandonment on the part of the heart of limitation to a particular point of its own, and its reception of the love of God is the reception of that development or unfolding of His Spirit which comprehends in itself all true content, and swallows up in this objectivity whatever is merely peculiar to the heart. In this substantial element the subjectivity, which is for the heart itself a one-sided form, is given up, and this at the same time supplies the impulse to throw off the subjectivity. This is the impulse to action in general, or, more strictly speaking, it is the impulse to take part in the action of the content which is divine in-and-for-itself, and is therefore the content which has absolute power and authority. It is this, accordingly, which constitutes the reality or real existence of the heart, and it is indivisibly both that inner reality and also outer reality.

When we have thus distinguished between what, because it is buried in and absorbed into the Thing or true object, is the unsophisticated heart, and the heart which in reflection is consciously occupied with itself, we find that the distinction constitutes the relation in which the heart stands to the substantial element. So long as the heart remains within itself, and consequently remains outside of this element, it is by its own act in an external and contingent relation to this element. This connection, which leads the heart to declare what is just, and to lay down the law in accordance with its own feeling, has been already mentioned. To the

objectivity of action, that is, to action which originates in the truly substantial element, subjectivity opposes feeling, and to this substantial element and to the thinking knowledge of it it opposes immediate knowledge. Here, however, we do not stay to consider the nature of action, but simply remark that it is just this substantial element, represented by the laws of justice and morality and the commandments of God, which is by its very nature the true Universal, and has consequently its root and basis in the region of thought. If sometimes the laws of justice and morality are regarded merely as arbitrary commands of God — which would mean, in fact, that they were irrational — still it would take us too far to make that our starting-point. But the putting on a permanent basis and the investigation of the conviction, on the part of the conscious subject, of the truth of the principles which ought to constitute for him the basis of his action, is thinking knowledge. While the unsophisticated heart yields itself up to these principles, its insight is as yet so undeveloped, and any pretension on its part to independence is so foreign to it, that it reaches them rather by the road of authority, and thus this part of the heart in which they are implanted is alone the place of conscious thought, for they are themselves the thoughts of action, and are inherently universal principles. This heart cannot, therefore, offer any opposition to the development of what is its own objective basis, any more than it can to that of those truths which belong to it, and which at first appear in themselves rather as theoretical truths pertaining to its religious faith. As, however, this possession, and the intensity which characterises it, are already in the heart only through the mediation of education, which has asserted its influence upon its thought and knowledge just as it has upon its volition, so, in a still greater degree, the further developed content, and the alteration in the circle of its ideas which are implicitly native to the place where they are found,

also represent mediating knowledge mediated into the conscious form of thought.

FIFTH LECTURE

WE MAY SUM up what has gone before as follows. The heart ought not to have any dread of knowledge; the determinateness of feeling, the content of the heart, ought to have a substantial form. Feeling or the heart must be filled by the Thing or true object by what actually exists, and consequently be broad and true in character. But this Thing, this substantial element, is simply the truth of the Divine Spirit, the Universal in-and-for-itself, though just because of this it is not the abstract Universal, but the Universal in the development which belongs essentially to itself. The substantial element is thus essentially implicit thought, and exists in thought. But thought, what constitutes the really inner nature of faith itself, if it is to be known as essential and true — in so far as faith is no longer something implicit and merely natural, but is regarded as having entered into the sphere of knowledge with all its requirements and claims — must at the same time be known as something necessary, and must have gained a consciousness of itself and of the connected nature of its development. It thus extends and proves itself at the same time; for, speaking generally, to prove simply means to become conscious of the connection, and consequently of the necessity of things, and in relation to our present design it means the recognition of the particular content in the Universal in-and-for-itself, and of how this absolute truth itself is the result, and is consequently the final truth of all particular content. This connection, which is thus present to consciousness, must not be a subjective movement of thought outside of reality, but must follow this latter, and must simply unfold its meaning and necessity. Knowledge is just this unfolding of the objective movement of the content, of the inner necessity which essentially belongs to it, and it is

true knowledge since it is in unity with the object. For us this object must be the elevation of our spirit to God, and is thus what we have referred to as the necessity of absolute truth in the form of that final result into which everything returns in the Spirit.

But because it contains the name of God, the mention of this end may easily have the effect of rendering worthless all that was urged against the false ideas of knowledge, cognition, and feeling, and all that was gained in the way of a conception of true knowledge.

It has already been remarked that the question as to whether our reason can know God, was made a formal one; that is to say, it was referred to the criticism of knowledge, of rational knowledge in general, and connected with the nature of faith and feeling in such a way that what is included under these special heads is to be understood apart altogether from any content. This is the position taken up by immediate knowledge, which itself speaks with the fruit of the tree of knowledge in its mouth, and transfers the problem to the formal sphere since it bases the justification of such knowledge, and of this exclusively, on the reflections which it makes regarding proof and philosophical knowledge, and as a consequence it has to put the true and infinite content outside of the range of its reflections, because it does not get beyond the idea of finite knowledge and cognition. With this presupposition of a knowledge and cognition which are merely finite, we contrasted the knowledge which does not remain outside of the Thing or true reality, but which, without introducing any of its own qualities, simply follows the course of true reality, and we have directed attention to the substantial element in feeling and the heart, and have shown that, speaking generally, it exists essentially for consciousness and for conscious thought, in so far as its truth has to be worked out in what constitutes its most inner nature. But owing to the mention of the name of God, this object defined as knowledge in general, as well as the study of it,

have been forced into an inferior position, and connected with that subjective way of looking at things for which God is something above. Since, in what has gone before, this aspect of the matter has received sufficient elucidation, and can be here indicated merely, rather than examined in detail, the only other thing to do would be to explain the relation of God in and to knowledge as deduced from the nature of God. In connection with this it may be remarked, first of all, that our subject, namely, the elevation of the subjective spirit to God, directly implies that in this very act of elevation the one-sidedness of knowledge, that is, its subjectivity, is abolished, and that it is itself essentially this process of abolition and absorption. Consequently, the knowledge of the other side of the subject, namely, the nature of God, and, together with this, His relation in and to knowledge, comes in here of itself. But there is one drawback connected with what is of an introductory and incidental character, and is yet necessary here, and it is this, that any thorough treatment of the subject renders it superfluous. Still we may so far anticipate as to say that there can be no thought here of carrying our treatment of the subject to the point reached by the explanation so intimately connected with it, of the self-consciousness of God, and of the relation of His knowledge of Himself to the knowledge of Himself in and through the human spirit. Without referring you here to the more abstract and systematic discussions on this subject to be found in my other works, I may call attention to a very remarkable book which has recently appeared, entitled, “Aphorisms on Agnosticism and Absolute Knowledge in Relation to the Science of Christian Faith,” by C. Fr. G l (Berlin: C. Franklin). It makes reference to my statement of philosophical principles, and contains quite as much thoroughly grounded Christian belief as it does speculative and philosophical depth. It throws light on all the points of view from which the Understanding directs its attack on the Christianity of knowledge, and

answers the objections and counter-arguments which the theory of agnosticism (Nichtwissen) has brought against philosophy. It shows in particular the misunderstanding and the want of understanding of which the pious consciousness is guilty when it ranges itself on the side of the explaining Understanding in connection with the principle of agnosticism, and thus makes common cause with it in its opposition to speculative philosophy. What is there advanced regarding the self-consciousness of God, His knowledge of Himself in men, and Man's knowledge of himself in God, has direct reference to the point of view just indicated, and it is marked by speculative thoroughness while casting light on the false opinions which have been attributed alike to philosophy and to Christianity in connection with these subjects.

But even in connection with the purely general ideas to which we here confine ourselves, in order that, taking God as the starting-point, we may discuss the relation in which He stands to the human spirit, we are met more than anywhere else by an assumption which is in contradiction with any such design — namely, that we do not know God; that even in the act of believing in Him we do not know what He is, and therefore cannot start from Him. To take God as the starting-point would be to presuppose that we were able to state, and had stated, what God is in Himself as being the primary object. That assumption, however, permits us to speak merely of our relation to Him, to speak of religion and not of God Himself. It does not permit of the establishment of a theology, of a doctrine of God, though it certainly does allow of a doctrine of religion.

If there is not exactly any such doctrine, we at least hear much talk — an infinite amount of it, or rather, little talk with infinite repetitions — about religion, and therefore all the less about God Himself. This everlasting explanation of religion, of its necessity, its usefulness, and so on, together with the insignificant attempts to explain God, or the prohibition even of

any attempt at explaining His nature, is a peculiar phenomenon of the culture of our time. We get off most easily when we rest contented with this standpoint, so that we have nothing before us but the barren characterisation of a relation in which our consciousness stands to God. As thus understood, religion means at least that our spirit comes into contact with this content, and our consciousness with this object, and is not merely, so to speak, a drawing out of the lines of longing into empty space, an act of perception which perceives nothing and finds nothing actually confronting it. Such a relation implies, at all events, this much, that we not only stand in a certain connection with God, but that God stands also in a certain connection with us. This zeal for religion expresses, hypothetically at least, something regarding our relation to God, if it does not express exclusively what would be the really logical outcome of the principle of the impossibility of knowing God. A one-sided relation, however, is not a relation at all. If, in fact, we are to understand by religion nothing more than a relation between ourselves and God, then God is left without any independent existence. God would, on this theory, exist in religion only, He would be something posited, something produced by us. The expression that God exists in religion only, an expression which is both frequently employed and found fault with, has, however, the true and important meaning that it belongs to the nature of God in His condition of complete and perfect independence that He should exist for the spirit of Man, and should communicate Himself to Man. The meaning here expressed is totally different from that previously referred to, according to which God is merely a postulate, a belief. God is, and gives Himself to men by coming into a relation with them. If this word is is limited to the expression of the truth that we do indeed know or recognise the fact that God is, but do not know what He is, and is thus used with a constantly recurring reflection on knowledge, then this would imply that no substantial qualities can be attributed to Him. Thus

we should not have to say we know that God is, but could merely speak of is; for the word God introduces an idea, and consequently a substantial element, a content with definite characteristics, and apart from these God is an empty word. If in the language of this agnosticism (Nichtwissen) those characteristics to which we must still find it possible to refer are limited to express something negative — and for this the expression the Infinite is peculiarly appropriate, whether by it is meant the Infinite in general or those so-called attributes extended into infinity — then all that this gives us is merely indeterminate Being, abstraction, a kind of supreme or infinite Essence which is expressly our product, the product of abstraction, of thought, and does not get beyond being mere Understanding.

If, however, God is not thought of as existing in subjective knowledge merely, or in faith, but if it is seriously meant that He exists, that He exists for us, and has on His part a relation to us, and if we do not get beyond this merely formal characteristic, it is all the same implied that He communicates Himself to men, and this is to admit that God is not jealous. The Greeks of purely ancient times attributed jealousy to God when they represented Him as putting down all that was generally regarded as great and lofty, and as wishing to have and actually placing everything on a level. Plato and Aristotle were opposed to the idea of divine jealousy, and the Christian religion is still more opposed to it since it teaches that God humbled Himself even to taking on the form of a servant amongst men, that He revealed Himself to them; that, consequently, far from grudging men what is high, nay even what is highest, He, on the contrary, along with that very revelation, laid on them the command that they should know God, and at the same time indicated that this was Man's highest duty. Without appealing to this part of the teaching of Christianity, we may take our stand on the fact that God is not jealous, and ask, Why should He not communicate Himself to Man? It is recorded that in Athens there was a law

according to which any man who had a lighted candle and refused to allow another to light his at it, was to be punished with death. This kind of communication is illustrated even in connection with physical light, since it spreads and imparts itself to some other thing without itself diminishing or losing anything; and still more is it the nature of Spirit itself to remain in entire possession of what belongs to it, while giving another a share in what it possesses. We believe in God's infinite goodness in Nature, since He gives up those natural things which He has called into existence in infinite profusion, to one another, and to Man in particular. And is He to bestow on Man what is thus merely material and which is also His, and withhold from him what is spiritual, and refuse to Man what alone can give him true value? It is as absurd to give such ideas a place in our thoughts as it is absurd to say of the Christian religion that by it God has been revealed to Man, and to maintain at the same time that what has been revealed is that He is not now revealed and has not been revealed.

On God's part there can be no obstacle to a knowledge of Him through men. The idea that they are not able to know God must be abandoned when it is admitted that God has a relation to us, and since our spirit has a relation to Him, God exists for us, or, as it has been expressed, He communicates Himself and has revealed Himself. God reveals Himself, it is said, in Nature; but God cannot reveal Himself to Nature, to the stone, to the plant, to the animal, because God is Spirit; He can reveal Himself to Man only, who thinks and is Spirit. If there is no hindrance on God's side to the knowledge of Him, then it is owing to human caprice, to an affectation of humility, or whatever you like to call it, that the finitude of knowledge, the human reason is put in contrast to the divine knowledge and the divine reason, and that the limits of human reason are asserted to be immovable and absolutely fixed. For what is here suggested is just that God is not jealous, but, on the contrary, has revealed and is revealing Himself; and we

have here the more definite thought that it is not the so-called human reason with its limits which knows God, but the Spirit of God in Man, it is, to use the speculative expression previously employed, the self-consciousness of God which knows itself in the knowledge of Man.

This may suffice by way of calling attention to the main ideas which are floating about in the atmosphere of the culture of our time as representing the results of the "Enlightenment," and of an understanding which calls itself reason. These are the ideas which directly meet us, to begin with, when we undertake to deal with the general subject of the knowledge of God. It was possible only to point out the fundamental moments of the worthlessness of those categories which are opposed to this knowledge, and not to justify this knowledge itself. This, as being the real knowledge of its object, must receive its justification along with the content.

Note. — The rendering of *Nichtwissen* in this Lecture by "Agnosticism" involves something of an anachronism, and is not technically strictly accurate; but we have no other English word which seems so well to suggest the meaning. — E.B.S.

SIXTH LECTURE

All questions and investigations regarding the formal element in knowledge we for the present consider as settled or as put on one side. We at the same time escape the necessity of putting in a merely negative form the exposition of what is known as the metaphysical proofs of the existence of God. Criticism which leads to a negative result is not merely a sorry business, but, in confining itself to the task of showing that a certain content is vain, it is itself a vain exercise, an exertion of vanity. In defining those proofs as the grasping in thought of what we have called the elevation of the soul to God, we declared that in criticism we must directly reach an affirmative content.

And so, too, our treatment of the subject is not to be historical. Since time will not permit of me doing otherwise, I must partly refer you to histories of philosophy for the literary portion of the subject, and, indeed, the range of the historical element in these proofs may be held to be of the greatest possible extent, to be universal in fact, since every philosophy has a close connection with the primary question or with subjects which are most intimately related to it. There have, however, been times when this question was treated of in the express form of these proofs, and the interest which was felt in refuting atheism directed attention to them in a supreme degree and secured for them thorough treatment — times when the insight of thought was considered indispensable even in theology in connection with those of its parts which were capable of being known in a rational way. Besides, the historical element in anything which is a substantial content for itself, can and should have an interest for us when we are clear about the thing itself, and that thing which we have got to consider here deserves

above anything else to be taken up for itself, apart from any interest which might otherwise attach to it by its being connected with material lying outside of it. To occupy ourselves too exclusively with the historical element in subjects which are in themselves eternal truths for Spirit, is a proceeding rather to be disapproved of, for it is only too frequently an illusion which deceives us as to what is of real interest. Historical study of this kind has the appearance of dealing with the Thing or actual reality; while, on the contrary, we are as a matter of fact dealing with the ideas and opinions of others, with external circumstances, with what, so far as the actual reality is concerned, is past, transitory, and vain. We may certainly meet with historically learned persons who are what is called thoroughly conversant with all the details of what has been advanced by celebrated men, Fathers of the Church, philosophers, and such like, regarding the fundamental principles of religion, but who, on the other hand, are strangers to the true object or Thing itself. If such people were to be asked what they considered to be the reality and the grounds of their conviction regarding the truth they possessed, they would very likely be astonished at such a question as something which did not concern them here, their real concern being, on the contrary, with others, with theories and opinions, and with the knowledge not of something actual but of theories and opinions.

It is the metaphysical proofs which we are considering here. I make this further remark inasmuch as it has been the custom to deduce a proof of the existence of God, *ex consensu gentium*, a popular category over which Cicero long ago waxed eloquent. The knowledge that *all men* have imagined, believed, known this, carries with it a tremendous authority. How could any man resist it and say, I alone contradict all that all men picture to themselves as true, what many of them have perceived to be the truth by means of thought, and what all feel and believe to be the truth. If, to start with, we leave out of account the force of such a proof, and look at the dry

substance of it which is supposed to rest on an empirical and historical basis, it will be seen to be both uncertain and vague. All that about all nations, all men who are supposed to believe in God, is on a level with similar appeals to all generally; they are usually made in a very thoughtless fashion. A statement, which is necessarily an empirical statement, is made regarding all men, and which covers all individuals, and consequently all times and places; future ones, too, if strictly taken, for we are supposed to be dealing with all men. But it is not possible to get historical evidence regarding all nations. Such statements regarding all men are in themselves absurd, and are to be explained only by the habit people have of not treating seriously such meaningless and trite ways of speaking. But apart from this, nations, or if you choose to call them tribes, have been discovered, whose dull minds, being limited to the few objects connected with their outward needs, had not risen to a consciousness of anything higher which might be called God. What is supposed to be the historical element in the religion of many peoples rests principally on uncertain explanations of sensuous expressions, outward actions, and the like. Of a great many nations, even such as are otherwise highly civilised, and with whose religion we have a more definite and thorough acquaintance, it may be said that what they call God is of such a character that we may well hesitate to recognise it as God. A dispute of the most bitter kind has been carried on between two Roman Catholic monastic orders as to whether the names Thian and Chang-ti, which occur in the Chinese State-religion, the former meaning heaven, and the latter lord, might be used to designate the Christian God, that is to say, as to whether these names did not express ideas which are utterly opposed to our ideas of God, so opposed that they contain nothing in common with ours, not even the common abstract idea of God. The Bible makes use of the expression, "the heathen who know not God," although these heathen were idolaters, i.e., as it is well put, although they had a religion. Here, all

the same, we draw a distinction between God and an idol, and spite of the broad meaning attached in modern times to the name religion, we would perhaps shrink from giving the name God to an idol. Are we to call the Apis of the Egyptians, the monkey, the cow, &c., of the Hindus and other nations, God? Even if we were to speak of the religion of these peoples, and consequently allow that they had something more than a superstition, still we might hesitate to speak of their having belief in God. Otherwise God would be represented by the purely indeterminate idea of something higher of an entirely general character, and not even of something invisible and above sense. One may take up the position that even a bad or false religion should still be called a religion, and that it is better that the various nations should have a false religion rather than none at all, which reminds us of the story of the woman who, to the complaint that it was bad weather, replied that such weather was at least better than no weather at all. Closely connected with this position is the thought that the value of religion is to be found only in the subjective element, in the fact of having a religion, it being a matter of indifference what idea of God is contained in it. Thus belief in idols, just because such a belief can be included under the abstract idea of God in general, is regarded as sufficient, just as the abstract idea of God in general is considered satisfactory. This is certainly the reason, too, why such names as idols and heathen are regarded as something antiquated, and are considered as objectionable because of their invidious meaning. As a matter of fact, however, this abstract antithesis of truth and falsehood demands a very different solution from that given in the abstract idea of God in general, or, what comes to the same thing, in the purely subjective view of religion.

In any case the consensus gentium with regard to belief in God turns out to be a perfectly vague idea, both as regards the element of fact as such expressed in it, and also as regards the substantial element composing it.

But neither is the force of this proof binding in itself, even if the historical basis had been of a firmer and more definite kind. A proof of this kind does not amount to being an individual inner conviction, since it is a matter of accident whether or not others agree with it. Conviction, whether in the form of faith or knowledge based on thought, certainly takes its start from something outside, from instruction, from what is learnt, from authority in fact; still it is essentially an inner act of self-remembrance on the part of Spirit. The fact that the individual himself is satisfied is what constitutes Man’s formal freedom, and is the one moment in presence of which authority of every kind entirely falls away; and the fact that he finds satisfaction in the Thing, in the actual reality, is what makes real freedom, and is the other factor in presence of which, in the very same manner, all authority sinks out of sight. They are truly inseparable. Even in the case of faith the one absolutely valid method of proof referred to in the Scriptures does not consist of miracles, credible accounts and the like, but of the witness of the Spirit. With regard to other subjects we may yield to authority, either from confidence or from fear; but the exercise of the right referred to is at the same time the higher duty laid upon us. In connection with the kind of conviction implied in religious belief in which the innermost nature of Spirit is directly involved, both as regards the certainty of itself (conscience) and because of its content, the individual, in consequence of this, has the absolute right to demand that his own witness and not that of outside minds should be what decides and gives confirmation.

The metaphysical method of proof which we are here considering, constitutes the witness of thinking Spirit in so far as this latter is thinking Spirit not merely potentially, but actually. The object with which it takes to do, exists essentially in thought, and even if, as was previously remarked, it is taken in the sense of something represented in feeling, still the substantial

element in it belongs to thought, which is its pure self, just as feeling is the empirical self, the self which has become specialised or separate. In reference to this object an advance was made at an early period to the stage of thinking, witnessing, that is, proving, so soon, in fact, as thought emerged from its condition of absorption in sensuous and material conceptions and ideas of the sky, the sun, the stars, the sea, and so on, and disengaged itself, so to speak, from its wrapping of pictures of the imagination which were still permeated by the sensuous element — so that Man came to be conscious of God as essentially objectivity which was to be thought of, and which had been reached by thought. So, too, the subjective action of Spirit by a process of recollection brought itself back from feeling, picture-thought, and imagination, to its essence, namely, thought, and sought to have before it what belongs peculiarly to this sphere, and to have it in its pure form as it exists in this sphere. The elevation of the soul to God in feeling, intuition, imagination, and thought — and as being subjective it is so concrete that it has in it something of all these elements — is an inner experience. In regard to it we have likewise an inner experience of the fact that accidental and arbitrary elements enter into it. Consequently there arises on external grounds the necessity for analysing that elevation, and for bringing into clear consciousness the acts and characteristic qualities contained in it, in order that it may be purified from other contingent elements, and from the contingency which attaches to thought itself; and in accordance with the old belief that what is substantial and true can be reached only by reflection, we effect the purification of this act of elevation whereby it attains to substantiality and necessity, by explaining it in terms of thought, and give thought the satisfaction of realising that the absolute right possessed by it has a right to satisfaction totally different from that belonging to feeling and sense-perception or ordinary conception.

SEVENTH LECTURE

THE NECESSITY WE feel of understanding the elevation of the spirit to God from the point of view of thought, is suggested by a formal characteristic which meets us at the very first glance when we consider what direction is taken by the proof of the existence of God, and which has to be taken notice of first of all. The study of a subject from the point of view of thought is an exposition, a differentiation of what in our very first experience we arrive at by a single stroke. In connection with the belief that God is, this analysis comes into direct contact with a point which has already been incidentally touched upon, and is to be dealt with more thoroughly here, namely, the question as to the distinction to be drawn between what God is and the fact that He is. God is; what then does this mean? what is it supposed to be? God is, to begin with, a figurative idea, a name. So far as the two determinations contained in the proposition, namely, God and Being, are concerned, the most important thing is to determine or define the subject for itself, all the more that here the predicate of the proposition which would otherwise be indicated by the peculiar determination of the subject, namely, what this subject is, contains merely dry Being. But then God is for us more than mere Being. And, conversely, just because He is an infinitely richer content than mere Being, and is infinitely different from it, the important thing is to add to it this determination as representing a determination which is different from that of Being. This content which is thus distinguished from Being is an idea, a thought, a conception which is to be explained for itself, and have its meaning determined afterwards. Thus in the Metaphysic of God, or what is known as natural theology, we start by unfolding the meaning of the notion

or conception of God. This is in accordance with the ordinary mode of dealing with the subject, since we consider what our previously formed idea of God contains, and in so doing further presuppose that we all have this idea which we express by the term God. The notion, accordingly, for itself, and apart altogether from the question of its reality, brings with it the demand that it should be true in itself as well, and consequently, as being the notion, that it should be logically true. Since logical truth, in so far as thought takes the form of Understanding merely, is reduced to identity, to what does not contradict itself, nothing more is demanded than that the notion should not contradict itself, or, as it is otherwise expressed, that it be possible, since possibility is itself nothing more than the identity of an idea with itself. The second thing, accordingly, is to show that this notion exists, and this is the proof of the existence of God. But because that possible notion is, in this very matter of identity, of bare possibility, reduced to this the most abstract of categories, and becomes no richer by means of existence, the product thus reached does not answer to the fulness of the idea of God, and we have accordingly a third division of the subject, in which we treat still further of the attributes of God and of His relations to the world.

These are the distinctions which meet us when we begin to examine the proofs of the existence of God. It is the work of the Understanding to analyse what is concrete, to distinguish and to define the elements belonging to it, then to hold firmly to them and abide by them. If at a later stage it once more frees them from their isolation, and recognises that it is their union which constitutes the truth, still they are from this standpoint to be regarded as being true before their union as well, and consequently when outside of this condition of unity. It is accordingly the interest of the Understanding to show that Being essentially belongs to the notion or conception of God, and that this notion must necessarily be thought of as

being or existing. If this is the case, then the notion must not be thought of as separate from Being; it has no real truth apart from Being. The result thus reached is opposed to the idea that the notion should be regarded as true in itself, and as something the existence of which must be assumed, to begin with, and then established. If the Understanding here declares that this first separation made by it and what arises from the separation have no truth, then the comparison, the other separation which further arises in connection with this, is proved to be without any foundation. The notion, that is to say, is to be first considered, and then afterwards the attributes of God are to be dealt with. It is the notion or conception of God which constitutes the content of Being; it can be, and ought also to be, nothing else than the "substance of its realities." But how then should the attributes of God be anything but realities and His realities. If the attributes of God are supposed to express rather His relations to the world, the mode of His action in and towards an Other different from Himself, then the idea of God involves this much at least, that God's absolute independence does not permit Him to come out of Himself, and shows us what happens to be the condition of the world, which is supposed to be outside of Him and to be contrasted with Him, and which we have no right to suppose is already separate from Him. Thus His attributes, His action and mode of existence, remain shut up within His notion, find their determination in it alone, and are essentially nothing more than its relation to itself; the attributes are merely the determinations of the notion itself. But, again, if we start from the world looked at in itself as something which is external so far as God is concerned, so that the attributes of God describe His relations to it, then the world, as a product of His creative power, gets a definite character only through His notion, in which again, consequently, we find, after having followed this unnecessary and roundabout road through the world to God, that the attributes get their definite character, while the notion, if it is not to

be something empty, but, on the contrary, is to be something full of content, is made explicit only through them. It results from this that the differences which we have met with are so formal that they cannot be taken as the basis of any substantial element, or of any particular spheres of existence which, if regarded apart from each other, could be considered as representing something true. The elevation of the spirit to God is found in one thing, in the determination of His notion, of His attributes, and of His Being; or God as notion or idea is the absolutely Indeterminate, and it is only when there is a transition, namely, to Being — and this is the transition in its very first and most abstract form — that the notion and the idea enter on the stage of determinateness. This determinateness, to be sure, is poor enough, but the reason of this just is that the Metaphysic referred to begins with possibility, a possibility which, although it is meant to be that of the notion of God, comes to be the mere possibility of the Understanding, which is devoid of all content, simple identity. Thus we find that in reality we are dealing merely with the final abstractions of thought in general and Being, and with their opposition as well as with their inseparableness, such as we have seen these to be. Since we have pointed out the nullity of the differences with which the metaphysical principle in question starts, we have to remember that only one result follows so far as the process involved in them is concerned, this, namely, that along with the differences we give up the process. One of the proofs which we have to consider will have for its content the very contrast of thought and Being, which we already see making its appearance here, and which will therefore be examined in its proper place in accordance with the value which it itself possesses. Here, however, we might give prominence to the affirmative element which it contains for the knowledge of the at first absolutely general and formal nature of the notion. We must pay attention to this so far as it has reference to the speculative basis and connection of our treatment of the subject in

general. This is an aspect of the question which we merely indicate, whereas in itself it can indeed be nothing else but the truly leading one; but it is not our intention to follow it out in our treatment of the subject, or to confine ourselves to it alone.

It may therefore be remarked by way of preliminary, that what was previously called the notion or conception of God for itself and its possibility, is now to be called thought simply, and indeed abstract thought. A distinction was drawn between the notion of God and the possible existence of God. It was only such a notion which was in harmony with possibility, with abstract identity; and so, too, of what was intended to be taken not as the Notion in general but as a particular notion, in fact as the notion of God, nothing remained but simply this very abstract characterless identity.

It is already implied in what has been said that we cannot take any such abstract determination of the Understanding as applicable to the Notion, but rather that we must simply regard it as concrete in itself, as a unity which is not indeterminate but essentially determinate, and thus only as a unity of determinations; and this unity itself, which is thus joined on to its determinations, is therefore nothing but the unity of itself and its determinations, so that apart from the determinations the unity is nothing and disappears, or, more strictly speaking, it is even degraded to the condition of what is merely an untrue determinateness, and requires to get into relation in order to be true and real. To what has just been said, we may further add that such a unity of determinations — and it is they which constitute the content — is therefore not to be taken as a subject to which they are attached as representing several predicates which would have their bond of union only in it as in a third thing, but would be in themselves outside of this unity and mutually opposed. On the contrary, their unity is to be regarded as belonging essentially to them, that is to say, as a unity which

is constituted solely by the determinations themselves, and, conversely, the separate determinations as such are to be considered as in themselves inseparable from each other, and able to pass over into each other, and as having no meaning taken by themselves apart from one another, so that as they constitute the unity this latter is their soul and substance.

It is this which constitutes the concrete element of the Notion in general. We cannot engage in philosophical speculation regarding any object whatever without employing universal and abstract categories of thought, least of all when God, the profoundest subject of thought, the absolute Notion, is the object, so that it was not possible to avoid pointing out what the speculative notion or conception of the Notion itself is. Here it will be possible to develop this notion only in the way of an historical sketch; that its content is true in-and-for-itself is shown in the logical part of philosophy. Some examples might make it plainer for ordinary thought, and not to go too far — and Spirit, certainly, is always what is nearest — it is sufficient to think of the life-force which is the unity, the simple unit of the soul, and which is at the same time so concrete in itself that it appears only in the form of the process of its viscera, of its members and organs, which are essentially different from it and from each other, and which, yet, when separated from it, perish, and cease to be what they are, namely, life, that is, they no longer have the meaning and signification which belong to them.

We have still to trace in detail the result of the notion or conception of the speculative Notion in the same fashion in which we have dealt with the conception itself. That is to say, since the characteristics of the Notion exist only in its unity, and are therefore inseparable — and in conformity with the character of our object we shall call it the Notion of God — each of these characteristics themselves, in so far as it is taken in itself, and as distinct from any other, must be regarded not as an abstract characteristic, but as a concrete notion or conception of God. But God is at the same time one only,

and accordingly no other relation exists between these notions except the relation which was previously declared to exist among them as characteristics; that is to say, they are to be regarded as moments of one and the same notion, as being necessarily related to each other, as mutually mediating each other, as inseparable, so that they exist only in virtue of their relationship to each other, and this relation is the living unity which comes into existence through them, and is regarded as their hypothetical basis. It is with a view to their thus appearing in different forms that they are implicitly the same notion, only posited differently, and that, in fact, this different way in which they are posited, or different mode of appearance, is in necessary connection with the other, so that the one comes out of the other, and is posited by means of it.

The difference between the Notion in this form and the Notion as such consists, accordingly, merely in this, that the latter has in it abstract determinations representing the aspects it presents, while the Notion in its more determinate form, the Idea namely, has itself concrete aspects within itself for which those universal determinations merely supply a basis. These concrete aspects or sides are, or rather seem to be, a complete whole existing for itself. When it is conceived of as differentiated in them, within the sphere which constitutes their specific determinateness, and likewise in itself, then we get the further determination of the Notion, a multiplicity not only of determinations, but a wealth of definite forms which are accordingly purely ideal, and are posited and contained in the one Notion, in the one subject. And the unity of the subject with itself becomes the more intensive the greater the number of differences developed in it. The further continuous determination or specification which takes place is at the same time a going into itself on the part of the subject, a going down into or absorption of itself in itself.

When we say that it is one and the same Notion which is merely further determined, we are employing a formal expression. Any further and continued determination of what is one and the same adds several determinations to what is thus further defined. This richness in increased determination or specification must not, however, be thought of simply as a multiplicity of determinations, but rather as concrete. These concrete aspects regarded in themselves even take on the form of a complete self-existing whole. But when posited in one notion, in one subject, they are not independent and separate from one another in it, but rather exist ideally, and the unity of the subject accordingly becomes all the more intensive. The greatest intensity of the subject in the ideality of all concrete determinations, of the most complete antitheses, is Spirit. By way of giving a clearer conception of this, we shall refer to the relation of Nature and Spirit. Nature is contained in Spirit, is created by it, and spite of its apparently immediate Being, of its apparently independent reality, it is in itself something merely posited or dependent, something created, something having an ideal existence in Spirit. When in the course of knowledge we advance from Nature to Spirit, and Nature is defined as simply a moment of Spirit, we do not reach a true multiplicity, a substantial two, the one of which would be Nature, and the other Spirit; but, on the contrary, the Idea which is the substance of Nature, having taken on the deeper form of Spirit, retains in itself that content in this infinite intensity of ideality, and is all the richer because of the determination of this ideality itself, which is in-and-for-itself, self-conscious, or Spirit. In connection with this mention of Nature regarded in reference to the several characteristics which we have to treat of in the course of our investigation, we may mention, by way of preface, that it does indeed appear in this shape as the totality of external existence, but at the same time as one of those characteristics above which we are to raise ourselves. Here we do not go on either to consider that

speculative ideality, nor to a study of the concrete shape in which the thought-determination in which it has its root, appears as Nature. The peculiar feature of the stage it occupies certainly forms one of the characteristics of God, a subordinate moment in the same notion. Since in what follows we mean to confine ourselves to its development, and to how the differences continue to be thoughts as such, moments of the Notion, the stage referred to will be regarded not as Nature but as necessity, and life as a moment in the notion or conception of God, which, however, may further be conceived of as Spirit, and possessed of the deeper quality of freedom, in order that it may be a notion or conception of God which would be worthy of Him and also of us.

What has just been said regarding the concrete form of a moment of the notion reminds us of a peculiar aspect of the matter, according to which the characteristics or determinations increase in the course of their development. The relation of the characteristics of God to one another is a difficult subject in itself, and is all the more difficult for those who are not acquainted with the nature of the Notion. But without some acquaintance at least with the notion of the Notion, or, at all events, without having some idea of it, it is not possible to understand anything about the Essence of God as representing Spirit in general. What has been said, however, will get its direct application in that part of our treatment of the subject which immediately follows.

EIGHTH LECTURE

IN THE PRECEDING lecture the speculative fundamental characteristics connected with the nature of the Notion, and its development into the manifoldness of specific qualities and definite forms, have been indicated. If we look once more at the special problem we are dealing with, we find that there, too, we are at once met by a multiplicity. We find that there are several proofs of the existence of God. There is an external empirical multiplicity or difference, which presents itself, first of all, as something which has had an historical origin, and which has nothing to do with the differences which follow from the development of the Notion, and which we take, accordingly, in the form in which we directly come upon it. We may, however, have a feeling of distrust in reference to that multiplicity if we happen to reflect that here we have not to do with a finite object, and remember that our study of an infinite object must be philosophical, and that we are not to deal with it and expend labour upon it in a haphazard and external fashion. An historical fact, nay even a mathematical figure, contains a number of references within it, and relations to what is outside of it, in accordance with which a conception is formed of it, and from which we reason syllogistically to the principal relation upon which they themselves depend, or to another specific quality which is of importance here and which is closely connected with them. It is said that some twenty proofs of the Pythagorean problem have been discovered. The more important an historical fact is, the more points of connection it presents with the circumstances of the time and with other historical events, so that in showing the necessity for accepting the fact as true we may start from any one of these points. The direct testimonies may also be very many in

number, and each testimony in so far as it is not otherwise self-contradictory has in this sphere the force of a proof. If in the case of a mathematical proposition one single example is held to be sufficient, it is principally in connection with historical subjects and juridical cases that a multiplicity of proofs must be held to strengthen the force of the proof itself. In the region of experience or phenomena, the object, as being an empirical and individual thing, has the quality of contingency, and thus the particularity of the knowledge we have of it gives the object the same mere appearance of Being. It is its connection with other facts which gives the object its necessary character, and each of these again belongs in itself to this contingent sphere. Here it is the extension and repetition of such connection which gives to objectivity the kind of universality which is possible in this region. The verification of a fact or a perception by means of the mere number of the observations taken, relieves the subjectivity of perception from the reproach of being an illusion, a deception, or any one of those forms of error which it may by way of objection be declared to be.

In dealing with God since we presuppose the existence of an absolutely general idea of Him, it is found, on the one hand, that He infinitely transcends that region in which all objects whatsoever stand in a connected relation with one another; and that, on the other hand, since God exists only for the inner element of Man's nature in general, we directly meet in this sphere with the contingency of thought, conception, and imagination, in the most varied forms and with what is expressly allowed to be contingency, namely, that of sensations, emotions, and such like. We thus get an infinite number of starting-points from which it is possible to advance to God, and from which we must necessarily advance, and hence the infinite number of such essential transitions which must have the force of proofs. So, too, the verification and confirmation of conviction by means of the repetition of the experiences gained of the way to truth, must appear to be necessary in order

to counteract the infinite possibility of deception and error which, on the other hand, lurks in the way to truth. The individual's trust and the intensity of his belief in God are strengthened by the repetition of the essential elevation of his spirit to God, and by the experience and knowledge he gains of God's wisdom and providence as shown in countless objects, events, and occurrences. In proportion to the inexhaustible number of the relations in which things stand to the one object is the inexhaustible need felt by Man as he enters more and more deeply into the infinitely manifold finitude of his outward surroundings and his inner states, to continuously repeat his experience of God, that is, to bring before his eyes by new proofs the fact of God's working in the world.

When we are in presence of this species of proof we at once feel that it belongs to a different sphere from that of the scientific proof. The empirical life of the individual, composed as it is of the most varied changes of mood and of conditions of feeling consequent on its entrance into different external states, takes occasion both from these states and when it is in them to multiply the result it has arrived at that there is a God, and seeks more and more anew to make this belief its own, and to make it a living belief for itself as being an individual existence subject to change. The scientific field, however, is the sphere of thought. Here the "many times" of the repetition, and the "at all times" which really represents the result, are united together in what is "once." We have to deal with the one thought-determination, which, being one, comprises in itself all those special forms of the empirical life split up as it is into the infinite particularities of existence.

But these different spheres are different only as regards form; the matter of them is the same. Thought only brings the manifold content into a simple shape. It epitomises it without depriving it of its value or of anything that is essential to it. Its peculiar work rather is to bring this essential element into prominence. But here, too, we get various different determinations. First of

all, the thought-determination is seen to be related to the starting-point from which Spirit rises from the finite up to God. Even if it reduces the innumerable characteristics to a few categories, these categories are still several in number. The finite, which has been called in a general way the starting-point, has various characteristics, and these consequently are the source of the different metaphysical proofs of the existence of God, that is to say, the proofs belonging to the sphere of thought only. In accordance with the historical form of the proofs, as we have to deal with them, the categories of the finite in which the starting-points get their definite character are, first, the contingency of earthly things, and next, the teleological relation which they have in themselves and to one another. But besides this finite beginning, finite so far as the content is concerned, there is yet another starting-point, namely, the Notion of God, which so far as its content is concerned is infinite and something that ought to be, and the only finite element in which is that it can be something subjective, an element of which it has to be divested. We may without prejudice admit a variety of starting-points. This does not in itself in any way conflict with the demand which we considered ourselves justified in making that the true proof should be one only; in so far as this proof is known by thought to represent the inner element of thought, thought can also show that it represents one and the same path, although starting from different points. Similarly the result is one and the same, namely, the Being of God. This, however, is a kind of indeterminate Universal. A difference, however, emerges here to which we must give somewhat closer attention. It is intimately connected with what we have called the beginnings or starting-points. These differ according to their starting-points, each of which has a definite content; they are definite categories; the act whereby the spirit rises from them to God is in itself the necessary course of thought, which, in accordance with an expression commonly used, is called a syllogistic argument. This has

necessarily a result, and this result is defined in accordance with the definite character which attaches to the starting-point, for it follows only from this. Thus it comes about that the different proofs of the existence of God result in giving different characteristics or aspects of God. This is opposed to what is considered most probable, and to the opinion that in the proofs of the existence of God the interest centres in the fact of existence only, and that this one abstract characteristic or determination ought to represent the common result of all the different proofs. The attempt to get out of them determinations of the content is rendered unnecessary by the fact that the whole content is found ready to hand in the ordinary idea of God, and this idea thus presupposed, whether in a more definite or in a vaguer form, or in accordance with the ordinary procedure of Metaphysics above referred to, is definitely laid down beforehand, and made to represent the so-called Notion of God. The reflection that the characteristics of the content result from the transitions which take place in the course of reasoning, is not expressly made here, and least of all in connection with the proof which descends to the particular after having started from what had been previously determined, namely, the notion or conception of God, and which is expressly intended merely to satisfy the demand that the abstract characteristic of Being should be attached to that conception.

But it is self-evident that the different premises, and the variety of syllogisms which are constructed by means of these, will also yield several results differing in content. If, accordingly, the starting-points seem to permit us to take the fact of their being distinct from one another as implying a relation of equality or indifference between them, this indifference is of a limited character in view of the results which a multiplicity of characteristics of the conception of God yields; and indeed the primary question regarding their mutual relations crops up of itself in this connection, since God is one. The relation most readily thought of here

is that according to which God is defined as being in His several characteristics one subject consisting of several predicates, as, for instance, when we are in the habit of speaking not only of finite objects which are described by a variety of predicates, but also when we attribute to God a variety of attributes, and speak of Him as being all-powerful, all-wise, as righteousness, goodness, and so forth. The Orientals speak of God as the many-named, or rather as the infinite-all-named, and imagine that the demand to declare what He is can be exhausted only by the inexhaustible statement of His names, that is, of His characteristics or specific qualities. We have already said of the infinite number of starting-points that they are comprised by means of thought in simple categories, and so here the necessity is still greater for reducing the multiplicity of attributes to a smaller number, or rather to one notion, all the more that God is one notion which has in it several inseparable notions; and while we allow with regard to finite objects that each in itself is certainly only one subject, an individual, that is, something indivisible, a notion or conception, we still regard this unity as being in itself manifold, made up of many things external to one another and separable, a unity which is in conflict with itself by the very fact of its existence. The finitude of living beings consists in this, that in them body and soul are separable, and, still more, that the members, nerves, muscles, and so on, the colouring matter, oil, sweat, &c., &c., are also separable; in fact, that what we regard as predicates existing in an actual subject or individual, such as colour, smell, taste, and so on, can separate from each other as independent materials, and that it belongs to the very nature of the unity that it should thus break up into parts. Spirit reveals its finitude in its variety, and in general in the want of correspondence between its Being and its notion. It becomes manifest that the intelligence does not adequately correspond to the truth, the will to the Good, the Moral, and the Right, the imagination to the understanding, and both these to the

reason, and so on, and, besides, that the sense-consciousness with which the whole of existence is always kept supplied, or at any rate nearly so, consists of a quantity of momentary, transitory, and so far untrue elements. This very thorough separability and separateness of the activities, tendencies, aims, and actions of Spirit, which we meet with in empirical reality, may in some degree serve as an excuse for conceiving of the Idea of Spirit as something which breaks up into faculties, capacities, activities, and the like; for it is as an individual form of existence, a definite single being, that it is this particular finite existence which is thus found in a separate form of existence external to itself. But it is God only who is this particular One, and only as He is this One is He God; thus subjective reality is inseparable from the Idea, and consequently cannot be separated in itself. It is here that we see the variety, the separation, the multiplicity of the predicates which are knit into a unity by the subject only, but which in themselves would be in a condition of difference which would result in their coming into opposition and consequently into antagonism with each other, and which would show in the most decided way that they were something untrue, and that multiplicity of characteristics was an unsuitable category.

The next shape taken by the reduction of the several characteristics of God resulting from the several proofs, to the one notion or conception which is to be conceived of as being one in itself, is the ordinary one, according to which they are to be carried back to a higher unity, as it is called, i.e., a more abstract unity, and, since the unity of God is the highest of all, to what is consequently the most abstract form of unity. The most abstract unity, however, is unity itself, and from this it would result that the Idea of God means simply that God is unity — and to express this in terms implying a subject, or at least something which has Being — that He is the One in fact, a description, however, which implies that He is One only as against many, so that the One in Himself might still also be a predicate of

the many, and therefore be unity in Himself, the One Substance rather, or, if you like, Being. But such an abstract form of determination would simply bring us back to this, that what would result from the proof of the existence of God would be simply the Being of God in an abstract sense, or, what comes to the same thing, that God Himself would simply be the abstract One (neuter) or Being, the empty Essence of the Understanding, over against which would be placed the concrete idea of God, which cannot find satisfaction in any such abstract characterisation. But not only is the ordinary idea not satisfied with this abstraction, the Notion looked at in its general aspect is by its very nature concrete itself, and what appears outwardly as difference and multiplicity of characteristics is simply the development of its moments, which all the while remains within itself. It is therefore the inner necessity of reason which shows itself active in thinking Spirit, and produces in it this multiplicity of characteristics; only, since this thought has not yet got a grasp of the nature of the Notion itself, nor consequently of the nature of its relation and the necessity of the connection, what are virtually stages in development appear to be simply an accidental multiplicity, the various elements of which follow on one another and are outside of one another, just as this thought also, moving within the circle occupied by each one of these characteristics, so conceives of the nature of the transition which is called Proof, that the characteristics, while connected with each other, still remain outside of each other, and mediate with each other merely as independent. It does not recognise that mediation with self is the true and final relation in any such process. And it will become evident that this is the formal defect in these proofs.

NINTH LECTURE

IF WE LOOK at the difference which exists between the proofs of the existence of God with which we are dealing, as it actually presents itself, we come upon a distinction which is of an essential kind. One set of the proofs goes from the Being to the thought of God, that is, to put it more definitely, from determinate Being to true Being as representing the Being of God; the other set proceeds from the thought of God, from truth in itself, to the Being of this truth. This distinction, although it is brought forward as one which merely happens to exist in this form, and is of a contingent character, is based on a necessary principle which requires to be taken notice of. We have before us two characteristics — the thought of God and the Being of God. We may start from the one or from the other indifferently in following out the course of reasoning which is supposed to result in their union. Where it is thus a question merely of possible choice, it appears to be a matter of indifference from which we start; and further, too, if the one leads to their being brought into connection, the other appears to be superfluous.

But what thus at first appears to be an indifferent duality and an external possibility has a connection in the Notion, so that neither are the two ways of arriving at the truth indifferent to one another, nor is the difference between them merely of an external character, nor is one of them superfluous. This necessity is not of the nature of an accessory circumstance. It is closely connected with the deepest part of our subject, and chiefly with the logical nature of the Notion. So far as the Notion is concerned, the two paths are not merely different in a general way, but are one-sided, both in reference to the subjective elevation of the spirit to God,

and also in reference to the nature of God Himself. We wish to exhibit this one-sidedness in its more concrete form in reference to our subject. We have before us, to begin with, merely the abstract categories of Being and Notion, the contrast between them and their mode of relationship. It will be shown at the same time how these abstractions and their relations to one another constitute and determine the basis of what is most concrete.

That I may be able to put this thought in a more definite form, I may, by way of anticipation, refer to a further distinction, according to which there are three fundamental modes in which the connection of the two sides or characteristics appears. The first represents the passing over of the one characteristic into its Other; the second, their relativity, or the appearance of the one implicitly or actually in the Being of the Other; the third mode, again, is that of the Notion or the Idea, according to which the characteristic preserves itself in its Other in such a way that this unity, which is itself implicitly the original essence of the two, is considered as their subjective unity. Thus neither of them is one-sided, and they both together constitute the appearance of their unity, which is, to begin with, merely their substance, and thus eternally results from them as being the immanent appearance of totality, and is distinguished from them for itself as their unity, as this eternally unfolds itself in the form of their outward appearance.

The two one-sided ways of elevating the spirit to God thus indicated, accordingly directly exhibit their one-sidedness in a double form. The relations which spring from this call for mention. What has in general to be effected is that in the characteristic of the one side, namely, Being, the other characteristic, namely, the Notion, should appear, and, conversely, that in this latter the first-mentioned should be exhibited. Each determines itself to its Other, gives itself the characteristic of its Other in and out of itself. If, accordingly, only the one side were to determine itself so as to be the other,

this determination would, on the one hand, be merely a passing over, in which the first would lose itself, or, on the other hand, a manifestation of itself, outside of itself, in which each would certainly preserve its independent existence, but would not return into itself, would not be that unity for itself. If we give to the Notion the concrete signification of God, and to Being the concrete signification of Nature, and conceived of the self-determination of God in the form of Nature, as found only in the first of the connections indicated, this would be the process whereby God becomes Nature. But if, according to the second of the connections, Nature is to be taken merely as a manifestation of God, then she, as something in course of transition, would represent the unity inherent in this only for a third thing, only for us, and this would not be unity which is actually present in-and-for-itself, the true unity, determined beforehand. When we put this thought in more concrete forms, and conceive of God as the Idea existing for itself from which we start, and think of Being as also the totality of Being, as Nature, then the advance from the Idea to Nature takes (1) the form simply of a passing over into Nature, in which the Idea is lost and disappears. (2) In order to bring out more clearly the meaning of this transition, we may say that this would be merely an act of remembrance on our part that the simple result had issued from an Other which had, however, disappeared. So far, again, as the outward form is concerned, it would be simply we who had brought the semblance or appearance into relation with its Essence and referred it back to this. Or, looking at the question from a broader standpoint, we may say that God had merely created Nature, not a finite spirit which returns from Nature back to Him; that He had an unfruitful love of the world as of something which was the mere semblance or show of Himself, and which as such remained an Other in relation to Him which did not reflect Him, and through which He did not shine as through Himself. And what is the third thing supposed to be; what are we supposed to be who

have brought this show or semblance into relation with its Essence, and referred it back to its central point, and have been the means whereby the Essence first manifested itself and appeared in itself? What would this third thing be? What would we be? We would represent a knowledge whose existence was presupposed in an absolute way, in fact an independent act of a formal universality which embraced everything in itself, and in which that necessarily existing unity which is in-and-for-itself would itself be included as a mere phenomenon or semblance without objectivity.

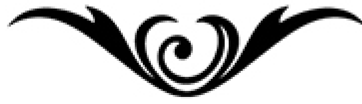
If we form a more definite conception of the relation which is set forth in this determination, then it will be seen that the elevation to God of determinate Being, of Nature, and of natural Being in general, and, along with this, of our consciousness, the active form of this elevation itself, is simply religion or piety which rises to God in a subjective way only, either simply in the shape of an act of transition whereby we disappear in God, or by setting ourselves over against Him as a semblance or illusion. If the finite were thus to disappear in Him, He would be merely the absolute substance, from which nothing proceeds, and into which nothing returns to itself, and even to form ideas of or to think of the absolute substance would be already too much, something which would itself have to disappear. If, however, the relation of reflection is still preserved, the elevation of the pious mind to God, in the sense that religion as such, and consequently the subjective for itself, continues to represent what has Being and is independent, then what is primarily independent or self-existent, and the elevation to which constitutes religion, is something produced by religion, something conceived of, postulated, thought or believed, an appearance or semblance merely, not anything truly independent which starts from itself. It is substance as an idea merely, which does not decide for itself, and which consequently is not the activity which as activity is found only in the subjective elevation as such. It would not in this case be known and

recognised as true that God is the Spirit who Himself arouses in men that desire to rise to Him, that religious feeling in which the elevation begins.

If from this one-sidedness there results a broader idea and a further development of what does not, to begin with, get beyond something which has the character of a reflex semblance, and if we thus reach its emancipation, in which it, as being independent and active, would in its turn be defined as not-semblance, then we would attribute to this independent existence merely a relative, and consequently a half connection with its other side, which contained in it itself a non-communicating and incommunicable kernel which had nothing to do with the Other. We would be dealing merely with the superficial form, in which the two sides were apparently related to each other, and which would not imply a relation springing from their essence and established by their essence. Both sides consequently would be wanting in the true, total return of Spirit into itself, and Spirit would thus not search into the deep things of the Godhead. But this return into itself and this searching into the Other are essentially coincident; for mere immediacy, substantial Being, does not imply anything deep. It is the real return into self which alone makes the depths of God, and it is just the act of searching into the Essence which is return into self.

We may stop here with this preliminary reference to the more concrete sense of the difference indicated, and which we discovered by means of reflection. What had to be called attention to was that the difference is not a superfluous multiplicity; further, that the division springing from it, and which was, to begin with, of a formal and external character, contains two characteristics — Nature, natural things, and the progress of consciousness to God and from Him back to Being, both of which equally and necessarily belong to one conception, and this quite as much in the course of the subjective procedure of knowledge as when they have an absolutely objective concrete sense, and, regarded each for itself, present a one-

sidedness of a most important kind. So far as knowledge is concerned, their integration is found in the totality which the Notion in general represents, and, more strictly speaking, in what was said about it, namely, that its unity as a unity of the two moments is a result representing the most absolute basis and result of the two moments. Without, however, presupposing this totality and its necessity, it will follow from the result of the one movement — and since we are beginning we can begin only in a one-sided way from the one — that by its own dialectic nature it forces itself to go over into the other, and passes from itself over into this complete integration. The objective signification of what is, to begin with, a merely subjective conclusion will, however, at once make it evident that the inadequate, finite form of that proof is done away with. Its finitude consists, above all, in this one-sidedness which attaches to its indifference and its separation from the content. When this one-sidedness has been done away with and absorbed, it comes to have the content also in itself in its true form. The process of elevation to God is in itself the abolition of the one-sidedness of subjectivity in general, and, above all, of knowledge.



To the distinction which, regarded from the formal side, appears as a difference in the kinds of the proofs of the existence of God, there has yet to be added the fact that if we look at the proof from the one side according to which we pass from the Being of God to the conception of God, it presents itself under two forms.

The first proof starts from the Being which as something contingent does not support itself, and from this reasons to a true necessary Being in-and-for-itself — this is the proof *ex contingentia mundi*.

The other proof starts from Being in so far as it has a definite character determined in accordance with relations implying an end, and reasons to a wise author of this Being — this is the Teleological Proof of the existence of God.

We have still to deal with the other side, according to which the notion or conception of God is made the starting-point, and from which we reason to its Being — the Ontological Proof. As this is the plan we mean to follow out, there are thus three proofs which we have to consider; and also, as being of no less importance, we have to consider the criticism which has been given of them, and owing to which they have been discarded and forgotten.

TENTH LECTURE

THE PROOFS WE have to deal with, regarded in their first aspect, presuppose the world in general, and, above all, its contingency. The starting-point is constituted by empirical things, and by the Whole composed of these things, namely, the world. The Whole is certainly superior to its parts, the Whole, that is to say defined as the unity which embraces and gives their character to all the parts, as, for instance, even when we speak of the Whole of a house, and still more in the case of that Whole which is a self-existent unity, as the soul is in reference to the living body. By the term world, however, we understand the aggregate of material things, the collection merely of that infinite number of existing things which are actually visible, and each of which is, to begin with, conceived of as existing for itself. The world embraces men equally with natural things. When the world is thus taken as an aggregate, and even as an aggregate merely of natural things, it is not conceived of as Nature, by which we understand something which is in itself a systematic Whole, a system of arrangements and gradations, and particularly of laws. The term world as thus understood expresses the aggregate merely, and suggests that it is based simply on the existing mass of things, and has thus no superiority, no qualitative superiority at least, over material things.

So far as we are concerned, these things further determine themselves in a variety of ways, and chiefly as limited Being, finitude, contingency, and so on. This is the kind of starting-point from which the spirit raises itself to God. It adjudges limited, finite or contingent Being to be untrue Being, above and beyond which true Being exists. It escapes into the region of another, unlimited Being, which represents the Essence as opposed to that

unessential, external Being. The world of finitude, of things temporal, of change, of transitoriness, is not the true form of existence, but the Infinite, Eternal, and Unchangeable. And even if what we have called limitless Being, the Infinite, Eternal, and Unchangeable, does not succeed in expressing the absolute fulness of meaning contained in the word God, still God is limitless Being, He is infinite, eternal, and unchangeable, and thus the spirit rises at least to those divine predicates or to those fundamental qualities of His nature which, though abstract, are yet universal, or at least to that universal region, to the pure æther in which God dwells.

This elevation of the soul to God is, speaking generally, that fact in the history of the human spirit which we call religion, but religion in a general sense, that is, in a purely abstract sense, and thus this elevation is the general, but merely the general, basis of religion.

The principle of immediate knowledge does not get beyond this elevation as a fact. It appeals to it, and rests in it as a fact, and asserts that it represents that universal fact in men, and even in all men, which is called the inner revelation of God in the human spirit, or reason. We have already sufficiently examined this principle, and I accordingly refer to it once more only in so far as we here confine our attention to the fact in question. This very fact, the act of elevation to God namely, is as such rather something which is directly of the nature of mediation. It has its beginning and starting-point in finite, contingent existence, in material things, and represents an advance from these to something else. It is consequently mediated by that beginning, and is an elevation to what is infinite and in itself necessary, only inasmuch as it does not stop short at that beginning which is here alone the Immediate (and this an Immediate which afterwards exhibits a merely relative character), but rises to the Infinite by the mediate step of the abandonment and renunciation of such a standpoint. This

elevation which is represented by consciousness, is consequently in itself mediated knowledge.

With regard to the point from which this elevation starts, we may here further remark that the content is not of a sensuous kind, not an empirical concrete content composed of sensation or perception, nor a concrete content of imagination — the truth rather being that the abstract thought-determinations implied in the ideas of the finitude and contingency of the world form the starting-point. The goal at which the elevation arrives is of a similar kind, namely, the infinitude or absolute necessity of God, conceived of not as having a more developed and richer determination, but as being wholly within the limits of these general categories. With regard to this aspect of the question it is necessary to point out that the universality of the fact of this elevation is false so far as its form is concerned. For instance, it can be maintained that even amongst the Greeks the thought of infinity, of inherently existing necessity as representing the ultimate principle of all things, was the possession of the philosophers only. Material things did not appear in this general way to the popular conception in the abstract form of material things and as contingent and finite things, but rather in their empirical and concrete shape. So in the same way God was not conceived of under the category of the Infinite, the Eternal, the inherently Necessary, but, on the contrary, in accordance with the definite shapes created by the imagination. Still less is it the case that those nations who occupied a lower stage of culture put their conceptions in any such actually universal forms. These general forms of thought do certainly pass through men’s minds, as we say, because men are thinking beings, and when they have received a fixed form in language they are still further developed into the conscious thought upon which the proof proper is based, but even in that case they take, to begin with, the form of characteristics of concrete objects; they don’t require to get a fixed place in consciousness as independent in their

own right. It was to the culture of our time that these categories of thought first became familiar, and they are now universal, or at least universally diffused. But those very people who have shared in this culture, and no less those who have been referred to as unpractised in the independent exercise of thought based on general conceptions, have not reached this idea in any immediate way, but, on the contrary, by following the varied course of thought, and by the study of the sense in which words are used. People have essentially learned to think, and have given currency to their thoughts. The culture which is capable of abstract conception is something which has been reached through mediation of an infinitely manifold character. The one fact in this fact of the elevation of Man to God is that it is a mediation.

It is this circumstance, namely, that the elevation of the spirit to God has mediation in itself, which invites to proof, that is, to the explication of the separate moments of this process of the spirit, and to their explication in the form of thought. It is the spirit in its most inward character, that is, in its thought, which produces this elevation, which in its turn represents the course followed by the thought-determinations or characteristic qualities of thought. What is intended to be effected by this process of proof is that this activity of thought should be brought into consciousness, that consciousness should recognise it as representing those moments of thought in a connected form. Against this unfolding of these moments which shows itself in the region of mediation through thought, faith, which wishes to continue to be immediate certainty, protests, and so, too, does the criticism of the Understanding, which is at home in the intricacies of that mediation, and is at home in the latter in order that it may introduce confusion into the elevation itself. So far as faith is concerned, we may say that however many faults Understanding may find with these proofs, and whatever defective points there may be in their manner of unfolding the moments of the elevation of the spirit from the accidental and temporal to the infinite and

eternal, the human heart will not allow itself to be deprived of this elevation. In so far as the human heart has been checked in this matter of elevation to God by the Understanding, faith has, on the one hand, appealed to it to hold fast by this elevation, and not to trouble itself with the fault-finding of the Understanding; but it has, on the other hand, told itself not to trouble about proof at all, in order that it may reach what is the surest standing ground, and in the interest of its own simplicity it has ranged itself on the side of the critical Understanding in direct opposition to proof. Faith will not allow itself to be robbed of its right of rising to God, that is, of its witness to the truth, because this is inherently necessary, and is more than any single chance fact connected with Spirit. There are facts, inner experiences in Spirit, and still more are there in the individual spirits — for Spirit does not exist as an abstraction, but in the form of many spirits — facts of an infinitely varied sort, and sometimes of the most opposite and depraved character. In order that this fact may be rightly conceived of as a fact of Spirit as such, and not merely as a fact belonging to the various ephemeral contingent spirits, it is requisite to conceive of it in its necessary character. It is this necessary character which alone vouches for its truth in this contingent and arbitrary sphere. The sphere to which this higher fact belongs is, further, essentially the sphere of abstraction. Not only is it very difficult to have a clear and definite consciousness of what abstraction is and what is the nature of its inner connection, but this power of abstraction is itself the real danger, and this is a danger which is unavoidable when abstraction has once appeared, when the believing human spirit has once tasted of the Tree of Knowledge, and thought has begun to spring up within it in the free and independent form which peculiarly belongs to it.

If, accordingly, we look more narrowly at the inner course followed by Spirit in thought and its moments, it will be seen, as has been already observed, that the first starting-point represents a category of thought,

namely, that of the contingency of natural things. The first form of the elevation of the spirit to God is represented historically by the so-called Cosmological Proof of the existence of God. It has also been pointed out that on the definiteness of the starting-point depends also the definiteness of the goal which we wish to reach. Natural things might be defined in another way, and in that case the result or the truth would also be differently defined. We might have differences which would appear unimportant to very imperfectly developed thought, but which from that standpoint of thought which we at present occupy would be seen to be the very thing with which we were really concerned and which has to be reckoned with. If things were thus defined in a general way as existing, it might be shown that the truth of existence as determinate Being, was Being itself, indeterminate, limitless Being. God would thus be defined as Being — the most abstract of all definitions, and the one with which, as is well known, the Eleatics started. We recall this abstraction most vividly in connection with the distinction already made between thought in its inner and implicit form and the bringing forward of thoughts into consciousness. Who is there who does not use the word Being? (The weather is fine. Where are you? and so on, ad infinitum.) And who, in forming conceptions, does not make use of this pure category of thought, though it is concealed in the concrete content (the weather, and so on, ad infinitum), of which consciousness in forming any such conceptions is composed, and of which alone, therefore, it has any knowledge? There is an infinite difference between the possession and employment of the category of thought called Being in this way, and its employment by the Eleatics, who gave it a fixed meaning in itself, and conceived of it as the ultimate principle, as the Absolute, along with God at least, or apart from any God at all. Further, when things are defined as finite, Spirit has risen from them to what is infinite; and when they are defined at the same time as real Being, then Spirit has risen to the Infinite as

representing what is ideal or ideal Being. Or if they are expressly defined as having Being in a merely immediate way, then Spirit rises from this pure immediacy, which is a mere semblance of Being, to the Essence, and regards this as representing the ground or basis of Being. It may again rise from them as representing parts, to God as representing the Whole; or from them as external and selfless things, to God as representing the force behind them; or from them as effects, to their cause. All these characteristics are applied to things by thought, and in the same way the categories of Being, the Infinite, the Ideal, Essence and Ground, the Whole, Force, Cause, are used to describe God. It is implied that they may be employed to describe Him, yet still as suggesting that though they may be validly applied to Him, and though God is really Being, the Infinite, Essence, the Whole, Force, and so on, they do not, all the same, exhaust His nature, which is deeper and richer than anything such determinations can express. The advance from any such determination of existence taken as a starting-point and as representing the finite in general, to its final determination, that is, to the Infinite in thought, deserves the name Proof exactly in the same way as those proofs to which the name has been formally given. In this way the number of proofs goes far beyond that of those already mentioned. From what standpoint are we to regard this further increase in the number of the proofs which have thus grown up in what is perhaps for us an unpleasant way? We cannot exactly reject this multiplicity of arguments. On the contrary, when we have once placed ourselves at the standpoint of those mediations of thought which are recognised as proofs, we find we have to explain why in thus adducing them we have confined, and can confine, ourselves just to the number mentioned, and to the categories contained in them. In reference to this new and further extended variety of proofs, we have to think principally of what was said in connection with those which appeared at an earlier stage and in a more limited shape. This multiplicity of

starting-points which thus presents itself is nothing else than that large number of categories which naturally belong to the logical treatment of the subject. We have merely to indicate the manner in which they point to this latter. They show themselves to be nothing but the series of the continuous determinations which belong to the Notion, and not to any one notion, but to the Notion in itself. They represent the development of the Notion till it reaches externalisation, the condition in which its elements are mutually exclusive, though it has really gone deeper into itself. The one side of this continuous advance is represented by the finite definiteness of a form of the Notion; the other, by its most obvious truth, which is in its turn simply the truth in a more concrete and deeper form than that which preceded it. The highest stage in one sphere is at the same time the beginning of a higher stage. It is logic which unfolds in its necessity this advance in the determination of the Notion. Each stage through which it passes so far involves the elevation of a category of finitude into its infinitude, and it thus likewise involves from its starting-point onwards a metaphysical conception of God, and, since this elevation is conceived of in its necessity, a proof of His Being. Thus also the transition from the one stage to the higher stage presents itself as a necessary advance in more concrete and deeper determination, and not only as a series of random conceptions, and so as an advance to perfectly concrete truth, to the full and perfect manifestation of the Notion, to the equating or identification of these its manifestations with itself. Logic is, so far, metaphysical theology, which treats of the evolution of the Idea of God in the æther of pure thought, and thus concerns itself peculiarly with this Idea, which is perfectly independent in-and-for-itself.

Such detailed treatment is not the object of these lectures. We wish to confine ourselves here to the historical discussion of those characteristics of the Notion the rising from which to the characteristics of the Notion which are its truth, and which may be held to be the characteristics of the Notion

of God, is the point to be considered. The reason of the general incompleteness which marks that method of taking up the characteristics of the Notion can only be found in the defective ideas prevalent with regard to the nature of the characteristics of the Notion itself, and of their mutual connection, as well as of the nature of the act of rising from them as finite to the Infinite. The more immediate reason why the characteristic of the contingency of the world and that of the absolutely necessary Essence which corresponds to it appear as the starting-point and as the result of the proof respectively — and this reason is at the same time a relative justification of the preference given to them — is to be looked for in the fact that the category of the relation between contingency and necessity is that in which all the relations of the finitude and the infinitude of Being are resumed and comprised. The most concrete determination of the finitude of Being is contingency, and in the same way the infinitude of Being in its most completely determined form is necessity. Being in its own essentiality is reality, and reality is in itself the general relation between contingency and necessity which finds its complete determination in absolute necessity. Finitude, by being taken up into this thought-determination, has the advantage, so to speak, of being so far prepared by this means as to point in itself to the transition to its truth or necessity. The term contingency, or accident, already suggests a kind of existence whose special character it is to pass away.

Necessity itself, however, has its truth in freedom; with it we enter into a new sphere, into the region of the Notion itself. This latter accordingly affords another relation for the determination of elevation to God and for the course it follows, a different determination both of the starting-point and the result, and, first of all, the determination of what is conformable to an end, and that of the End. This accordingly becomes the category for a further proof of the existence of God. But the Notion is not something

merely submerged in objectivity, as it is when regarded as an end, in which case it is merely the determination of things; but, on the contrary, it is for itself, and exists independently of objectivity. Regarded in this light, it is itself the starting-point, and its transition has a determination of its own, which has been already referred to. The fact, therefore, that the first Proof, the Cosmological Proof, adopts the category of the relation of contingency and absolute necessity, finds, as has been remarked, its relative justification in this, that this relation is the most individual, most concrete, and, in fact, the ultimate characteristic of reality as such, and accordingly represents and comprises in itself the truth of the more abstract categories of Being taken collectively. The movement of this relation likewise includes the movement of the earlier, more abstract characteristics of finitude to the still more abstract characteristics of infinitude; or rather, it is, in a logically abstract sense, the movement, or procedure of the proof, that is, it is the form of syllogistic reasoning, in all cases only one and the same, which is represented in it.

As is well known, the effect of the criticism directed by Kant against the metaphysical proofs of the existence of God has been that these arguments have been abandoned, and that they are no longer mentioned in any scientific treatise on the subject; in fact, one is almost ashamed to adduce them at all. It is allowed, however, that they may be used in a popular way, and these helps to truth are universally employed in connection with the instruction of youth, and the edification of those who are grown up. So, too, that eloquence which has for its principal aim to warm the heart and elevate the feelings necessarily takes and uses them as the inner fundamental and connecting principles of the ideas with which it deals. With regard to the so-called Cosmological Proof, Kant ("Critique of Pure Reason," 2nd edition,) makes the general remark that if we presuppose the existence of anything, we cannot avoid what follows from this, namely, that something or other

exists in a necessary way, and that this is an absolutely natural conclusion; and he goes on further to remark, at , with regard to the Physico-theological Proof, that "it ought always to be mentioned with respect, since it is the oldest, the clearest, and the one most in harmony with ordinary human reason." He declares that "it would not only be a comfortless task, but an absolutely useless one, to attempt to detract in any way from the authority of this proof." He holds, further, that "reason can never be so far repressed by any doubts suggested by subtle abstract speculation as to be unable to extricate herself from any such burrowing indecision as from a dream, by the mere glance which she directs to the wonders of Nature and the majesty of the universe, in order thus to go from one form of greatness to another until the highest of all is reached, and to rise from the conditioned to the condition, until she arrives at the supreme and unconditioned Author of all."

If, then, the proof first adduced expresses an unavoidable conclusion from which it is impossible to escape, and if it would be absolutely useless to seek to detract from the authority of the second proof, and if reason can never be so far repressed as to renounce this method of proof and not to rise through it to the unconditioned Author of all, it must certainly appear strange that we should evade the demand referred to, and if all the while reason be held to be so entirely repressed that it no longer attaches any weight to this proof. But just as it may appear to be a sin against the good society of the philosophers of our time to continue to mention those proofs, it equally appears that the philosophy of Kant, and Kant's refutations of those proofs, are something which we have long ago done with, and which is therefore not to be mentioned any more.

The fact, however, is that it is Kant's criticism alone which has done away with these proofs in a scientific way, and which has itself become the source of the other and shorter method of rejecting them, that method, namely, which makes feeling alone the judge of truth, and asserts not only

that thought is superfluous, but that it is damnable. In so far, then, as we are concerned in getting to know the scientific reasons for which these proofs have lost their authority, it is Kant's criticism alone with which we are called to deal. It is, however, to be noticed, further, that the ordinary proofs which Kant subjects to criticism, and in particular the Cosmological and Physico-theological Proofs, whose method we are here considering, contain characteristics of a more concrete kind than the abstract merely qualitative characteristics of finitude and infinitude. Thus the Cosmological Proof contains the characteristics of contingent existence and of absolutely necessary Essence. It has also been observed that even when the antitheses are expressed by the terms conditioned and unconditioned, or by accident and substance, they still necessarily have here this merely qualitative meaning. Here, accordingly, the really essential point to be dealt with is the formal procedure of the mediation connected with the proof; and, besides, the content and the dialectic nature of the characteristics themselves are not dealt with in the metaphysical syllogisms referred to, nor in Kant's criticism either. It is, however, just the mediation of this very dialectic element which it is necessary to carry through and pass judgment upon. For the rest, the particular mode in which the mediation in those metaphysical lines of argument, as well as that belonging to Kant's estimate of them, is to be conceived of, is, as a whole, the same; and this is true of all the separate proofs of the existence of God, that is, of all those belonging to the class which starts from some given form of existence. And if we here look more closely at the nature of this syllogism of the Understanding, we shall have also settled its character so far as the other proofs are concerned, and in dealing with them we shall have to direct our attention merely to the content of the characteristics in its more definite form.

The consideration of Kant's criticism of the Cosmological Proof comes to be all the more interesting from the fact that, according to Kant, this

proof has concealed in it “a whole nest of dialectic assumptions, which, nevertheless, transcendental criticism is able to lay bare and destroy.” I shall first restate this proof in the form in which it is usually expressed, which is the one employed by Kant, and which runs thus: If anything exists — not merely exists, but exists a contingentia mundi, is defined as contingent — then some absolutely necessary Essence must exist as well. Now I myself at least exist, and therefore an absolutely rational Essence exists. Kant remarks, first of all, that the minor term contains something derived from experience, and that the major term concludes from experience in general that something necessary exists; that consequently the proof is not carried through in an absolutely a priori way, a remark which connects itself with what was mentioned before as to the general nature of this style of argument, which takes up merely one aspect of the total true mediation.

The next remark has reference to a point of supreme importance in connection with this style of argument, and which Kant expresses in the following form. The necessary Essence can be characterised as necessary only in one single mode, that is, in respect of all possible opposing predicates only by means of one of these, and consequently there can be only one single conception of any such thing, namely, that of the most real Essence — a conception which confessedly forms the subject of the Ontological Proof, to be dealt with much later on.

It is against this latter more comprehensive characteristic of necessary Essence that Kant first of all directs his criticism, and which he describes as a mere refinement of reasoning. The empirical ground of proof above mentioned cannot tell us what are the attributes of this necessary Essence. To reach these, reason has absolutely to part company with experience, and to seek in pure conceptions what kind of attributes or qualities an absolutely necessary Essence must possess, and what thing amongst all possible things has the requisite qualifications which should belong to an absolute

necessity. We might attribute to the age the many marks of want of intellectual training which characterise these expressions, and be willing to admit that anything like this is not to be found in the scientific and philosophical modes of statement current in our day. At all events, God would not in these days be any longer qualified as a thing, nor would we try to seek amongst all possible things some one thing which should suit the conception of God. We speak indeed of the qualities or attributes of this or that man, or of Peruvian bark, and such like; but in philosophical statements we do not speak of attributes in reference to God as a thing. Only we all the more frequently hear conceptions spoken of simply as abstract specific forms of thought, so that it is no longer necessary to indicate what we mean when we ask information regarding the notion or conception of anything, or when, in fact, we wish to form a conception of any object. It has, however, quite become a generally accepted principle, or rather it has come to form part of the belief of this age, that reason should be reproached with putting its investigations in the form of pure conceptions, and even that this should be reckoned a crime; in other words, it is blamed for showing itself active in a way different from that of sense-perception, or from that followed by imagination and poetry. In the case of Kant we see, at any rate, in his treatment of the subject, the definite presuppositions from which he starts, and the logical result of the reasoning process he follows, so that any opinion arrived at is expressly reached and proved by means of principles, and it is held that any view must be deduced from principles, and be, in fact, of a philosophical kind. In our day, on the contrary, if we go along the highway of knowledge, we meet with the oracular utterances of feeling, and the assertions of the individual person who has the pretension to speak in the name of all men, and as a consequence of this pretends that he has also a right to impose his assertions upon everybody. There cannot possibly be any kind of precision in the characteristics which spring from such sources of

knowledge, nor in the form in which they are expressed, nor can they lay claim to be logical or to be based on principles or grounds.

That part of Kant's criticism referred to suggests the definite thought, first of all, that the proof we are dealing with leads us merely to the idea of a necessary Essence, but that any such characteristic is different from the conception of God, that is, from the characteristic of the most real Essence, and that this latter must be deduced by reason from the former by means of conceptions pure and simple. It will at once be seen that if this proof does not bring us any further than to the idea of an absolutely necessary Essence, the only objection which could be urged against it would be, that the idea of God which is limited to what is implied in this characteristic is at any rate not such a profound idea as we, whose conception of God is more comprehensive, wish for. It is quite possible that individuals and nations belonging to an earlier age, or who, while belonging to our age, are living outside the pale of Christianity and of our civilisation, might have no more profound idea of God than this. For all such, this proof would consequently be sufficient enough. We may, in any case, allow that God and God only is the absolutely necessary Essence, even if this characteristic does not exhaust the Christian idea, which, as a matter of fact, includes in it something more profound than the metaphysical characteristic of so-called natural theology — something more profound, too, than what is found in the conception of God which belongs to immediate knowledge and faith. It is itself questionable if immediate knowledge can even say this much of God, that He is the absolutely necessary Essence; at any rate, if one person can know this much of God immediately, another may equally well not know so much of Him immediately in the absence of any right on the part of any one to expect more of him, for a right implies reasons and proofs, that is, mediations of knowledge, and mediations are excluded from and forbidden to immediate knowledge of this kind.

But if the development of what is contained in the characteristic of absolutely necessary Essence gives us still further characteristics as duly following from it, what objection can there be to accepting these, and to being convinced of their validity? The ground of proof may be empirical; but if the proof is in itself a properly deduced consequence, and if the existence of a necessary Essence is once for all established by this consequence, reason starting from this basis pursues its investigations by the aid of what are purely conceptions; but this can be reckoned an unjustifiable act only when the employment of reason in general is considered wrong, and, as a matter of fact, Kant carries the degradation of reason as far as those do who limit all truth to immediate knowledge.

However, the characteristic of the so-called most real Essence is easily deducible from the characteristic of the absolutely necessary Essence, or even from the characteristic of the Infinite, beyond which we have not gone, for all and every limitation contains a reference to an Other, and is consequently opposed to the characteristic of the Absolutely-necessary and Infinite.

The real illusion or fallacy in the mode of inference which is supposed to belong to this proof, is sought for by Kant in the proposition that every purely necessary Essence is at the same time the most real Essence, and he holds that this proposition is the *nervus probandi* of the Cosmological Proof. He seeks, however, to expose the fallacy by pointing out that, since a most real Essence is not one whit different from any other Essence, the proposition permits of being simply inverted, that is, any — and by this is meant the most real — Essence is absolutely necessary, or, in other words, the most real Essence which as such gets its determinate nature by means of the Notion, must also contain within it the characteristic of absolute necessity. This, however, is just the principle and method of the Ontological Proof of the existence of God, which consists in this, that it starts from the

notion or conception, and passes by means of the conception to existence. The Cosmological Proof uses the Ontological as a prop, since it promises to conduct us by a new footpath, and yet after a short detour brings us back to the old one, the existence of which it refused to admit, and which we abandoned for its sake.

It will be seen that the objection does not touch the Cosmological Proof, either in so far as this latter merely attains by itself to the characteristic of something absolutely necessary, or in so far as it advances from this by way of development to the further characteristic of what is most real. So far as this connection between the two characteristics in question is concerned, it being the point against which Kant particularly directs his objections, we can see that it is quite in accordance with the nature of proof that the transition from one already established characteristic to a second, or from a proposition already proved to another, should permit of being clearly exhibited; but we can see, too, that reasoned knowledge cannot go back in the same way from the second to the first, and cannot deduce the second from the first. Euclid first demonstrated the proposition of the known relation between the sides of a right-angled triangle by starting from this definite quality of the triangle, and deducing the relationship of the sides from it. Then the converse proposition was also demonstrated, and in this case he started from the fact of this relation, and deduced from it the right-angled character of the triangle, the sides of which had that relation to one another, and yet this was done in such a way that the demonstration of this second proposition presupposed and made use of the first. In another instance this demonstration of the converse proposition is given apagogically by presupposing the first. Thus the proposition, that if in a rectilineal figure the sum of the angles is equal to two right angles, the figure is a triangle, can be easily proved to follow apagogically from the proposition previously demonstrated that in a triangle the three angles

together make two right angles. When it is shown that a predicate belongs to an object, we must go further if we are to show that such a predicate belongs to it exclusively, and that it is not merely one of the characteristics of the object which may belong to others as well, but that it is involved in the definition of the object. This proof might be stated in various ways, and is not compelled exactly to follow one single path, namely, that which starts from the conception of the second characteristic. Besides, in dealing with the connection between the so-called most real Essence and the absolutely necessary Essence, it is only one aspect of this latter that we have to take directly into account, and we have nothing at all to do with that aspect in reference to which Kant brings forward the difficulty discovered by him in the Ontological Proof. The characteristic of absolutely necessary Essence involves the necessity partly of its Being, partly of the characteristics of its content. If it be asked what is implied in the further predicate, the all-embracing, unlimited reality, the reply is that this question has no reference to Being as such, but to what is to be further distinguished as the characteristic of the content. In the Cosmological Proof, Being has already a definite existence of its own, and the question as to how we pass from absolute necessity to the All-Reality, and back from the latter to the former, has reference to this content only, and not to Being. Kant finds the defect of the Ontological Proof in the fact that in connection with its fundamental characteristic, the All of realities, Being is likewise conceived of as a reality. In the Cosmological Proof, however, we have already this Being elsewhere. Inasmuch as it adds the characteristic of All-Reality to what is for it absolutely necessary, it does not at all require that Being should be characterised as reality, and that it should be comprised in that All-Reality.

Kant in his criticism begins by taking the advance of the characteristic of the Absolutely-necessary to unlimited reality only in this sense, since, as was previously indicated, for him the point of this advance is the discovery

of the attributes possessed by the absolutely necessary Essence, as the Cosmological Proof in itself has made only one step in advance, namely, to the existence of an absolutely necessary Essence in general, but cannot tell us what kind of attributes this Essence possesses. We must therefore hold that Kant is in error in asserting that the Cosmological Proof rests on the Ontological, and we must regard it as a mistake even to maintain that it requires this latter to complete it, that is, in regard to what it has in general to accomplish. That more, however, has to be accomplished than it accomplishes, is a matter for further consideration, and this further step is undoubtedly taken in the moment contained in the Ontological Proof. But it is not the need of thus going further, upon which Kant grounds his objection to this proof. On the contrary, his argument is conducted from points of view which lie wholly within the sphere of this proof, and which do not touch it.

But the objection referred to is not the only one which Kant brings forward against the line of argument followed by the Cosmological Proof. He goes on () to expose the "further assumptions," a "whole nest" of which, he declares, is concealed in it.

It contains, above all, the transcendental principle according to which we reason from what is contingent to a cause. This principle, however, applies in the world of sense only, and has no meaning whatever outside of it. For the purely intellectual conception of the contingent cannot possibly produce a synthetic proposition such as that of causality, a proposition which has a meaning and a use merely in the world of sense, but which is supposed to help us to get beyond the world of sense. What is maintained here, on the one hand, is the well-known doctrine, which is Kant's main doctrine, of the inadmissibility of getting beyond sense by means of thought, and of the limitation of the use and meaning of the categories of thought to the world of sense. The elucidation of this doctrine does not come within the scope of

our present treatment of the subject. What has to be said on this point may be summed up in the following question: If thought cannot pass beyond the world of sense, would it not be necessary, on the other hand, to show first of all how it is conceivable that thought can enter into the world of sense? The other assertion is that the intellectual conception of the contingent cannot form the basis of a synthetic proposition such as that of causality. As a matter of fact, it is by means of this intellectual category of contingency that the temporal world as present to perception is conceived of; and by employing this very category which is an intellectual one, thought has already passed beyond the world of sense, and transferred itself to another sphere, without having found it necessary to endeavour to pass beyond the world of sense by using first of all the category of causality. Then, again, this intellectual conception of the contingent is supposed to be incapable of producing a synthetic proposition such as is involved in the idea of causality. As a matter of fact, however, it has to be shown that the finite passes through itself, through what it is meant to be, through its own content, to its Other, to the Infinite itself; and this is what forms the basis of a synthetic proposition according to Kant's use of the term. The nature of the contingent is of a similar kind. It is not necessary to take the category of causality as referring to the Other into which contingency passes over; on the contrary, this Other is, to begin with, the absolute necessity, and is consequently Substance also. The relation of substantiality, however, is itself one of those synthetic relations which Kant refers to as the categories, and this just means that "the purely intellectual characteristic of the contingent" — for the categories are essentially the characteristic qualities of thought — gives rise to the synthetic principle of substantiality, so that if we posit contingency we posit substantiality as well. This principle which expresses an intellectual relation, and is a category, is certainly not employed here in an element which is heterogeneous, namely, in the world

of sense, but, on the contrary, in the intellectual world, which is its natural home. If it had no defect otherwise, it might, in fact, be applied with absolute justice in that sphere in which we are concerned with God, who can be conceived of only in thought and in Spirit, and this in opposition to its employment in the sensuous element, which is foreign to it.

The second fundamental fallacy to which Kant directs attention () is that contained in arguing from the impossibility of there being an infinite series of successive given causes in the world of sense, to the existence of a first cause. We are not justified in arguing thus on the principles which guide the use of reason even in experience itself, and still less can we extend this fundamental principle beyond experience. It is quite true we cannot within the world of sense and experience reason to the existence of a first cause, for in this world as a finite world there can be only conditioned causes. But just because of this, reason is not only justified in passing into the intelligible sphere, but is forced to do it; or rather, as a matter of fact, it is only in this sphere that reason is at home. It does not pass beyond the world of sense, but because it has this idea of a first cause it simply finds itself in another region, and we can look for a meaning in reason only in so far as it and its idea are thought of as being independent of the world of sense, and as having an independent standing in-and-for-themselves. The third charge brought by Kant against reason in connection with this proof is that it finds what is a false self-satisfaction, inasmuch as in the matter of the completion of the series of causes it finally casts aside a condition of any kind, while, as a matter of fact, there can be no necessity apart from a condition; and he objects, again, that the fact that we cannot conceive of anything further is held to be a completion of the conception. Now it is certain that if we are dealing with an unconditioned necessity, with an absolutely necessary Essence, we can reach it only in so far as it is conceived of as unconditioned, that is, in so far as the characteristic quality of having

conditions has been done away with. But, adds Kant, anything necessary cannot exist apart from conditions. A necessity of this sort which rests on conditions, that is, on conditions external to it, is a merely external, conditioned necessity; while an unconditioned absolute necessity is simply one which contains its conditions within itself, if we must speak of conditions in connection with it. The difficulty here is just the truly dialectic relation above referred to according to which the condition, or whatever other definition may be given of contingent existence or the finite, is something whose very nature it is to rise to the unconditioned, to the infinite, and thus in what is conditioned to do away with what conditions, and in the act of mediating to do away with the mediation. Kant, however, did not penetrate beyond the relations of the Understanding to the conception of this infinite negativity. Continuing this argument, he says (), we cannot avoid having the thought, and yet we cannot entertain it, that a Being whom we conceive of as the Highest should, as it were, say to Himself: I am from eternity to eternity, besides me there is nothing, unless what exists by my will; but whence then am I? Here everything sinks under us, and floats without support or foothold in the presence merely of speculative reason, while it costs the latter nothing to allow the greatest as well as the smallest perfection to go. But there is one thing which speculative reason must above all else “allow to go,” and that is the putting of such a question as, Whence am I? into the mouth of the absolutely necessary and unconditioned. As if that outside of which nothing exists unless through its will, that which is simply infinite, could look beyond itself for an other than itself, and ask about something beyond itself.

In bringing forward these objections, Kant, in short, gives vent to the view which he had, to begin with, in common with Jacobi, and which afterwards came to be the regular beaten track of argument, the view, namely, that where we do not have the fact of being conditioned along with

what conditions, it is impossible to form conceptions at all — in other words, that where the rational begins, reason ends.

The fourth error to which Kant draws attention is connected with the ostensible confusion between the logical possibility of the conception of all reality and the transcendental characteristics, which latter will be further dealt with when we come to consider Kant's criticism of the Ontological Proof.

To this criticism Kant adds () the "discovery" and "explanation" — made in his peculiar style — of the dialectic illusion which exists in all transcendental proofs of the existence of a necessary Essence, an explanation which contains nothing new; and then we have in Kant's usual fashion an incessant repetition of what is always one and the same assurance, namely, that we cannot think the Thing-in-itself.

He calls the Cosmological Proof, as he does the Ontological, a transcendental proof, because it is independent of empirical principles; that is to say, it is supposed to be established, not by reasoning from any particular quality of experience whatsoever, but from pure principles of reason, and even abandons that method of deduction according to which existence is given through empirical consciousness, in order to base itself on what are simply pure conceptions. What better method indeed could philosophical proof adopt than that of basing itself only on pure conceptions? Kant, on the contrary, in speaking thus, intends to say the very worst he possibly can of this proof. So far, however, as the dialectic illusion is concerned, the discovery of which is here made by Kant, we find it to consist in the fact that while I must indeed allow that existence in general has a necessary element in it, no single thing can, on the other hand, be thought of as necessary in itself, and that I can never complete the act of going back to the conditions of existence without assuming the existence of something necessary while I can at the same time never start from this.

It must in justice be allowed that this remark contains the essential moment on which the whole question turns. What is necessary in itself must show that it has its beginning in itself, and must be conceived of in such a way as to allow of its being proved that its beginning is in itself. This requirement is indeed the only interesting point, and we must assume that it lay at the bottom of what was previously referred to, namely, the trouble Kant took to prove that the Cosmological Proof rests on the Ontological. The sole question is as to how we can begin to show that anything starts from itself, or rather how we can combine the two ideas that the Infinite starts from an Other, and yet in doing this starts equally from itself.

As regards the so-called explanation and solution, so to speak, of this illusion, it will be seen to be of the same character as the solution which he has given of what he calls the antinomies of reason. If I must think (of a certain necessary element as belonging to existing things in general, and yet am not warranted in thinking that anything is necessary in itself, the unavoidable conclusion is that necessity and contingency cannot apply to, or have any connection with, the things themselves, because otherwise we would be landed in a contradiction. Here we have that tenderness towards things which will not permit any contradiction to be attached to them, although even the most superficial experience, equally with experience of the most thorough kind, everywhere shows that these things are full of contradictions. Kant then goes on to say that neither of these two fundamental principles, of contingency and necessity, is objective; but that they can in any case be only subjective principles of reason, implying, on the one hand, that we cannot stop short unless with an explanation completed in an a priori way, while, on the other hand, any such complete explanation is not to be looked for, that is, not in the empirical sphere. Thus the contradiction is preserved and is left wholly unsolved, while it is at the same time transferred from things to reason. If the circumstance that the

contradiction such as it is here held to be, and such as it actually is, is not directly solved, implies a defect, then the defect would as a matter of fact have to be transferred to the so-called things — which are partly merely empirical and finite, but are also partly that Thing-in-itself which is incapable of manifesting itself — rather than to reason, which, even as understood by Kant, is the faculty which deals with ideas, with the Unconditioned and the Infinite. But in truth reason can in any case bear the weight of the contradiction, and can certainly solve it too; and things, at all events, know how to bear it, or rather, we should say, they are only contradiction in the form of existence; and this is true of that Kantian schema of the Thing-in-itself quite as much as of empirical things, and only in so far as they are rational can they solve it directly within themselves.

In Kant's criticism of the Cosmological Proof those moments are at least discussed on which the point at issue really turns. We have noted two circumstances connected with this criticism: first, that the Cosmological Argument starts from Being as a presupposition, and from this goes on to the content, to the conception of God; and second, that Kant finds fault with the line of argument on the ground that it rests on the Ontological Proof, i.e., on the Proof in which the conception is presupposed, and in which we advance from this conception to Being. Since, according to the standpoint we at present occupy in conducting our investigation, the conception of God has no further determinate quality than that of the Infinite, it follows that what we are concerned with is, speaking generally, the Being of the Infinite. In accordance with the distinction previously referred to, in the one instance it is Being from which we start, and which has to get a determinate character as the Infinite; and in the other it is the Infinite from which we start, and which has to get a determinate character as having Being. Further, in the Cosmological Proof finite Being appears as a starting-point adopted empirically. The Proof essentially sets out from experience, as Kant says (),

in order to lay a really firm foundation for itself. The relation here implied ought more strictly, however, to be referred back to the form of the judgment in general. In every judgment the subject is an idea which has been presupposed, and which is defined in the predicate, that is, an idea which is defined or determined in a general way by thought, which means, again, that the determinations or specific qualities of the content of the subject have to be indicated, even if, as in the case of the material predicates, red, hard, and so on, this general mode of determination, which is, so to speak, the share thought has in the matter, is really nothing more than the empty form of universality. Thus, when it is said that God is infinite, eternal, and so on, God is, to begin with, as a subject simply something hypothetical, existing in idea, and it is only in the predicate that it is first asserted what He is. So far as the subject is concerned, we do not know what He is, that is, what content He has, or what is the determinate character of the content, as otherwise it would be superfluous to have the copula "is" and to attach the predicate to it. Then further, since the subject represents the hypothetical element which exists in idea, this presupposition can be taken as signifying what has Being, and as implying that the subject is, or, on the other hand, that it is at first only an idea, that instead of being posited by sense-intuition, or sense-perception, it is posited in the sphere of ideas by imagination, by conception, by reason, and that it, in fact, gets such content as it has in the sphere of general ideas.

If we express these two moments in accordance with this more definite form, we shall at once get a more definite idea of the demands which are made upon them. Those moments give rise to the two following propositions —

Being defined, to begin with, as finite, is infinite; and The Infinite is.

For, so far as the first proposition is concerned, it is evident that it is Being properly so called which is presupposed as a fixed subject, and that it

is what must in any view of it remain, that is, it is what must have the predicate of the Infinite attached to it. Being in so far as it is, to begin with, characterised as finite, and because the finite and the Infinite are simultaneously conceived of as subjects, represents what is common to both. The real point is not that a transition is made from Being to the Infinite as representing something different from Being, but, on the contrary, that we pass from the finite to the Infinite, and that in this transition Being remains unaltered. It is consequently shown here to be the permanent subject whose first characteristic, namely, finitude, is translated into infinitude. It is almost superfluous to remark that since Being is conceived of as subject and finitude as simply one characteristic, and, in fact, as the subsequent predicate shows, as a purely transitory characteristic, when we are dealing with the proposition taken by itself alone: Being is infinite, or is to be characterised as infinite, we must by the term Being understand Being as such, and not empirical Being, not the moral finite world.

This first proposition is accordingly the proposition of the Cosmological Argument, Being is the subject, and this presupposition whether it is taken as given or deduced, it does not matter how, is in reference to the act of proof as mediation through grounds or reasons in general, the immediate in general. This consciousness that the subject represents what is presupposed in general, is what is alone to be regarded as the important thing in connection with knowledge reached by demonstration. The predicate of the proposition is the content which must be proved to belong to the subject. Here it is the Infinite, which has consequently to be shown to be the predicate of Being and of its content, and as reached by means of mediation.

The second proposition: the Infinite is, has the more definitely determinate content as its subject, and here it is Being which has to show

itself to be what is mediated. It is this proposition which forms the real point of interest in the Ontological Proof, and has to appear as the result. So far as the demands of the kind of proof sought by the Understanding, and of the mere knowledge of the Understanding, are concerned, the proof of this second proposition as connected with the first proposition of the Cosmological Argument may be dispensed with; but it is certainly demanded by the requirements of reason in its higher form, though this higher requirement of reason appears in Kant's criticism disguised, so to speak, as a mere piece of chicanery, which has been deduced from some more remote consequence.

The fact, however, that these two propositions are necessary rests on the nature of the Notion, in so far as this latter is conceived of in accordance with its true nature, that is, in a speculative way. Here, however, it is presupposed that this knowledge of the Notion has been got from logic, just as it is presupposed in the same way that logic tells us that a true proof is rendered impossible by the very nature of such propositions as the two referred to. This may, however, be briefly indicated here as well, in accordance with the explanation which has been given regarding the peculiar nature of these judgments, and it is all the more fitting to make this plain at this point, since the current principle of so-called immediate knowledge recognises and takes into consideration just this very proof of the Understanding and no other, a proof which is inadmissible in philosophy. What has to be demonstrated is a proposition, a judgment, in fact, with a subject and predicate. We cannot, to begin with, find any fault with the demand here implied, and it looks as if the whole point turned on the nature of the act of proof. But the very fact that it is a judgment which has to be proved at once renders any true philosophical proof impossible. For it is the subject which is presupposed, and consequently becomes the standard for the predicate the truth of which has to be proved; and

accordingly the essential criterion so far as the proposition is concerned, is merely whether the predicate is adequate to the subject or not, and idea or ordinary thought, on which the presupposition is based, is taken as deciding the truth. But the main and only concern of knowledge, the claims of which have not been satisfied, and which have not even been taken into account, is just to find out whether this very presupposition contained in the subject, and consequently the further specification which it gets through the predicate, is the totality of the proposition and is true.

This is something which reason forces us to, working from within outward, unconsciously as it were. From what has been already adduced, it is evident that an attempt has been made to find what are called several proofs of the existence of God: the one set of which is based on one of the propositions above indicated, that, namely, in which Being is the subject and constitutes the presupposition, and in which the Infinite is a characteristic posited in it by means of mediation; and the other set of which has for its basis the reverse proposition, by means of which the first of the propositions loses its one-sidedness. Here the defective element, namely, the fact that Being is presupposed, is cancelled, and conversely it is now Being which has to be posited as mediated.

What has to be accomplished by the proof has accordingly been stated in a complete enough way, but still the nature of the proof itself as such has been in consequence not touched upon. For each of the propositions has been stated separately, the proof of it accordingly starts from the presupposition which the subject contains, and which has each time to be shown to be necessary through the other, and not as immediately necessary. Either proposition presupposes the other, and no true beginning can be found for them. For this very reason it appears at first to be a matter of indifference where a beginning is made. Only the starting-point is not a matter of indifference, and the whole point just is to find out why it is not.

The question is not as to whether or not we are to begin with one or other of the presuppositions, that is, with the immediate characteristic, the ordinary idea; but rather, what we have got to see is that no beginning can be made with any such presupposition, that is, that it cannot be regarded and treated as forming the basis, the permanent foundation of the proof.

For the statement that the presuppositions belonging to each of the two propositions — of which the one is proved by the other — have to be represented as mediated, when taken in its more obvious sense, deprives them of the essential meaning which belongs to them as immediate characteristics. For the fact that they are posited as mediated implies that their essential character consists in their being transitory rather than permanent subjects. In this way, however, the whole nature of the proof is altered, for it stood in need of having the subject as a fixed basis and standard. If it starts from something which has a transitory character, it loses all support, and cannot, in fact, have any existence at all. If we consider the form of the judgment more closely, it will be seen that what has just been explained is involved in the form itself, and, in fact, the judgment is what it is just owing to its form. It has, that is, for its subject something immediate, something which has Being in general, while as its predicate, which is meant to express what the subject is, it has something universal, namely, thought. The judgment consequently itself signifies that what has Being is not a something having Being, but is a thought.

This will at once become clearer from the example with which we are dealing, and which will better help us to understand, however, why we are limited to what the example directly contains, namely, the first of the two propositions, in which the Infinite is posited as what has been mediated. The express consideration of the other, in which Being appears as a result, will be taken up in a different place.

The major proposition of the Cosmological Proof in the more abstract form in which we took it, contains what is the essential element of the connection of the finite and the Infinite, the thought, namely, that the latter is got by way of hypothesis out of the former. The proposition, “If the finite exists, the Infinite exists also,” put in a more definite form is primarily the following: “The Being of the finite is not only its Being, but is also the Being of the Infinite.” We have thus reduced it to its simplest form, and have left out of account those developments which might be added to it by means of the still further specified forms of reflection which belong to the Infinite as having its Being conditioned by the finite, or to the Infinite as being presupposed through the finite, or to the relation of causality between finite and Infinite. All these relations are contained in that one simple form. If, in accordance with the definition previously given, we speak of Being in more definite terms as the subject of the judgment, the proposition will run thus: “Being is to be defined not as finite only but also as infinite.” The real point is the demonstration of this connection. This, as was shown above, springs from the conception of the finite, and this speculative way of dealing with the nature of the finite, with the mediation out of which the Infinite proceeds, is the pivot round which the whole question, namely, as to the knowledge of God and the philosophical understanding of Him, turns. The essential point, however, in this mediation is, that the Being of the finite is not the affirmative, but that, on the contrary, the Infinite is posited and mediated by the abrogation of this Being of the finite.

The essential and formal defect in the Cosmological Proof consists in the fact that finite Being is not only taken directly as the beginning and starting-point, but is regarded as something true, something affirmative, with an existence of its own. All those forms of reflection referred to, such as the presupposed, the conditioned, causality, have this in common, that what forms the presupposition, the condition, the effect, are taken as affirmative,

and the connection is not conceived of as a transition, which it essentially is. What the study of the finite from a speculative point of view really yields, is not merely the thought, that if the finite exists, the Infinite exists too, not that Being is to be defined as not merely finite, but that it is further to be defined as infinite. If the finite were this affirmative, the major proposition would be the proposition — finite Being as finite is infinite, for it would be its permanent finitude which the Infinite included in itself. Those characteristics such as presupposition, condition, causality, when taken together, give a still greater stability to the affirmative show or appearance of the Being of the finite, and are for this very reason only finite, that is, untrue relations, relations of what is untrue. To get to know that this is their nature is what alone constitutes the logical interest attaching to them, though their dialectic in accordance with their special characteristics takes in each case a special form, which is, however, based on the general dialectic of the finite already referred to. The proposition which ought to constitute the major proposition of the syllogism must accordingly take the following form rather: the Being of the finite is not its own Being, but is, on the contrary, the Being of its Other, namely, the Infinite. Or to put it otherwise, Being which is characterised as finite possesses this characteristic only in the sense that it cannot exist independently in relation to the Infinite, but is, on the contrary, ideal merely, a moment of the Infinite. Consequently the minor proposition: the finite is — disappears in any affirmative sense, and if we may still say it exists, we mean that its existence is merely an appearance or phenomenal existence. It is just the fact that the finite world is merely a manifestation or appearance which constitutes the absolute power of the Infinite.

The form taken by the syllogism of the Understanding has no place for the dialectic character which thus marks the finite, nor has it any way of expressing it. It is not in a position to express the rational element in it; and

since religious elevation is the rational element itself, it cannot find satisfaction in that form of the Understanding, for there is more in it than this form can express. It is accordingly in itself of the greatest importance that Kant should have deprived the so-called proofs of the existence of God of the regard they enjoyed, even though he had done no more than create a prejudice against them by showing their insufficiency. Only, his criticism of these proofs is insufficient in itself; and besides, he failed to recognise the deeper basis upon which these proofs rest, and so was unable to do justice to their true elements. It was he who at the same time began the complete maiming of reason, which has since his day been content to be nothing more than the source of purely immediate knowledge.

So far we have been dealing with the elucidation of the conception which constitutes the logical element in the first characteristic of religion, and have been regarding it, on the one hand, from the side from which it was viewed in metaphysics in its earlier phase; while, on the other hand, we have been looking at the outward form in which it was put. But this is not sufficient if we are to get a real knowledge of the speculative conception of this characteristic. Still, one part of this knowledge has already been indicated, that, namely, which has reference to the passing over of finite Being into infinite Being, and we have now to indicate briefly the other part, the detailed elucidation of which will be deferred till we come to deal with another form of religion to be taken up subsequently. This is just what appeared previously in the form taken by the proposition: the Infinite is, and in which consequently Being is defined in general as what is mediated. The proof has to demonstrate this mediation. It already follows from the foregoing remarks that the two propositions cannot be separated from each other. The very fact that the form of the syllogism belonging to the Understanding is abandoned so far as the one is concerned, implies that the separation of the two has been abandoned also. The moment which has still

to be dealt with is accordingly already contained in the given development of the dialectic of the finite.

If, however, in showing how the finite passes over into the Infinite, we have made it appear as if the finite were taken as the starting-point for the Infinite, so, too, the other proposition, which is merely the converse proposition or transition, seems to be necessarily defined as a passing over from the Infinite to the finite, or, in other words, has to take on the form of the proposition: "The Infinite is finite." In this equation the proposition: the Infinite is, would not contain the entire characteristic which has to be dealt with here. This difference disappears, however, when we consider that Being, since it is the Immediate, is directly differentiated from the characteristic of the Infinite, and is, as a direct consequence of this, characterised simply as finite. The logical nature which thus belongs to Being or immediacy in general is, however, presupposed as given by logic. This characteristic of the finitude of Being, however, comes directly into view in the connection in which Being here stands. For the Infinite, in resolving to become Being, determines itself to what is other than itself; but then the Other of the Infinite is just the finite.

If, further, as was previously indicated, the subject appears in the judgment as something presupposed, what has Being in fact, while the predicate is something universal, namely, thought, then in the proposition, "The Infinite is," a proposition which is at the same time a judgment, the determination seems rather to be reversed, since the predicate expressly involves Being, while the subject, the Infinite namely, exists in thought only, though certainly in objective thought. Still we might remember the common idea that Being itself is only a thought, chiefly in so far as it is regarded in this abstract and logical way, and all the more if the Infinite, too, is only a thought, for in this case its predicate also could not possibly be anything else but a subjective thought. In any case, the predicate

regarded from the point of view of its form in the judgment is the Universal and is thought, while considered according to its content or determinateness it is Being, and taken in a more definite sense it is immediate and also finite or particular Being. If, however, it is meant by this, that Being, because it has been thought, is therefore no longer Being as such, then this is simply an absurd idealism which maintains that if anything is thought it therefore ceases to be, or even that what is cannot be thought, and that therefore only nothing is thinkable. Still the idealism which enters into that aspect of the entire conception or notion to be considered here will be discussed later on when we enter on the explanation already indicated. The point, however, to which attention should really be directed is, that it is just the judgment indicated which, owing to the antithesis of its content and its form, contains in it that counter-stroke which expresses the nature of the absolute union in one of the two previously separated sides, and which is the nature of the Notion itself.

Put shortly, what we have so far learned regarding the Infinite is, that it is the affirmation of the self-annulling finite, the negation of the negation, what is mediated, but mediated by the annulling of the mediation. This already means that the Infinite is simple reference to self, that abstract equality with self which is called Being. Or, it is the self-annulling mediation, while the Immediate is just the mediation absorbed and annulled, in other words, that into which the self-annulling mediation passes, that which it becomes by annulling itself.

It is just in consequence of this that this affirmation, this thing which is equal to itself in one, is thus immediate and equal to itself only when it is simply the negation of the negation, that is, it itself contains the negation, the finite, but as an appearance or semblance which annuls itself and is preserved in something higher. Or, since the immediacy which it comes to be by this act — that abstract equality with itself into which it passes over

and which is Being — is only the moment of the Infinite conceived of in a one-sided way, and the affirmative as representing it appears only as this entire process, and is therefore finite, it follows that the Infinite, in determining itself in the form of Being, determines itself as finitude. But finitude and this immediate Being are consequently just the negation which negates itself. This apparent end, the passing of the living dialectic into the dead repose of the result, is itself only the beginning again of this living dialectic.

This is the Notion, the logical and rational element in the first abstract characteristic of God and religion. The side represented by the latter is expressed by that moment of the Notion which starts from immediate Being, and which is absorbed in and taken up into the Infinite. The objective side, however, as such is contained in the self-unfolding of the Infinite into Being and finitude, which, just because of this, is merely momentary and transitory — transitory merely, in virtue of the infinitude whose manifestation it merely is, and which represents the force in it. The so-called Cosmological Proof is of use solely in connection with the effort to bring into consciousness what the inner life, the pure rational element of the inner movement, really is, and which, regarded in its subjective aspect, is called religious elevation. If this movement, when it appears in that form of the Understanding in which we have seen it, is not conceived of and understood as it is in-and-for-itself, still the substantial element which forms its basis does not lose anything in consequence. It is this substantial element which penetrates the imperfection of the form and exercises its power; or rather, we might say, it is itself the real and substantial force. The religious elevation of the soul to God consequently recognises itself in that expression of the truth, imperfect as it is, and is aware of its inner and true meaning, and so protects itself against the syllogism of the Understanding and its methods which stunt this true meaning. That is why, as Kant says (in

the place already referred to,), “this method of proof undoubtedly most readily carries persuasion with it, not only for the ordinary understanding, but for the speculative understanding too; and it obviously contains, too, the main lines on which all the proofs of natural theology are based, and which have at all times been followed, and will be still further followed, however much people may try to trick them out and conceal them under all sorts of fancy embellishments;” and, I add, it is possible by following the Understanding entirely to miss the meaning of the substantial element contained in these great fundamental lines of argument, and to imagine they have been formally refuted by the critical understanding, or, it may be, in virtue of the want of understanding as well as the want of reason characteristic of so-called immediate knowledge, politely to throw these arguments on one side unrefuted or to ignore them.

ELEVENTH LECTURE

Having given this explanation regarding the general scope of the characteristics of the content with which we are dealing, we shall now consider the course followed by the act of elevation first mentioned, in that particular form in which it is at present before us. This course consists simply in reasoning from the contingency of the world to an absolutely necessary Essence belonging to it. If we look at this syllogism as expressed in a formal way and at its particular elements, we find that it runs thus: The contingent does not rest upon itself, but, speaking generally, rests upon the presupposition of something which is in itself absolutely necessary, and which we call its essence, ground, or cause. But the world is contingent, the single things in it are contingent, and it as representing the whole is the aggregate of these; therefore the world presupposes the existence of something absolutely necessary in itself.

The determination from which this conclusion starts is the contingency of material things. If we take these things according as we find them in sensation and in ordinary thought, and if we compare the various processes which go on in the human mind, then we have a right to assert it to be a fact of experience that material things taken by themselves are regarded as contingent. Individual things do not come out of themselves, and do not pass away of themselves; being contingent, they are destined to drop away, and this is not something which happens to them in an accidental way merely, but is what constitutes their nature. Even if the course they follow is one which develops within themselves and is guided by rule and law, still it goes on till it reaches what is their end, or rather, it does nothing but lead up to their end; and so, too, their existence is interfered with in all kinds of

ways by other things, and is brought to an end by external causes. If they are regarded as conditioned, then we can see that their conditions are things which exist independently outside of them, and which may correspond to them or not, and by which they are temporarily supported, or, it may be, are not. To begin with, they are seen to be co-ordinated in space without being ranged together in accordance with any other relation naturally belonging to them. The most heterogeneous elements are found side by side, and they can be separated without any kind of derangement being caused in the existence either of the one thing or the other. In the same way they succeed one another outwardly in time. They are, in fact, finite; and however independent they may seem, they are essentially devoid of independence, owing to the limits attaching to their finitude. They are; they are in a real sense, but their reality has the value of something which is merely a possibility; they are, and can therefore equally well either be or not be.

Their existence reveals the presence not only of connections between conditions, that is, the points of dependence owing to which they come to be characterised as contingent, but also the connections of cause and effect, the regular rules which govern the course they follow both inwardly and outwardly — laws, in fact. These elements of dependence, this conformity to law, raises them above the category of contingency into the region of necessity, and thus necessity is found within that sphere which we thought of as occupied by what was contingent. Contingency claims things in virtue of their isolation, and therefore they may either exist or not exist; but then, as governed by law, they are the opposite of what is contingent, they are not isolated, but are qualified, limited, related, in fact, to one another. They do not, however, fare any the better because of the presence of this antithesis in their nature. Their isolation gives them a semblance of independence; but the connection in which they stand with other things — with each other, that is — directly expresses the fact that these single things are not

independent, shows that they are conditioned and are affected by other things, and are, in fact, necessarily conditioned by other things, and not by themselves. These necessary elements, these laws, would themselves consequently constitute the independent element. Anything which exists essentially in connection with something else has its essential character and stability not in itself, but in this connection. It is the connection upon which these are dependent. But these connections, when defined as causes and effects, the condition and the fact of being conditioned, and so on, have themselves a limited character, and are themselves contingent in relation to each other in the sense that any one of them may equally well exist or not exist, and may just as easily be disturbed by circumstances — that is, be interfered with by things which are themselves contingent, and have their active working and value destroyed, as the separate things over which they have no advantage in the matter of contingency. Those connections, on the other hand, to which necessity must be attributed, those laws, are not in any sense what we call things, but are rather abstractions. If the connection of necessity thus manifests itself in the region of contingent things in laws, and chiefly in the relations of cause and effect, this necessity itself takes the form of something conditioned, or limited — appears, in fact, as an outward necessity. It is itself relegated to the class of categories applying to things, both in virtue of their isolation, that is, their externality, and conversely in virtue of their being conditioned, of their limitation and dependence. In the connection expressed by causes and effects we get not only the satisfaction which is wanting in the empty unrelated isolation of things, which are just for this reason called contingent; but the indefinite abstraction which attaches to the expression "things," the element of variableness in them, disappears in this relation of necessity in which things become causes, original facts, substances that are active and indeterminate. But in the connections which hold good in this sphere the causes are themselves finite;

beginning as causes, their Being is isolated, and therefore contingent; or it is not isolated, and in that case they are effects, and are consequently not independent, but posited through an Other. The various series of causes and effects are partly contingent relatively to each other, and are partly themselves continued into the so-called Infinite, and thus contain in their content nothing but those situations and forms of existence of which each is finite in itself; and what ought to give stability to the connection of the series, the Infinite namely, is not only something above and beyond this world, but is a mere negative, the very meaning of which is relative merely, and is conditioned by what is to be negated by it, and is consequently for this very reason not negated.

Spirit, however, raises itself above this crowd of things contingent, above the merely outward and relative necessity involved in them, above the Infinite, which is a mere negative, and reaches a necessity which does not any longer go beyond itself, but is in-and-for-itself, included within itself, and is determined as complete in itself, while all other determinations are posited by it and are dependent upon it.

These may be in the form of ideas of an accidental or of a more concentrated kind, the essential moments of thought belonging to the inner life of the human spirit, to the reason which does not fully attain in a methodical and formal way the consciousness of its inner process, and still less gets so far as to be able to investigate those thought-determinations through which it passes, or the connections they involve. We have now got to see, however, if thought, which in the process of reasoning proceeds in a formal and methodical way, rightly conceives of and expresses the course followed in the elevation of the soul to God, which, so far, we have assumed to be a fact, and which we have been accustomed to deal with only in connection with the few fundamental characteristics belonging to it. Conversely, again, we have to find out whether those thoughts and the

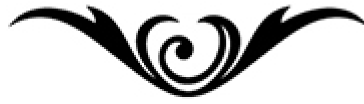
connection between them can be shown to be justified, and have their reality proved, by an examination of the thoughts in themselves, for it is only in this way that the elevation of the soul to God really ceases to be a supposition, and that the unstable element in any right conception of it disappears. We must, however, decline to enter upon this examination here, seeing that if it were demanded on its own account we should have to go on to the ultimate analysis of thought. It has to be carried out in a thorough way in logic, the science of thought; for I identify logic with metaphysic, since the latter, too, is really nothing but an attempt to deal with some concrete content, such as God, the world, the soul, but in such a way that these objects have to be conceived of as noumena, that is, we have to deal with the element of thought in them. At this point it will be preferable to take up the logical results merely, rather than the formal development. An investigation of the proofs of the existence of God cannot be undertaken independently at all, if it is required to have philosophical and scientific completeness. Science is the developed connection of the Idea in its totality. In so far as any individual object is lifted out of that totality, which must be the goal of the scientific development of the Idea, as representing the only method of exhibiting its truth, limits must be set to the investigation undertaken, and these it must presuppose to be definitely fixed, as is the case in other instances of scientific inquiry. Still the investigation may come to have an appearance of independence, owing to the fact that the unexplained presuppositions, which are what constitutes the limits of what is dealt with, and which analysis reaches in the course of its progress, are in themselves in harmony with consciousness. Every work contains such ultimate ideas, or fundamental principles, upon which either consciously or unconsciously the content is based. There is in it a circumscribed horizon of thoughts which are no further analysed, the horizon of which rests upon the culture it may be of a period, of a nation, or of some scientific circle, and

beyond which there is no need to go. In fact it would be prejudicial to what is called popular comprehension to attempt to extend this horizon beyond the limits of ordinary ideas by analysing these, and so to make it include speculative or philosophical conceptions.

Still, since the subject of these lectures belongs in itself essentially to the domain of philosophy, we cannot dispense with abstract conceptions. We have, however, already mentioned those which belong to this first standpoint, and we have only to range them together in a definite way in order to reach the speculative element; for, speaking generally, to deal with anything in a speculative or philosophical way simply means to bring into connection the thoughts which we already have.

The thoughts, therefore, which have been already indicated, consist, first of all, of the following main characteristics: a thing, a law, &c., is contingent in virtue of its isolation; the fact of its existence or non-existence does not bring about any derangement or alteration so far as other things are concerned. Then the fact that it is quite as little kept in existence by them, and that any stability it gets owing to them is wholly insufficient, gives them that very insufficient semblance of independence which is just what constitutes their contingency. The idea of necessity as applied to any existing thing, on the other hand, requires that it should stand in some connection with other things, so that regarded in any of its aspects it is seen to be completely determined by other existing things, in the form of conditions or causes, and cannot be separated from them or come into being of itself, nor can there be any condition, cause, or fact of connection by means of which it can be so separated, nor any such instance of connection as can contradict the other which qualifies the thing. In accordance with this description we place the contingency of a thing in its isolation, in the want of perfect connection with other things. This is the first point.

Conversely, again, since an existing thing thus stands in a relation of perfect connection, it is in all its aspects conditioned and dependent, is in fact perfectly wanting in independence. It is, on the other hand, in necessity alone that we find the independence of a thing. What is necessary must be. This fact that it must be, expresses its independence by suggesting that what is necessary is, because it is. This is the other point.



We thus see that the necessity of anything requires two sorts of opposed characteristics: on the one hand, its independence, in which, however, it is isolated, and which makes its existence or non-existence a matter of indifference; and, on the other, its being based upon and contained in a complete relation to everything else whereby it is surrounded, and by the connection involved in which, it is kept in existence; this means that it is not independent. The necessary element is a recognised fact quite as much as the contingent element. Regarded from the point of view of the first of these ideas, everything exists in an orderly connection. The contingent is separated from the necessary, and points beyond it to a necessary something, which, however, when we look at it more closely, is itself included in contingency, just because, being posited by another, it is dependent. When, however, it is taken out of any such connection it is isolated, and is consequently directly contingent. The distinctions drawn are accordingly merely imaginary.

Since it is not our intention to examine further the nature of these thoughts, and since we wish in the meantime to leave the antithesis of necessity and contingency out of account, we shall confine ourselves to what is suggested by the idea we have given of them, namely, that neither of the determinations is sufficient to express necessity, but that for this both are required — independence, so that the necessary may not be mediated by an Other; and also the mediation of this independence in connection with the Other. They thus contradict each other, but since they both belong to the

one necessity they must not contradict each other in the unity in which they are joined together in it. Our view of the matter renders it necessary that the thoughts which are united in this necessity should be brought into connection in our minds. In this unity the mediation with an Other will thus itself partake of independence, and this, as a reference to self, will have the mediation with an Other within itself. In this determination, however, both can be united only in such a way that the mediation with an Other is at the same time a mediation with self, that is, their union must imply that the mediation with an Other abolishes itself, and becomes a mediation with self. Thus the unity with self is not a unity which is abstract identity, such as we saw in the form of the isolation in which the thing is related only to itself, and in which its contingency lies. The one-sidedness, on account of which alone it is in contradiction with the equally one-sided mediation by an Other, is done away with, and these untruths have thus disappeared. The unity thus characterised is the true unity, and when truly known is the speculative or philosophical unity. Necessity as thus defined, since it unites in itself these opposite characteristics, is seen to be something more than a simple idea or a simple determinateness; and further, the disappearance of the opposite characteristics in something higher is not merely our act, or a matter with which we only have to do, in the sense that we only bring it about, but expresses the very nature and action of these characteristics themselves, since they are united in one characteristic. So, too, these two moments of necessity, namely, that its mediation with an Other is in itself, and that it does away with this mediation and posits itself by its own act because of this very unity, are not separate acts. In the mediation with an Other it relates itself to itself, that is, the Other through which it mediates itself with itself is itself. Thus as an Other it is negated; it is itself the Other, but only momentarily — momentarily without, however, introducing the quality of time into the notion, a quality which first appears when the notion

comes to have a definite existence. This Other-Being or otherness is essentially something which disappears in something higher, and it is in determinate existence also that it appears as a real Other. But the absolute necessity is the necessity which is adequate to its notion or conception.

TWELFTH LECTURE

IN THE PREVIOUS Lecture the notion or conception of absolute necessity was explained — of absolute necessity, I repeat. Very often absolute means nothing more than abstract, and very frequently, too, it is imagined that when the word absolute is used everything is said that is necessary, and that no further definition can or ought to be given. As a matter of fact it is just with this definition that we are chiefly concerned. Absolute necessity is abstract, the abstract pure and simple, inasmuch as it depends on itself and does not subsist in or from or through an Other. But we have seen that it is not only adequate to its notion or conception, whatever that notion be, so that we were able to compare this notion and its external existence; but that it represents this very adequacy itself. Thus what might be taken as the external aspect is contained in itself, so that this very fact that it depends on itself, this identity or reference to self which constitutes the isolation of things in virtue of which they are contingent, is a form of independence which again is really a want of independence. Possibility is an abstraction of the same kind. A thing is possible if it does not contradict itself, that is, it is what is merely identical with itself, something in which there is no kind of identity with an Other, while, on the other hand, it has not its Other within itself. Contingency and possibility differ only in this, that the contingent has in addition a definite existence. The possible has only the possibility of existence. But the contingent itself has an existence which has absolutely no value beyond being a possibility; it is, but quite as much it is not. In the case of contingency, the nature of determinate Being or existence belonging to it is, as has been already remarked, so far evident that it is seen at the same time to have the character of something which is virtually a

nullity, and consequently the transition to its Other, to the Necessary, is already expressed in that existence itself. It is an instance of the same thing as we have in abstract identity, which is a simple reference to self; it is known as a possibility, and being a possibility it is recognised that it is not yet anything. The fact that something is possible does not really imply anything. Identity is characterised as sterility, and that is what it really is.

What is wanting in this characteristic finds its complement, as we have seen, in the characteristic which is its antithesis. Necessity is not abstract, but truly absolute, solely in virtue of the fact that it contains the connection with an Other in itself, that it is self-differentiation, but a differentiation which has disappeared in something higher and is ideal. It consequently contains what belongs to necessity in general, but it is distinguished from this latter as being external and finite, and as involving a connection having reference to something else which remains Being and has the value of Being, and so is merely dependence. It goes by the name of necessity too, inasmuch as mediation is in general essential to necessity. The connection of its Other with something else, which is what constitutes it, does not get support from the ends for which it exists. Absolute necessity, on the other hand, transforms any such relation to an Other into a relation to itself, and consequently produces what is really inner harmony with itself.

Spirit rises above contingency and external necessity, just because these thoughts are in themselves insufficient and unsatisfying. It finds satisfaction in the thought of absolute necessity, because this latter represents something at peace with itself. Its result as result, however, is — it is so, it is simply necessary. Thus all aspiration, all effort, all longing after an Other, have passed away, for in it the Other has disappeared, there is no finitude in it, it is absolutely complete in itself, it is infinite and present in itself, there is nothing outside of it. It has in it no limit, for its nature is to be with itself, or at home with itself. It is not the act of rising to this necessity on the part of

Spirit which in itself produces satisfaction. The satisfaction has reference to the goal Spirit tries to reach, and the satisfaction is in proportion to its ability to reach this goal.

If we pause for a moment to consider this subjective satisfaction, we find that it reminds us of what the Greeks found in the idea of subjection to necessity. That Man should yield to inevitable destiny was the advice of the wise, and this was in particular the truth expressed by the tragic chorus, and we admire the repose of their heroes and the calmness with which they freely and undauntedly accept the lot which destiny has assigned to them. This necessity, and the aims of their own wills which are annihilated by it, the compulsory force of this destiny and freedom, appear as the opposing elements, and seem to leave no room for reconciliation nor for any kind of satisfaction. In fact the play of this antique necessity is shrouded in a sadness which is neither driven away by defiance nor disfigured by any feeling of bitterness, and all lamentation is rather suppressed by silence than stilled by the healing of the wounded heart. The element of satisfaction found by Spirit in the thought of necessity is to be sought for in this alone, that Spirit simply abides by that abstract result of necessity expressed in the words, "it is so," a result brought about by Spirit within itself. In this pure is there is no longer any content; all ends, all interests, all wishes, even the concrete feeling of life itself, have disappeared and vanished in it. Spirit produces this abstract result in itself just because it has given up this particular content of its will, the very substance of its life, and has renounced everything. It thus transforms into freedom the compulsion exercised upon it by fatality. For this force or compulsion can lay hold of it only by seizing on those sides of its nature which in its concrete existence have an inner and an outer determinate Being. As connected with external existence, Man is under the influence of external force in the shape of other men, of circumstances, and so on; but external existence has its roots in

what is inward, in his impulses, interests, and aims; they are the bonds, morally justifiable and morally ordained, or, it may be, not justifiable, which bring him into subjection to force. But the roots belong to his inner life, they are his; he can tear them out of his heart; his will, his freedom represent that power of abstraction from everything whereby the heart can make itself the grave of the heart. When the heart thus inwardly renounces itself, it leaves to force nothing upon which it can lay hold. What is crushed by force is a form of existence which is devoid of heart, an externality in which force can no longer affect Man: he is outside of the sphere in which force can strike.

It has been previously remarked that the result, it is so, is the result of the necessity, to which Man clings; and he abides by it as a result, that is, in the sense that it is he who produces this abstract Being. This is the other moment of necessity, mediation through the negation of otherness. This Other is the determinate in general, which we have seen in the form of inner existence, the giving up of concrete aims and interests; for they are not only the ties which bind Man to externality, and consequently bring him into subjection to it, but they themselves represent the particular element, and are external to what is most inward, the self-thinking pure universality, the pure relation of freedom to itself. It is the strength of this freedom that it can in this abstract way comprise within itself and put within itself that particular element which is outside of itself, and can thus make it into something external in which it can no longer be disturbed. The reason why we men are unhappy, or unsatisfied, or simply fretful, is because of the division within us, that is, because of the contradiction represented by the fact that these impulses, aims, and interests, or simply these demands, wishes, and reflections are in us, and that at the same time our existence has in it what is the Other, the antithesis of these. This disunion or unrest in us can be removed in a twofold manner. On the one hand, our outward

existence, our condition, the circumstances which affect us and in which our interests in general are involved, may be brought into harmony with the roots of their interests in ourselves, a harmony which is experienced in the form of happiness and satisfaction. On the other hand, in the event of there being a disunion between the two, and consequently in the event of unhappiness, instead of satisfaction there is a natural repose of the heart, or, where the injury goes deeper and affects an energetic will and its just claims, the heroic strength of the will produces at the same time a contentment by taking kindly to the actual state of things and by submitting to what actually is, and this is a yielding in which the mind does not in a one-sided way let go its hold on what is external, circumstances, or the actual condition of things, because they have been overcome and are overpowered, but which gives up by an act of its own will its inner determinateness and allows it to go. This freedom of abstraction is not without an element of pain; but the pain is brought down to the level of natural pain, and has not in it the pain of penitence, the pain attaching to the rebellious sense of wrong-doing, just as it has no consolation or hope. But then it is not in need of consolation, for consolation presupposes a claim which is still maintained and asserted and does not in one way really satisfy, while looked at in another way, it seeks a compensation, and in the act of hoping, a desire for something has been kept in reserve.

But it is just here that we find that moment of sadness already referred to, and which diffuses itself over this act, whereby necessity is transfigured and becomes freedom. The freedom here is the result of mediation through the negation of things finite. As abstract Being, the satisfaction gained is empty reference to self, the inner unsubstantial solitude of self-consciousness.

This defect lies in the determinate character of the result as well as of the starting-point. It is the same in both of these, that is to say, it is just the

indeterminateness of Being. The same defect which has been noted as present in the form taken by the process of necessity, as this process exists in the region of the volition of subjective Spirit, will be found, too, in the process when it is an objective content for the thinking consciousness. The defect, however, does not lie in the nature of the process itself; and we have now to consider that process in the theoretical form, which is the point we have specially to deal with.

THIRTEENTH LECTURE

THE GENERAL FORM of the process has been already referred to as consisting of a mediation with self which contains the moment of mediation in such a way that the Other is posited as something negated or ideal. This process has likewise been described, so far as its more definite moments are concerned, as it presents itself in the form of Man's elevation to God by the path of religion. We have now to compare the explanation given of the act whereby Spirit raises itself to God with that to be found in the formal expression which is called a proof.

The difference between them seems slight, but it is important, and supplies the reason why proof of this kind has been represented as inadequate and has generally been abandoned. Because what is material is contingent, therefore there exists an absolutely necessary Essence; this is the simple fashion in which the connection of ideas is put. Since mention is here made of an Essence, and since we have spoken only of absolute necessity, this necessity may certainly be hypostatised in this way; but the Essence is still indeterminate, and is not a subject or anything living, and still less is it Spirit. We shall, however, afterwards discuss the Essence as such in so far as it contains a determinate quality which has any interest in the present connection.

What is of primary importance is the relation indicated in the proposition: because the One, the contingent, exists, is, therefore the Other, the Absolutely-necessary, is, or exists. Here there are two forms of Being in connection, one form of Being connected with another form of

Being, a connection which we have seen in the shape of external necessity. It is, however, this very external necessity which is recognised to

be a form of dependence in which the result depends on the starting-point, but which, in fact, by sinking to a state of contingency, is recognised to be unsatisfying. It is against it, accordingly, that the protests have been directed which have been advanced against this method of proof.

It contains, that is to say, the relation according to which the one characteristic, that of absolutely necessary Being, is mediated by the Other, by means of the characteristic of contingent Being, whereby the former is put in a dependent relation, in the relation, in fact, of what is conditioned to its condition. This was the main objection which, speaking generally, Jacobi brought against the knowledge of God, namely, that to know or to comprehend means merely "to deduce anything from its more immediate causes, or to look at its immediate conditions as a series" (Letters on the Doctrine of Spinoza,); "to comprehend the Unconditioned therefore means to make it into something conditioned or to make it an effect." The latter category, however, according to which the Absolutely-necessary is taken as an effect, can be at once discounted, since the relation it implies is in too direct contradiction to the characteristic with which we are dealing, namely, the Absolutely-necessary. The relation of the condition, which is also that of the ground, is, however, of a more outward character, and can more easily find favour. In any case it is present in the proposition: because the contingent exists, therefore the Absolutely-necessary exists.

While it must be granted that this defect exists, it is, on the other hand, to be observed that no objective significance is given to a relation like this implying conditionateness and dependence. This relation is present only in an absolutely subjective sense. The proposition does not state, and is not meant to state, that the Absolutely-necessary has conditions, and is in fact conditioned by the contingent world — quite the contrary. The entire development of the connection is seen only in the act of proof. It is only our knowledge of the Absolutely-necessary which is conditioned by that

starting-point. The Absolutely-necessary does not exist in virtue of the fact that it raises itself out of the world of contingency, and requires this world as its starting-point and presupposition, in order that by starting from it it may thus first reach its Being. It cannot be the Absolutely-necessary, it cannot be God who has to be thought of thus as something mediated by an Other, as something dependent and conditioned. It is the content of the proof itself which corrects the defect which is visible only in its form. We are thus in presence of a distinction and a difference between the form and the nature of the content, and the form is more certainly seen to contain the defective element, from the very fact that the content is the Absolutely-necessary. This content is not itself devoid of form, as was evident from the nature of its determination. Its own form as being the form of the True is itself true, and the form which differs from it is for that reason the Untrue.

If we take what we have in general designated Form, in its more concrete signification, namely, as knowledge, we find ourselves amongst the well-known and favourite categories of finite knowledge, which as being subjective is defined generally as finite, while the course followed by the movement of knowledge belonging to it is defined as a finite act. Here accordingly the same element of inadequacy appears only in another shape. Knowledge is a finite act, and any such act cannot involve the comprehension of the Absolutely-necessary, of the Infinite. Knowledge demands, in short, that it should have the content in itself and should follow it. The knowledge which has an absolutely necessary, infinite content must itself be absolutely necessary and infinite. We thus find ourselves in the best position for wrestling once more with the antithesis whose affirmative and subsidiary help given by what was more of the nature of immediate knowledge, faith, feeling, and such like, we dealt with in the first Lectures. We must for the present leave the Form in this shape alone, but later on we shall have some reflections to make on the categories belonging to it. We

have in the meantime to deal with the Form in the more definite shape in which it appears in the proof which forms the subject of discussion.

If we call to mind the formal syllogism previously dealt with, it will be seen that one part of the first proposition, the major proposition that is, runs thus — If the contingent exists; and this is expressed in a more direct way in the other proposition — There is a contingent world. While in the former of these propositions the characteristic of contingency is posited essentially in its connection with the Absolutely-necessary, it is nevertheless stated to be at the same time something contingent which has Being. It is in the second proposition, or in this characteristic of the existent as it appears in the first, that the defect lies, and this in fact means that it is directly self-contradictory, and shows itself to be in its very nature an untrue one-sidedness. The contingent, the finite is expressed in terms of what has Being; but it is, on the contrary, characteristic of the finite that it should have an end and drop away, that it should be a kind of Being which has the value of what is merely a possibility and which may either be or not be.

This fundamental error is found in the form of the connection, which is that of an ordinary syllogism. A syllogism of this kind has a permanent immediate element in its premisses, it is based on presuppositions which are stated to be not only what is primary, but to be the permanent primary existent element with which the Other is in general so closely connected as some kind of consequence, something conditioned, and so on, that the two characteristics thus linked together constitute a relation which is external and finite, in which each of the two sides is in a relation of reference to the other. It constitutes one of the characteristics of these two sides, but it has at the same time a substantial existence of its own outside of the relation between them. The characteristic which the two different elements taken together constitute, and which is in itself simply one, is the Absolutely-necessary. Its name at once declares it to be the Only-one, what truly is, the

only reality. We have seen how its notion is the mediation which returns into itself, the mediation which is merely a mediation with itself by means of the Other which is distinguished from it, and which is taken up into the One, the Absolutely-necessary, negated as something having Being, and preserved merely as something ideal. Outside of this absolute, inherent unity, however, the two sides of the relation are in this kind of syllogism kept also externally apart from each other as things which have Being; the contingent is. This proposition is inherently self-contradictory, and is likewise in contradiction with the result, the absolute necessity, which is not merely placed on one side, but, on the contrary, is the whole of Being.

If therefore we begin with the contingent, we must not set out from it as if it were something which is to remain fixed in such a way that it continues to be in the further development of the argument something which has Being. This is its one-sided determinateness. On the contrary, it is to be posited with its completely determinate character, which implies that non-Being may quite as well be attributed to it, and that it consequently enters into the result as something which passes away. Not because the contingent is, but, on the contrary, because it is non-Being, merely phenomenal, because its Being is not true reality, the absolute necessity is. This latter is its Being and Truth.

This moment of the Negative is not found in the form taken by the syllogism of the Understanding, and this is why it is defective when it appears in this region which is that of the living reason of Spirit, in the region, that is, in which absolute necessity itself is considered as the true result, as something which does indeed mediate itself through an Other, but mediates itself with itself by absorbing this Other. Thus the course followed by that knowledge of necessity is different from the process which necessity is. Such a course is therefore not to be considered as simply necessary true movement, but rather as finite activity. It is not infinite knowledge, it has

not the infinite for its content and for the basis of its activity, for the infinite appears only as this mediation with self through the negation of the negative.

The defect which has been pointed out as existing in this form of the process of reasoning, means, as has been indicated, that the elevation of Spirit to God has not been correctly explained in that proof of the existence of God which it constitutes. If we compare the two we see that this act of elevation is undoubtedly also an act whereby Spirit goes beyond worldly existence, as well as beyond what is merely temporal, changeable, and transitory. The world-element, it is true, is declared to be actual existence, and we start from it; but since, as was remarked, it is defined as the temporal, the contingent, the changeable and transitory, its Being is not satisfying for truth, it is not the truly affirmative, it is defined as what annuls and negates itself. It does not persistently retain its characteristic, to be; on the contrary, a Being is attributed to it which has no more value than non-Being whose characteristic contains in itself its non-Being, its Other, and consequently its contradiction, its disintegration and dissolution. But even if it seem to be the case, or may even actually be the case, that so far as faith is concerned this contingent Being as something present to consciousness remains standing on one side confronting the other side, the Eternal, the Necessary in-and-for-itself, in the form of a world above which is heaven, still the real point is not the fact that a double world has been actually conceived of, but the value which is to be attached to such a conception. This value is expressed when it is said that the one world is the world of appearance or illusion, and the other the world of truth. When the former is abandoned, and we pass over to the other only in the sense that the world of appearance still remains present here, the connection between them as it presents itself to the religious man does not mean that that world is anything more than merely the point of departure, or that it is

permanently fixed as a ground or basis to which Being, or the power of acting as a basis or condition, could be attributed. Satisfaction, everything in the way of a foundation or first principle is, on the contrary, found to exist in the eternal world as something which is independent in-and-for-itself. As opposed to this, in the form taken by the syllogism, the Being of both is expressed in a similar way — both in the one proposition of the connection: If a contingent world exists, an Absolutely-necessary exists too; as also in the other in which it is stated as a presupposition that a contingent world does exist; and further, in the third and concluding proposition: Therefore an Absolutely-necessary exists.

A few remarks may be further added regarding these propositions thus definitely expressed. And first of all in connection with the last of them, the way in which the two contrasted characteristics are linked together, must at once strike us: Therefore the Absolutely-necessary exists. Therefore expresses mediation through an Other, and yet it is immediacy, and directly absorbs the former of these characteristics, which, as has been indicated, is just what supplies the reason why such knowledge regarding whatever is its object is declared to be inadmissible. The abolition of mediation through an Other exists, however, potentially only. The syllogism, on the other hand, as exhibited in detail, gives full expression to this. Truth is a force of such a character that it is present even in what is false, and it only requires correct observation and attention in order to discover the True in the False itself, or rather actually to see it there. The True is here mediation with self by the negation of the Other and of the mediation through the Other. The negation, both of mediation through an Other, as well as of the abstract immediacy which is devoid of mediation, is present in the "therefore" above referred to.

Further, if the one proposition is: The contingent is, and the other: The necessary in-and-for-itself is, this essentially suggests that the Being of the contingent has an absolutely different value from necessary Being in-and-

for-itself. Still Being is what is common to both, and it is the one characteristic in both propositions. In accordance with this the transition does not take the form of a passing from one form of Being to another, but from one characteristic of thought to another. Being purifies itself from the predicate of contingency, which is inadequate to express its nature. Being is simple self-identity or equality with self. Contingency, on the other hand, is Being which is absolutely unlike itself, which contradicts itself, and it is only in the Absolutely-necessary that it is once more restored to this condition of self-identity. It is accordingly here that the course thus followed by the act of elevation to God, or this aspect of the act of proof, differs more definitely from the others referred to, in this, namely, that in the former of the two methods of procedure the characteristic which has to be proved, or is supposed to result from the proof, is not Being. Being is rather what the two aspects have permanently in common and which is continued from the one into the other. In the other method of procedure, on the contrary, the transition has to be made from the notion or conception of God to His Being. This transition seems more difficult than that from a determinateness of content in general, what we are accustomed to call a notion or conception, to another conception, and to what is more homogeneous, therefore, than the transition from the notion to Being is apt to appear.

The idea which lies at the basis of this is that Being is not itself a conception or thought. The proper place to consider it, in this antithesis in which it is exhibited as independent and isolated, will be when we come to deal with the proof referred to. Here, however, we have not, to begin with, to take it abstractly and independently. The fact that it is the element common to the two characteristics, the contingent and the Absolutely-necessary, suggests a comparison and an external separation between it and them, while at first it is in inseparable union with each, with contingent

Being and absolutely necessary Being. In this way we shall once more take up the form of the proof already referred to, and bring out still more definitely the difference in the contradiction which it undergoes, regarded from the two opposite sides, the philosophical side, and that of the abstract understanding.

The proposition indicated expresses the following connection —

Because contingent Being exists, therefore absolutely necessary Being exists.

If we take this connection in its simple sense without characterising it more definitely by means of the category of a ground, or reason, or the like, its meaning is merely this —

Contingent Being is *at the same time* the Being of an Other, that of the absolutely necessary Being.

This phrase "at the same time" seems to imply a contradiction, over against which the two contrasted propositions are placed as solutions, of which the one is —

The Being of the contingent is not its own Being, but merely the Being of an Other, and in a definite sense it is the Being of its own Other, the Absolutely-necessary. And the other —

The Being of the contingent is merely its own Being, and is not the Being of an Other, of the Absolutely-necessary.

It has been shown that the first of these propositions has the true meaning, which was also the meaning expressed by the idea contained in the transition. We shall take up further on the speculative or philosophical connection which is itself immanent in those determinations of thought which constitute contingency.

The other proposition, however, is the proposition of the Understanding in which thinkers of modern times have so firmly intrenched themselves. What can be more reasonable than to hold that anything, any form of

existence, and so, too, the contingent, since it is, is its own Being, is in fact just the definite Being which it is, and not rather an other kind of Being! The contingent is in this way retained on its own account separately from the Absolutely-necessary.

It is still easier to employ the characteristics finite and Infinite in order to express these two characteristics above mentioned, and thus to take the finite for itself, as isolated from its other, the Infinite. There is therefore, it is said, no bridge, no passage from finite Being to infinite Being. The finite is related only to itself, and not to its Other. The distinction which was made between knowledge as form and knowledge as content, is an empty one. This very difference between the two was rightly made the basis of syllogisms, syllogisms which start with the hypothesis that knowledge is finite, and for this reason conclude that this knowledge cannot know the Infinite because it has not the power of comprehending it. Conversely it is concluded that if knowledge did comprehend the Infinite it would necessarily be infinite itself; but it is admittedly not infinite, therefore it has not the power of knowing the Infinite. Its action is defined just as its content is. Finite knowledge and infinite knowledge yield the same kind of relation as is yielded by the finite and the Infinite in general. The only difference is that infinite knowledge is in a relation of stronger repulsion towards its opposite than the naked Infinite, and points more directly to the separation of the two sides of the antithesis, so that one only remains, namely, finite knowledge. In this way all relation based on mediation disappears, every kind of relation, that is, in which the finite and the Infinite as such, and so, too, the contingent and the Absolutely-necessary, might have stood to each other. The form of finite and Infinite is the one which has come to be most in vogue in connection with this way of looking at the question. That form is more abstract, and accordingly seems more comprehensive, than the first-mentioned.

The finite in general and finite knowledge have thus necessity directly ascribed to them over and above contingency. This necessity takes the form of continuous advance in the series of causes and effects, conditions and things conditioned, and was formerly described as external necessity, and was included in the finite as forming a part of it. It can be understood, indeed, only in reference to knowledge, but when included in the finite it is put in contrast with the Infinite without risk of the misapprehension which might arise through the employment of the category of the Absolutely-necessary.

If, accordingly, we keep to this expression, then the relation of finitude and infinitude at which we stop short will be that of their absence of relation, their absence of reference. We have reached the position that the finite as a whole and finite knowledge are incapable of grasping the Infinite in general, as well as the Infinite in the form it takes as absolute necessity, and also of comprehending the Infinite by the aid of the conceptions of contingency and finitude from which finite knowledge starts. Finite knowledge is accordingly finite just because it is based on finite conceptions; and the finite, including also finite knowledge, stands in relation to itself only, does not go beyond itself, because it is its own Being, and not in any sense the Being of an Other, and, least of all, the Being of its own Other. This is the proposition upon which so much reliance is placed. It supplies no way of passing from the finite to the Infinite, nor from the contingent to the Absolutely-necessary, nor from effects to an absolutely first non-finite cause. A gulf is simply fixed between them.

FOURTEENTH LECTURE

THIS DOGMATIC VIEW of the absolute separation between the finite and the Infinite has to do with Logic. It involves an opinion regarding the nature of the conceptions of the finite and the Infinite which is treated of in Logic. Here we shall confine ourselves chiefly to those characteristics which we have partly dealt with in the preceding Lectures, but which are also found in our own consciousness. The characteristics which belong to the nature of the conceptions themselves, and which have been exhibited in the Logic in their own pure determinateness and in that of their connection, must show themselves and be present in our ordinary consciousness as well.

When, therefore, it is said that the Being of the finite is only its own Being, and is in no sense the Being of an Other, it is thereby declared that there is no possible way of passing from the finite to the Infinite, and therefore no mediation between them, neither in themselves nor in and for knowledge, so that, although the finite is mediated through the Infinite, still the converse is not true, which is just the real point of interest. Appeal is thus already made to the fact that the Spirit of Man rises out of the contingent, the temporal, the finite, to God as representing the Absolutely-necessary, the Eternal, the Infinite, to the fact that the so-called gulf does not exist for Spirit, and that it really accomplishes the transition, and that the heart of Man, spite of the Understanding which asserts the existence of this absolute separation, will not admit that there is any such gulf, but, on the contrary, actually makes the transition from the finite to the Infinite in the act of rising to God.

The ready reply to this, however, is that if you grant the fact of this rising to God, there is certainly an act of transition on the part of Spirit, but not of

Spirit in itself, not a transition in the conceptions, or indeed in any sense of the conceptions themselves; and the reason of this just is that in the conception as here understood, the Being of the finite is its own Being and not the Being of an Other. When we thus regard finite Being as standing in relation to itself only, it is merely for itself, and is not Being for an Other. It is consequently taken out of the region of change, is unchangeable and absolute. This is how the matter stands with these so-called conceptions. Those, however, who assert the impossibility of any such transition will not admit that the finite is absolute, unchangeable, imperishable, and eternal. If the error involved in taking the finite as absolute were merely an error of the Schools, an illogical result the blame of which is to be put on the Understanding; if it were to be regarded, in fact, as belonging to those abstractions of an extreme kind with which we have got to do here, then we might very well ask if an error of this sort really mattered much since we might certainly regard these abstractions as of no account compared with the fulness of spiritual life found in religion, which, moreover, constitutes the great and really living interest of Spirit. But that it is exclusively the finite which constitutes the true interest amongst these so-called great and living interests, is only too evident from the attention paid to religion itself, in connection with which, and as a consequence of the fundamental principle referred to an amount of study has been bestowed on the history of the finite materials of the subject, on the history of external events and opinions far beyond that given to the infinite element, which has been confessedly reduced to a minimum. It is by the employment of thoughts and of these abstract categories of finite and Infinite that the renunciation of the knowledge of truth is supposed to be justified, and as a matter of fact it is in the region of pure thought that all these interests of Spirit have free play, in order that they may there have their real nature decided, for thoughts constitute the really inner substantiality of the concrete reality of Spirit.

But suppose we leave this conception of the Understanding, and its assertion that the Being of the finite is only its own Being, and not the Being of an Other, not transition itself, and take up the further idea which emphasises the element of knowledge. If it is agreed that Spirit does actually make this transition, then the fact of this transition is not a fact of knowledge, but of Spirit in general, and in a definite sense of faith. It has been sufficiently proved that this act of elevation to God, whether seen in feeling or in faith, or however you choose to define the mode of its spiritual existence, takes place in the inmost part of Spirit, in the region of thought. Religion as representing what concerns the innermost part of Man's nature has its centre and the root of its movement in thought. God in His Essence is thought, the act of thought itself, just as the ordinary representation of Him and the shape given to Him in the mind, as well as the form and mode in which religion appears, are defined as feeling, intuition, faith, and so on. Knowledge, however, does nothing beyond bringing this inward element into consciousness on its own account, beyond forming a conception of that pulsation of thought in terms of thought. In this, knowledge may appear one-sided, and it may appear all the more as if feeling, intuition, and faith essentially belonged to religion, and were more closely connected with God than His thinking notion and His notion as expressed in thought; but this inner element is present here, and thought just consists in getting a knowledge of it, and rational knowledge in general just means that we know a thing in its essential determinateness.

To have rational knowledge or cognition, to comprehend or grasp in thought, are terms which, like "immediate" and "faith," belong to present-day culture. They have the authority of a preconceived idea which has a twofold character. On the one hand, there is the fact that they are absolutely familiar, and are consequently final categories regarding whose signification and verification there is no need to inquire further. On the

other hand, there is the fact that the inability of reason to comprehend and know the True and the Infinite is something settled quite as much as their general meaning is. The words, to know or cognise, to comprehend or grasp in thought, have the value of a magical formula. It never occurs to those under the influence of this preconceived idea to ask what the expressions to know, to grasp in thought, mean, or to get a clear idea of them, and yet that would be the sole and only point of importance if we were to say something that was really pertinent regarding the main question. In any such investigation it would be evident of itself that knowledge merely expresses the fact of the transition which Spirit itself makes, and in so far as knowledge is true knowledge or comprehension it is a consciousness of the necessity which is contained in the transition itself, and is nothing save the act of forming a conception of this characteristic which is immanent and present in it.

But if, so far as the fact of the transition from the finite to the Infinite is concerned, it is replied that this transition takes place in the spirit, or in faith, feeling, and the like, such an answer would not be the whole answer, which rather essentially takes the following form. Religious belief, or feeling, inner revelation, means that we have an immediate knowledge of God which is not reached by mediation. It means that the transition does not consist of an essential connection between the two sides, but is made in the form of a leap from one to the other. What we would call a transition is broken up in this way into two separate acts which are outwardly opposed, and follow each other in succession of time only, and are related to each other by being compared or recalled. The finite and the Infinite simply keep in this condition of separation, and this being presupposed, Spirit occupies itself with the finite in a particular way; and in occupying itself with the Infinite in the way of feeling, faith, knowledge, it performs a separate, immediate and simple action — not an act of transition. Just as the finite

and the Infinite are without relation to each other, so, too, the acts of Spirit by which it fills itself with these characteristics, and fills itself either with the one or the other, have no relation to each other. Even if they happen to exist contemporaneously, so that the finite is found in consciousness along with the Infinite, they are merely mixed together. They are two independent forms of activity which do not enter into any relation of mediation with each other.

The repetition which is involved in this conception of the ordinary division of the finite and the Infinite has already been referred to — that separation by which the finite is put on one side in an independent form, and the Infinite on the other in contrast with it, while the former is not the less asserted in this way to be absolute. This is the dualism which, put in a more definite form, is Manicheism. But even those who maintain the existence of such a relation will not admit that the finite is absolute, and yet they cannot escape the conclusion which does not merely flow from the statement referred to, but is just this very statement itself, that the finite has no connection with the Infinite, that there is no possible way of passing from the one to the other, but that the one is absolutely distinct from the other. But even if a relation is conceived of as actually existing, it is, owing to the admitted incompatibility between them, a relation of a merely negative kind. The Infinite is thought of as the True and the only Affirmative, that is, the abstract Affirmative, so that its relation to the finite is that of a force in which the finite is annihilated. The finite, in order to be, must keep out of the way of the Infinite, must flee from it. If it comes into contact with it, it can only perish. As regards the subjective existence of these characteristics with which we are dealing, as represented, namely, by finite and infinite knowledge, we find that the one side, that of infinitude, is the immediate knowledge of Man by God. The entire other side, again, is Man in general; it is he who is the finite about which we are chiefly

concerned, and it is just this knowledge of God on his part, whether it is called immediate or not, which is his Being, his finite knowledge, and the transition from it to the Infinite. If, accordingly, the manner in which Spirit deals with the finite, and that in which it deals with the Infinite, are supposed to represent two different forms of activity, then the latter form of activity as representing the elevation of Spirit to God would not be the immanent transition referred to; and when Spirit occupied itself with the finite it would in turn do this in an absolute way, and be entirely confined to the finite as such. This point would allow of being dealt with at great length, but it may be sufficient here to remember that, although the finite is the object and the end dealt with by this side, it can occupy itself with it in a true way, whether in the form of cognition, knowledge, opinion, or in a practical and moral fashion, only in so far as the finite is not taken for itself, but is known, recognised, and its existence affirmed in connection with the relation in which it stands to the Infinite, to the Infinite in it, in so far, in fact, as it is an object and an end in connection with this latter category. It is well enough known what place is given to the religious element both in the case of individuals and even in religions themselves, and how this religious element in the form of devotion, contrition of heart and spirit, and the giving of offerings, comes to be regarded as a matter apart with which we can occupy ourselves and then have done with; while the secular life, the sphere of finitude, exists alongside of it, and gives itself up to the pursuit of its own ends, and is left to its own interests without any influence being exercised upon it by the Infinite, the Eternal, and the True — that is, without there being any passing over into the Infinite within the sphere of the finite, without the finite coming to truth and morality by the mediation of the Infinite, and so, too, without the Infinite being brought into the region of present reality through the mediation of the finite. We do not require here to enter upon the consideration of the lame conclusion that the one who has

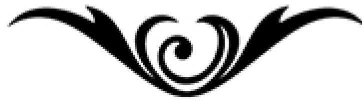
knowledge, namely, Man, must be absolute in order to comprehend the Absolute, because the same thing applies to faith or immediate knowledge as being also an inner act of comprehension, if not of the absolute Spirit of God, at all events of the Infinite. If this knowledge is so afraid of the concrete element in its object, then this object must at least have some meaning for it. It is really the non-concrete which has few characteristics or none at all, that is the abstract, the negative, what is least of all, the Infinite in short.

But then it is just by means of this miserable abstraction of the Infinite that ordinary thought repels the attempt to comprehend the Infinite, and for the simple reason that the present and actual Man, the human spirit, human reason, is definitely opposed to the Infinite in the form of a fixed abstraction of the finite. Ordinary thought would more readily allow that the human spirit, thought, or reason, can comprehend the Absolutely-necessary, for this latter is thus directly declared and stated to be the negative as opposed to its Other, namely, the contingent, which has on its part a necessity too, external necessity that is. What accordingly can be clearer than that Man, who moreover is, that is to say, is something positive or affirmative, cannot comprehend his negative? And conversely, is it not still more clear that since his Being, his affirmation, is finitude, and therefore negation. it cannot comprehend infinitude, which, as opposed to finitude, is equally negation but in the reverse way, since it is Being, affirmation in contrast with the characteristic attached to finitude? What then can be clearer than that finitude comes to Man from both sides? He can comprehend a few feet of space, yet outside of this volume there lies the infinitude of space. He possesses a span of infinite time, which in the same way shrinks up into a moment as compared with this infinite time, just as his volume of space shrinks up into a point. But considered apart from this outward finitude which characterises him in contrast with those infinite externalities, he is

intelligence, is able to perceive, to form ideas, to know, to have cognition of things. The object on which he exercises his intelligence is the world, this aggregate of infinite particular things. How small is the number of these known by individual men — it is not Man who knows but the individual — as compared with the infinite mass which actually exists. In order clearly to realise the paltry nature of human knowledge, we have only to remember a fact which cannot be denied, and which we are accustomed to describe as divine Omniscience, and to put it in the fashion in which it is expressed by the organist in L , in a funeral sermon reported in "The Courses of Life on Ascending Lines" (Part II., Supplement B.) — to mention once more a work marked by humour of the highest kind: "Neighbour Brise was speaking to me yesterday about the greatness of the good God, and the idea came into my head that the good God knew how to name every sparrow, every goldfinch, every wren, every mite, every midge, just as you call the people in the village, Schmied's Gregory, Briefen's Peter, Heifried's Hans. Just think how the good God can call to every one of these midges which are so like each other that you would swear they were all sisters and brothers — just think of it!" But as compared with practical finitude the theoretical element at least appears great and wide; and yet how thoroughly we realise what human limitation is, when these aims, and plans, and wishes, and all that so long as it is in the mind has no limits, are brought into contact with the reality for which they are intended. All that wide extent of practical imagination, all that endeavour, that aspiration, reveals its narrowness by the very fact that it is only endeavour, only aspiration. It is this finitude with which the attempt to form a conception of the Infinite, to comprehend it, is confronted. The critical Understanding which holds by this principle, supposed to be so convincing, has really not got beyond the stage of culture occupied by that organist in L , has in fact not even attained to it. The organist used the pictorial idea referred to in the

simplicity of his heart, in order to bring the idea of the greatness of God's love before a peasant community. The critical Understanding, on the other hand, employs finite things in order to bring objection against God's love and God's greatness, that is to say, against God's presence in the human spirit. This Understanding keeps firmly in its mind the midge of finitude, that proposition already considered — the finite is, a proposition the falseness of which is directly evident, for the finite is something the essential character and nature of which consist just in this that it passes away, that it is not, so that it is impossible to think of the finite or form an idea of it apart from the determination of Not-Being, which is involved in the thought of what is transient. Who has got the length of saying, the finite passes away? If the idea of Now is inserted between the finite and its passing away, and if in this way a kind of permanence is supposed to be given to Being— "the finite passes away, but it is now" — then this Now itself is something which not only passes away, but has itself actually passed away, since it is. The very fact that I have this consciousness of the Now, and have put it into words, shows that it is no longer Now, but something different. It lasts, it is true, but not as this particular Now, and Now can only mean this actual Now, in this particular moment, something without length, a mere point. It continues, in fact, only as being the negation of this particular Now, as the negation of the finite, and consequently as the Infinite, the Universal. The Universal is already infinite. That respect for the Infinite which keeps the Understanding from finding the Infinite in every Universal ought to be called a silly respect. The Infinite is lofty and majestic, but to place its grandeur and majesty in that countless swarm of midges, and to find the infinitude of knowledge in the knowledge of those countless midges, that is, of the individual midges, is a proof of the impotence, not of faith, of Spirit, or of reason, but of the Understanding to

conceive of the finite as a nullity, and of its Being as something which has equally the value and signification which belong to Not-Being.



Spirit is immortal; it is eternal; and it is immortal and eternal in virtue of the fact that it is infinite, that it has no such spatial finitude as we associate with the body when we speak of it being five feet in height, two feet in breadth and thickness, that it is not the Now of time, that the content of its knowledge does not consist of these countless midges, that its volition and freedom have not to do with the infinite mass of existing obstacles, nor of the aims and activities which such resisting obstacles and hindrances have to encounter. The infinitude of Spirit is its inwardness, in an abstract sense its pure inwardness, and this is its thought, and this abstract thought is a real, present infinitude, while its concrete inwardness consists in the fact that this thought is Spirit.

Thus, after starting with the absolute separation of the two sides, we have come back to their connection, and it makes no difference whether this connection is represented as existing in the subjective or objective sphere. The only question is as to whether it has been correctly conceived of. In so far as it is represented as merely subjective, as a proof only for us, it is of course granted that it is not objective and has not been correctly conceived of in-and-for-itself. But, then, what is incorrect in it is not to be looked for in the fact that there is no such connection at all, that is to say, that there is no such thing as the elevation of Spirit to God.

The real point, therefore, would be the consideration of this connection in its determinateness. The consideration of it in this way is a matter at once of the deepest and most elevated kind, and just because of this it is the most difficult of tasks. You cannot carry it on by means of finite categories; that is, the modes of thought which we employ in ordinary life and in dealing with contingent things, as well as those we are accustomed to in the sciences, don't suffice for it. The latter have their foundation, their logic, in

connections which belong to what is finite, such as cause and effect; their laws, their descriptive terms, their modes of arguing, are purely relations belonging to what is conditioned, and which lose their significance in the heights where the Infinite is. They must indeed be employed, but at the same time they have always to be referred back to their proper sphere and have their meaning rectified. The fact of the fellowship of God and Man with each other involves a fellowship of Spirit with Spirit. It involves the most important questions. It is a fellowship, and this very circumstance involves the difficulty of at once maintaining the fact of difference and of defining it in such a way as to preserve the fact of fellowship. That Man knows God implies, in accordance with the essential idea of communion or fellowship, that there is a community of knowledge; that is to say, Man knows God only in so far as God Himself knows Himself in Man. This knowledge is God's self-consciousness, but it is at the same time a knowledge of God on the part of Man, and this knowledge of God by Man is a knowledge of Man by God. The Spirit of Man, whereby he knows God, is simply the Spirit of God Himself. It is at this stage that the questions regarding the freedom of Man, the union of his individual consciousness and knowledge with the knowledge which brings him into fellowship with God, and the knowledge of God in him, come to be discussed. This wealth of relationship which exists between the human spirit and God is not, however, our subject. We have to take up this relationship only in its most abstract aspect, that is to say, in the form of the connection of the finite with the Infinite. However strong the contrast between the poverty of this connection and the wealth of the content referred to may seem, still the logical relation is at the same time also the basis of the movement of that fulness of content.

FIFTEENTH LECTURE

THE CONNECTION BETWEEN these forms of thought referred to which constitutes the entire content of the Proof under discussion, has already been examined in the foregoing Lectures. That this connection does not correspond to the results supposed to be reached in the Proof, is a point to be thoroughly discussed afterwards. The peculiarly speculative aspect of the connection, however, still remains to be considered, and we have here to indicate, without entering upon this logical examination in detail, what characteristic of this connection has reference to this speculative aspect. The moment to which attention has mainly to be directed in reference to this connection, is the fact that it is a transition, that is to say, the point of departure has here the characteristic quality of something negative, has the character of contingent Being, of what is a phenomenon or an appearance only, which has its truth in the Absolutely-necessary, in the truly affirmative element in this latter. As regards, first of all, the former of these characteristics, the negative moment namely, if we are to get a philosophical grasp of it, all that is necessary is that it be not taken as representing mere Nothing. It does not exist in any such abstract form, but, on the contrary, is merely a moment in the contingency of the world. There ought accordingly to be no difficulty in not taking the negative as abstract Nothing. The popular idea of contingency, limitation, finitude, phenomenon, involves the idea of definite Being, of definite existence, but at the same time it substantially involves negation. Ordinary thought is more concrete and true than the Understanding which abstracts, and which when it hears of a negative too easily makes Nothing out of it, pure Nothing, Nothing as such, and gives up all thought of its being in any way

connected with existence in so far as existence is defined as contingent, phenomenal, and so on. Reflective analysis points to the two moments which exist in a content of this kind — namely, an affirmative, definite Being, existence as one particular form of Being; but a moment also which involves the quality of finality, mortality, limits, and so on, in the form of negation. Thought, if it is to form a conception of the contingent, cannot allow these moments to be separated into a Nothing for itself and a Being for itself. For they do not exist in this form in the contingent; on the contrary, it comprises both in itself. They are therefore not to be taken as existing each by itself in connection with one another, nor is the contingent to be taken just as it is, as representing the connection between them. This then is the speculative determination. It remains true to the content of ordinary thought or conception, while, on the contrary, this content escapes abstract thought which asserts the independence of the two moments. It has resolved into its parts the contingent, which is the object of the Understanding.

The contingent accordingly, as thus defined, represents what is a contradiction in itself. What thus resolves itself becomes in consequence just exactly what it became in the hands of the Understanding. But resolution is of two sorts. The resolution effected by the Understanding results simply in the disappearance of the object, of the concrete union; while in the other kind of resolution the object is preserved. Still this preservation does not help it much, or not at all, for in being thus preserved it is defined as a contradiction, and contradiction dissolves itself; what contradicts itself is Nothing. However correct this may be, it is at the same time incorrect. Contradiction and Nothing are at all events distinct from one another. Contradiction is concrete, it at least has a content, it at least contains things which contradict themselves; it at least gives expression to them, it declares what it is a contradiction of: Nothing, on the contrary, does

not express anything at all, it is devoid of content, it is the absolutely empty. This concrete quality of the one and the absolutely abstract quality of the other constitute a very important difference. Further, Nothing is in no sense contradiction. Nothing does not contradict itself, it is identical with itself; it accordingly fulfils perfectly the conditions of the logical proposition that a thing should not contradict itself — or if this proposition is expressed thus, Nothing ought to contradict itself, this is an ought which has no result, for Nothing does not do what it ought, that is, it does not contradict itself. If, however, it is put in the way of a thesis thus — Nothing which exists contradicts itself, then it is plainly correct, for the subject of this proposition is a Nothing which at the same time is, but Nothing itself as such is merely simple, the one characteristic which is equivalent to itself, which does not contradict itself.

Thus, the cancelling or solution of the contradiction in Nothing, as given by the Understanding, moves *in vacuo*, or, more accurately, in contradiction itself, which in virtue of a solution of this kind declares itself in fact to be still in existence, to be unsolved. The reason why the contradiction is still uncancelled is just that the content, the contingent, is first posited only in its negation in itself, and not yet in the affirmation which must be contained in this cancelling since it is not abstract Nothing. Even the contingent is certainly, to begin with, as it presents itself to the ordinary thought, an affirmative. It represents definite Being, existence; it is the world, affirmation, Reality, or however you like to term it, and it is this enough and to spare; but as such it is not yet posited in its solution, not given in the explication of its content and substance, and it is just this content which is meant to lead to its truth, namely, the Absolutely-necessary. It is the contingent itself in which, as was said, the finitude, the limitation of the world has been indicated in order that it may itself directly point to its solution, that is, in accordance with the negative side already indicated. And

further, the analysis or resolution of this contingent which is posited as already resolved in the contradiction, is seen to be the affirmative which is contained in it. This resolution has been already referred to. It was got and adopted from the idea formed by the human mind as representing the transition of Spirit from the contingent to the Absolutely-necessary, which in accordance with this would itself be this very affirmative, the resolution of that first and merely negative resolution. So, too, to indicate the speculative element in this final and most inner point would simply mean to put in a completely connected form the thoughts which are already contained in the conception we are dealing with, namely, in that first resolution. The Understanding which conceived of it merely as contradiction which resolves itself into Nothing, takes up only one of the two moments contained in it, and leaves the other alone.

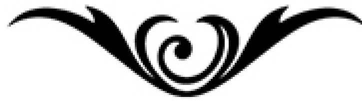
As a matter of fact the concrete result in its unfolded shape, that is, its speculative form, has been already brought under our notice, and that long ago, namely, in the definition which was given of absolute necessity. In that connection, however, an external kind of reflection and style of argument was employed in reference to the moments which belong to this necessity or from which it results. What we have got to do here is merely to call attention to those moments which are found in what we have seen to be the contradiction which is the resolution of the contingent. In absolute necessity what we found first of all was the moment of mediation, and, to begin with, of mediation through an Other. The analysis of the contingent directly shows that the moments of this mediation are Being in general, or material existence, and the negation of this, whereby it is degraded to the state of something which has a semblance of Being, something which is virtually a nullity. Each moment is not isolated and taken by itself, but is thought of as attaching to the one characteristic, namely, to the contingent, and as existing purely in relation to the Other, as having any meaning only in this relation.

This one characteristic, which holds them together, is what mediates them. In it, it is true, the one exists by means of the other; but then each can exist for itself outside of their connection, and each ought, in fact, to exist for itself, Being for itself and negation for itself. If, however, we call the former Being as it appears in the more concrete shape in which we have it here, namely, as material existence, we practically grant that this material existence is not for itself, is not absolute or eternal, but is, on the contrary, virtually a nullity which has indeed a Being, but not an independent Being, a Being-for-self, for it is just this Being possessed by it which is characterised as something contingent. Since, accordingly, in the case of contingency each of the two characteristics exists only in relation to the other, this mediation between them appears to be contingent itself, to be merely isolated, and to be found only in this particular place. The unsatisfactory thing is that the characteristics can be taken for themselves, that is to say, as they themselves are as such, and as related only to themselves, and therefore immediately and thus as not mediated in themselves. Mediation is consequently something which happens to them in a merely outward way, and is itself contingent; that is, the peculiar inner necessity of contingency is not demonstrated.

This reflection consequently leads up to the necessity of the starting-point in itself which we took as something given, as a starting-point in fact. It leads up not to the transition from the contingent to the necessary, but to the transition which is implicitly contained in the contingent itself, to the transition from one of each of the moments which constitute the contingent, to its Other. This would bring us back to the analysis of the first abstract, logical moments, and it is sufficient here to regard contingency as the act of transition in itself, as its cancelling of itself or annulling of itself, as this is ordinarily conceived of.

In the resolution of contingency just described, there is at the same time indicated the second moment, that of absolute necessity, that is, the moment of mediation with self. The moments of contingency are, to begin with, in a relation of antithesis to each other, and each is posited as mediated by its antithesis or Other. In the unity of the two, however, each is something negated, and their difference is consequently done away with, and although we still speak of one of the two, it is no longer related to something different from it, but to itself; we have thus mediation with self.

The speculative way of looking at this accordingly implies that the contingent is known in itself in so far as it is resolved into its parts, and this resolution at first takes the form of an external analysis of this characteristic. It is, however, not merely this, but is really the resolution of that characteristic in itself. The contingent is by its very nature that which resolves itself, disintegrates itself, it is transition in itself. But, in the second place, this resolution is not the abstraction of Nothing, but is rather affirmation within the resolution, that affirmation which we call absolute necessity. It is thus that we form a philosophical conception of this transition. The result is shown to be immanent in the contingent, i.e., it is the very nature of the contingent to revert back to its truth, and the elevation of our spirit to God — in so far as we have provisionally no further definition of God than the description of Him as Absolute Being, or because we for the present rest satisfied with it — is the course of development followed by this movement of the Thing or true fact. It is this Thing or true fact in-and-for-itself which is the impelling power in us, and which gives the impulse to this movement.



It has been already remarked that for the consciousness to which the determinations of thought do not present themselves in this pure speculative form, and consequently not in their self-solution and self-movement, but which represents them to itself by general ideas, the transition is rendered

more easy by the fact that the thing from which we start, namely, the contingent, already means something which resolves itself, which passes over into its Other. In this way the connection between that from which the start is made and the point ultimately reached, is made absolutely clear. This starting-point is consequently the one which is most advantageous for consciousness, and the one which is most in accordance with an end. It is the instinct of thought which implicitly makes this transition, which is the essential fact or Thing, but at the same time this instinct brings it into consciousness in the form of a determination of thought, of such a kind that it appears easy for it to represent it as a general idea merely, that is, in the form of abstract identity. When the world, in fact, is defined as the contingent, this means that reference is made to its Not-Being, while it is hinted that its truth is its Other or antithesis.

The transition is rendered intelligible by the fact that it is not only implicitly contained in the starting-point, but that this latter directly suggests the transition, that is, this characteristic is also posited and is therefore in it. In this way its determinate existence is something given for consciousness, which makes use of ordinary ideas just in so far as it has to do with immediate existence, which is here a determination or quality of thought. Equally intelligible is the result, the Absolutely-necessary; it contains mediation, and it is just this understanding of the connection in general which passes for being the easiest possible, a connection which in a finite way is taken as the connection of the one with an Other, but which, on the other hand, carries its corrective with it in so far as this connection issues in an insufficient end. A connection of this kind, owing to the fact that the law which governs it constantly requires that it should repeat itself in the matter which composes it, always lead up to an Other, that is, to a negative, while the affirmative which reappears in this act of development is simply something which issues from itself, and thus the one as well as the

Other finds no rest, and no satisfaction. The Absolutely-necessary, again, since regarded from one point of view it itself produces that connection, is something which can also break off the connection, bring back into itself this going out of itself and secure the final result. The Absolutely-necessary is, because it is; thus that Other and the act of going out towards that Other are set aside, and by this unconscious inconsequence satisfaction is secured.

SIXTEENTH LECTURE

THE FOREGOING LECTURES have dealt with the dialectical element, with the absolute fluidity, of the characteristics that enter into the movement which represents this first form of the elevation of the spirit to God. We have now further to deal with the result in itself as defined in accordance with the standpoint adopted.

This result is the absolutely necessary Essence. The meaning of a result is known to consist simply in this, that in it the determination of the mediation, and consequently of the result, has been absorbed in something higher. The mediation was the self-annulling of the mediation. Essence means what is as yet absolutely abstract self-identity; it is not subject, and still less is it Spirit. The entire determination is found in absolute necessity, which in its character as Being is at the same time what has immediate Being, and which, as a matter of fact, implicitly determines itself as subject, but at first in the purely superficial form of something having Being, in the form of the Absolutely-necessary.

The fact that this determination is not adequate to express our idea of God is a defect which we may in the meantime leave alone, inasmuch as it has been already indicated that the other proofs bring with them further and more concrete determinations. There are, however, religious and philosophical systems whose defectiveness consists just in this, that they have not got beyond the characteristic of absolute necessity. The consideration of the more concrete forms in which this principle has embodied itself in religion, belongs to the philosophy of religion and to the history of religion. Regarding the subject in this aspect, it may here be merely remarked that in general those religions which have this

determinateness as their basis have, so far as the inner logical development of concrete Spirit is concerned, richer and more varied elements than any which the abstract principle at first brings with it. In the sphere of phenomena and in consciousness the other moments of the Idea in its full and completed form, are superadded in a way which is inconsistent with that abstract principle. It is, however, essential to find out whether these additions in the way of definite form belong merely to imagination, and whether the concrete in its inner nature does not get beyond that abstraction — so that, as in the Oriental and particularly in the Indian mythology, the infinite realm of divine persons who are brought in not only as forces in general, but as self-conscious, willing figures, continues to be devoid of Spirit — or whether, on the other hand, spite of that one necessity, the higher spiritual principle emerges in these persons, and whether, in consequence, spiritual freedom comes to view in their worshippers. Thus in the religion of the Greeks we see absolute necessity in the form of Fate occupying the place of what is supreme and ultimate, and it is only in subordination to this necessity that we have the joyous company of the concrete and living Gods. These are also conceived of as spiritual and conscious, and in the above-mentioned and in other mythologies are multiplied so as to make a still larger crowd of heroes, nymphs of the sea, of the rivers, and so on, muses, fauns, &c., and are connected with the ordinary external life of the world and its contingent things, partly as chorus and accompaniment in the form of a further particularisation of one of the divine supreme deities, partly as figures of minor importance. Here necessity constitutes the abstract force which is above all the particular spiritual, moral, and natural forces. These latter, however, partly possess the character of non-spiritual, merely natural force, which remains completely under the power of necessity, while their personalities are merely personifications; and yet, although they may not exactly deserve to be

called persons, they also partly contain the higher characteristic of subjective inherent freedom. In this way they occupy a position above that of their mistress, namely, necessity, to which only the limited element in this deeper principle is subordinate, a principle which has elsewhere to await its purification from this finitude in the region of which it at first appears, and has to manifest itself independently in its infinite freedom.

The logical working out of the category of absolute necessity is to be looked for in systems which start from abstract thoughts. This application in detail of the category has reference to the relation between this principle and the manifoldness of the natural and spiritual world. If absolute necessity thus forms the basis as representing what is alone true and truly real, in what relation do material things stand to it? These things are not only natural things, but also include Spirit, the spiritual individuality with all its conceptions, interests, and aims. This relation has, however, been already defined in connection with the principle referred to. They are contingent things. Further, they are distinct from absolute necessity itself; but they have no independent Being as against it, and neither has it, consequently, as against them. There is only one Being, and this belongs to necessity, and things by their very nature form part of it. What we have defined as absolute necessity has to be more definitely hypostatised in the form of universal Being or Substance, while, in its character as a result, it is a self-mediated unity in virtue of the abrogation of mediation. It is thus simple Being, and is what alone represents the subsisting element of things. When our attention was previously called to necessity in the form of Greek Fate, it was thought of as characterless or indeterminate force; but Being itself has already come down from the abstraction referred to, to the level of the things above which it ought to be. Still, if Essence or Substance itself were merely an abstraction, things would have an independent existence of concrete individuality outside of it. It must at the same time be

characterised as the force of these things, the negative principle which makes its validity felt in them, and by means of which they represent what is perishing and transitory and has merely a phenomenal existence. We have seen how this negative element represents the peculiar nature of contingent things. They have thus this force within themselves, and do not represent manifestation in general, but the manifestation of necessity. This necessity contains things, or rather it contains them in their stage of mediation. It is not, however, mediated by something other than itself, but it is the direct mediation of itself with itself. It is the variable element or alternation of its absolute unity whereby it determines itself as mediation, that is, as external necessity, a relation of an Other to an Other, that is, whereby it spreads itself out into infinite multiplicity, into the absolutely conditioned world, but in such a way that it degrades external mediation, the contingent world to the condition of a world of appearance, and in this nullity comes into harmony with itself, posits itself as equal to itself, and does this in the world as representing its force. Everything is thus included in it, and it is immediately present in everything. It is the Being, as it also is the changeable and variable element of the world.

The determination of necessity as unfolded in the philosophical conception of it, is, speaking generally, the standpoint which we are in the habit of calling Pantheism, and sometimes in a more developed and definite form, sometimes in a more superficial form, it is what expresses the relation indicated. The very fact of the interest which this name has again awakened in modern times, and still more the interest of the principle itself, render it necessary that we should direct our attention to it. The misunderstanding which prevails with regard to Pantheism ought not to be allowed to pass without being mentioned and corrected; and after that we shall have to consider in this connection the place of the principle in the higher totality, in the true Idea of God. Since at a previous stage the consideration of the

religious form taken by the principle was dispensed with, we may, by way of bringing a picture of it before the mind, take the Hindu religion as representing Pantheism in its most developed form. With this development there is bound up at the same time the fact that the absolute Substance, the sole and only One, is represented in the form of thought as distinguished from the accidental world, as existing. Religion in itself essentially involves the relation of Man to God, and still less when it appears in the form of Pantheism does it leave the one Essence in that condition of objectivity in which metaphysic imagines it has left it as an object while preserving its special character. We have to call attention first of all to the remarkable character of this attempt to bring Substance under the conditions of subjectivity. Self-conscious thought does not only make that abstraction of Substance, but is the very act of abstraction itself. It is just that simple unity as existing for itself which is called Substance. This thought is thus conceived of as the force which creates and preserves the world, and which also alters and changes its existence as this appears in particular forms. This thought is termed Brahma. It exists as the natural self-consciousness of the Brahmans, and as the self-consciousness of others who put under restraint and kill their consciousness in its manifold forms, their sensations, their material and spiritual interests, and all the active life connected with them, and reduce it to the perfect simplicity and emptiness of that substantial unity. Thus this thought, this abstraction of men in themselves, is held to be the force of the world. The universal force takes particular forms in gods, who are nevertheless transitory and temporary; or, what comes to the same thing, all life, whether in the form of spiritual or natural individuality, is torn away from the finitude of its perfectly conditioned connection — all understanding in this latter being destroyed — and is elevated into the form of divine existence.

As we were reminded, the principle of individualisation appears in this Pantheism in its several religious shapes, in a form inconsistent with the force of substantial unity. Individuality, it is true, does not exactly get the length of being personality, but the force unfolds itself in a sufficiently wild way as an illogical transition into its opposite. We find ourselves in a region of unbridled madness in which the present in its most ordinary form is directly elevated to the rank of something divine, and Substance is conceived of as existing in finite shapes, while the shapes assumed have a volatile character and directly melt away.

The Oriental theory of the universe is in general represented by this idea of sublimity which puts all individualisation into special shapes, and infinitely extends all particular forms of existence and particular interests. It beholds the One in all things, and consequently clothes this purely abstract One in all the glory and splendour of the natural and spiritual universe. The souls of the Eastern Poets dive into this ocean and drown in it all the necessities, the aims, the cares of this petty circumscribed life, and revel in the enjoyment of this freedom, upon which they lavish by way of ornament and adornment all the beauty of the world.

It will be already clear from this picture, and this is a point upon which I have elsewhere explained my views, that the expression Pantheism, or rather the German expression in which it appears in a somewhat transposed form, that God is the One and All, or everything — τὸ ἓν καὶ πᾶν — leads to the false idea that in pantheistic religion or in philosophy, everything (*Alles*), that is, every existing thing in its finitude and particularity, is held to be possessed of Being as God or as a god, and that the finite is deified as having Being. It could only be a narrow and ordinary or rather a scholastic kind of mind which would expect this to be the case, and which, being perfectly unconcerned about what actually is, sticks to one category, and to the category, in fact, of finite particularisation, and accordingly conceives of

the manifoldness which it finds mentioned, as a permanent, existing, substantial particularisation. There can be no mistake but that the essential and Christian definition of freedom or individuality, which as free is infinite in itself and is personality, has misled the Understanding into conceiving of the particularisation of finitude under the category of an existing unchangeable atom, and into overlooking the moment of the negative which is involved in force and in the general system to which it belongs. It imagines Pantheism as saying that all, that is, all things in their existing isolation, are God, since it takes the πᾶν in this definite category as referring to all and every individual thing. Such an absurd idea has never come into anybody's head outside of the ranks of these opponents of Pantheism. This latter represents a view which is, on the contrary, quite the opposite of that which they associate with it. The finite, the contingent is not something which subsists for itself. In the affirmative sense it is only a manifestation, a revelation of the One, only an appearance of it which is itself merely contingency. The fact is that it is the negative aspect, the disappearance in the one force, the ideality of what has Being as a momentary standpoint in the force, which is the predominant aspect. In opposition to this the Understanding holds that these things exist for themselves and have their essence in themselves, and are thus in and in accordance with this finite essentiality, supposed to be divine or even to be God. They cannot free themselves from the absoluteness of their finitude, and this finitude is not thought of as something which disappears and is absorbed in this unity with the Divine, but is still preserved by them in it as existing. On the other hand, since the finite is, as they say, robbed of its infinitude by Pantheism, the finite has in consequence no longer any Being at all.

It is preferable to use the expression, "the philosophical systems of substantiality," and not to speak of systems of Pantheism, because of the false idea associated with this term. We may take the Eleatic system in

general as representing these in ancient times, and the Spinozistic as their modern representative. These systems of substantiality are, as we have seen, more logical than the religions corresponding to them, since they keep within the sphere of metaphysical abstraction. The one aspect of the defect which attaches to them is represented by the one-sidedness referred to as existing in the idea formed by the Understanding of the course taken by the spirit's elevation to God. That is to say, they start from actual existence, treat it as a nullity, and recognise the Absolute One as the truth of this existence. They start with a presupposition, they negate it in the absolute unity, but they don't get out of this unity back to the presupposition. They don't think of the world, which is considered to be merely comprised within an abstraction of contingency, of the many and so on, as produced out of Substance. Everything passes into this unity as into a kind of eternal night, while this unity is not characterised as a principle which moves itself to its manifestation, or produces it, "as the unmoved which moves," according to the profound expression of Aristotle.

(a.) In these systems the Absolute, or God, is defined as the One, Being, the Being in all existence, the absolute Substance, the Essence which is necessary not through an Other, but in-and-for-itself, the Causa Sui, the cause of itself, and consequently its own effect, that is, the mediation which cancels itself. The unity implied in this latter characteristic belongs to an infinitely deeper and more developed form of thought than the abstract unity of Being, or the One. This conception has been sufficiently explained. Causa Sui is a very striking expression for that unity, and we may accordingly give some further attention to its elucidation. The relation of cause and effect belongs to the moment of mediation through an Other already referred to, and which we saw in necessity, and is its definite form. Anything is completely mediated by an Other in so far as this Other is its cause. This is the original thing or fact as absolutely immediate and

independent; the effect, on the other hand, is what is posited merely, dependent, and so forth. In the antithesis of Being and Nothing, One and Many, and so on, the characteristics are found existing in such a way as to imply that they are matched with each other in their relation, and yet that they have, as unrelated, a valid independent existence besides. The Positive, the Whole, and so on, is, it is true, related to the Negative, to the parts, and this relation forms part of its essential meaning; but the Positive as well as the Negative, the Whole, the parts, and so on, have in addition an independent existence outside of this relation. But cause and effect have a meaning simply and solely in virtue of their relation. The meaning of the cause does not extend beyond the fact that it has an effect. The stone which falls has the effect of producing an impression on the object upon which it falls. Looked at apart from this effect which it has as a heavy body, it is physically separate and distinct from other equally heavy bodies. Or, to put it otherwise, since it is a cause while it continues to produce this impression, if we, for example, imagine its effect to be transitory, then when it strikes against another body it ceases so far to be a cause, and outside of this relation it is just a stone, which it was before. This idea haunts the popular mind chiefly in so far as it characterises the thing as the original fact and as continuing to exist outside of that effect it produces. Apart from that effect which it has produced, the stone is undoubtedly a stone, only it is not a cause. It is a cause only in connection with its effect, or, to introduce the note of time, during its effect.

Cause and effect are thus, speaking generally, inseparable. Each has meaning and existence only in so far as it stands in this relation to the other, and yet they are supposed to be absolutely different. We cling with equal firmness to the idea that the cause is not the effect and the effect is not the cause, and the Understanding holds obstinately to this fact of the

independent being of these two categories and of the absence of relation between them.

When, however, we have come to see that the cause is inseparable from the effect, and that it has any meaning only as being in the latter, then it follows that the cause itself is mediated by the effect; it is only in and through the effect that it is cause. This, however, means nothing more than that the cause is the cause of itself, and not of an Other. For this which is supposed to be an Other is of such a kind that the cause is first a cause in it, and therefore in it simply reaches itself, and in it affects only itself.

Jacobi has some reflections on this Spinozistic category, the Causa Sui ("Letters on the Doctrine of Spinoza," 2nd ed.,), and I refer to his criticisms upon it just because they afford us an example of how Jacobi, the pioneer of the party of immediate knowledge or faith, who is so much given to rejecting the Understanding in his consideration of thought, does not get beyond the mere Understanding. I pass over what he says in the passage referred to regarding the distinction between the category of ground and consequence, and that of cause and effect, and the fact that in his later controversial essays he imagines he has found in this difference a true description and definition of the nature of God. I merely indicate the more immediate conclusion referred to by him, namely, that from the interchange of the two "it may be successfully inferred that things can originate without originating, and alter without undergoing alteration, and can be before and after each other without being before and after." Such conclusions are too absurd to require any further comment. The contradiction to which the Understanding reduces a principle is an ultimate one; it is simply the limit of the horizon of thought beyond which it is not possible to go, but in presence of which we must turn back. We have, however, seen how the solution of this contradiction is reached, and we shall apply it to the contradiction in the form in which it here appears and is here stated, or

rather we shall simply briefly indicate the estimate to be formed of the above assertion. The conclusion referred to, that things may originate without originating, and alter without undergoing alteration, is manifestly absurd. We can see that it expresses the idea of self-mediation through an Other, of mediation as self-annulling mediation, but likewise that this mediation is directly abandoned. The abstract expression, Things, does its part in bringing the finite before the mind. The finite is a form of limited Being to which only one of two opposite qualities attaches, and which does not remain with itself in the Other, but simply perishes. But then the Infinite is this mediation with self through the Other, and without repeating the exposition of this conception, we may take an example from the sphere of natural things without going at all to that of spiritual existence, namely, life as a whole. What is well known to us as its self-preservation is "successfully" expressed in terms of thought as the infinite relation in virtue of which the living individual of whose process of self-preservation we alone speak here, without paying attention to its other characteristics, continually produces itself in its existence. This existence is not identical Being, Being in a state of repose, but, on the contrary, represents origination, alteration, mediation with an Other, though it is a mediation which returns to itself. The living force of what has life consists in making life originate, and the living already is; and so we may indeed say — though it is certainly a bold expression — that such and such a thing originates without originating. It undergoes alteration; every pulsation is an alteration not only in all the pulse-veins, but in all the parts of its entire constitution. In all this change it remains the same individual, and it remains such only in so far as it is this inherently self-altering active force. We may thus say of it that it alters without undergoing alteration, and finally — though we cannot certainly say that of the things — that it previously exists without existing previously, just as we have seen with regard to the cause that it exists

previously, is the original cause, while at the same time previously, before its effect, it is not a cause, and so on. It is, however, tedious, and would even be an endless task to follow up and arrange the expressions in which the Understanding presents its finite categories and seeks to give them the character of something permanent.

This annihilation of the category of causality as used by the Understanding takes place in connection with the conception which is expressed by the term Causa Sui. Jacobi, without recognising in it this negation of the finite relation, the speculative element, that is, despatches it simply in a psychological, or, if you like, in a pragmatical fashion. He declares that "it is difficult to conclude from the apodictic proposition, everything must have a cause, that it is possible everything may not have a cause. Therefore it is that the Causa Sui has been invented." It is certainly difficult for the Understanding not only to have to abandon its apodictic proposition, but to have to assume another possibility which, moreover, has a wrong look in connection with the expression referred to. But it is not hard for reason, which, on the contrary, in its character as the free, and especially as the religious human spirit, abandons such a finite relation as this of mediation with an Other, and knows how to solve in thought the contradiction which comes to consciousness in thought.

Dialectic development, such as has been here given, does not, however, belong to the systems of simple substantiality, to pantheistic systems. They do not get beyond Being or Substance, a form which we shall take up later on. This category, taken in itself, is the basis of all religions and philosophies. In all these God is Absolute Being, an Essence, which exists absolutely in-and-for-itself, and does not exist through an Other, but represents independence pure and simple.

(*b*.) Categories like these, which are of so abstract a character, do not apply very widely, and are very unsatisfactory. Aristotle ("Metaphysics," i.

5) says of Xenophanes, that “he was the first to unify (ἑνίσας), he did not advance anything of a definite nature, and so gazing into the whole Heavens — into space (ins Blaue), as we say — said, the One is God.” The Eleatics, who followed him, showed more definitely that the many and the characteristics which rest on multiplicity lead to contradiction and resolve themselves into nothing; and Spinoza, in particular, showed that all that is finite disappears in the unity of Substance, and thus there is no longer left any further, concrete, fruitful determination for this Substance itself. Development has to do only with the form of the starting-points which finds itself in presence of subjective reflection, and with that of its dialectic, by means of which it brings back into that universality the particular and finite, which appear in an independent way. It is true that in Parmenides this One is defined as thought, or that which thinks, what has Being; and so, too, in Spinoza, Substance is defined as the unity of Being (of extension) and thought. Only, one cannot therefore say that this Being or Substance is hereby posited as something which thinks, that is, as activity which determines itself in itself. On the contrary, the unity of Being and thought continues to be conceived of as the One, the Unmoved, the Stolid. There is an outward distinction into attributes and modes, movement and will, a distinction effected by the Understanding. The One is not unfolded as self-developing necessity, not, in accordance with what is indicated by its notion, as the process which mediates the necessity with itself and within itself. If the principle of movement is here wanting, it is certainly found in more concrete principles in the flux of Heraclitus, in number too, and so on; but, on the one hand, the unity of Being, the divine self-equality, is not preserved, and, on the other, a principle of this kind stands in exactly the same relation to the ordinary existing world as the Being, the One, or the Substance referred to.

(*c*.) Besides this One there is, however, the actual contingent world, Being with the quality of the Negative, the realm of limitations and things finite, and in this connection it makes no difference whether this realm is conceived of as a realm of external existence, of semblance or illusion, or, according to the definition of superficial Idealism, as a merely subjective world, a world of consciousness. This manifoldness with its infinite developments is, to begin with, separated from that Substance, and we have to find out in what relation it stands to this One. On the one hand, this definite existence of the world is merely taken for granted. Spinoza, whose system is the most fully developed, starts from definitions, that is, from the actual characteristics of thought and of ordinary ideas in general. The starting-points of consciousness are presupposed. On the other hand, the Understanding forms this accidental world into a system in accordance with the relations or categories of external necessity. Parmenides gives the beginnings of a system of the phenomenal world at the head of which the goddess Necessity is placed. Spinoza did not construct any philosophy of Nature, but treated of the other part of concrete philosophy, namely, a system of ethics. This system of ethics was from one point of view to be logically connected with the principle of absolute Substance, at least in a general way, because Man's highest characteristic, his tendency to seek after God, is the pure love of God, according to Spinoza's expression, sub specie æterni. Only, the principles which underlie his philosophical treatment of the subject, the content, the starting-points, have no connection with the Substance itself. All systematic detailed treatment of the phenomenal world, however logical it may be in itself, when it follows the ordinary procedure, and starts with what is perceived by the senses, becomes an ordinary science in which what is recognised as the Absolute itself, the One, Substance, is not supposed to be living, is not the moving principle, the method, for it is devoid of definite character. There is nothing

left of it for the phenomenal world, unless that this natural and spiritual world in general is wholly abstract, is a phenomenal world, a world of appearance, or else that the Being of the world in its affirmative form is Being, the One, Substance, while the particularisation in virtue of which Being is a world, evolution, emanation, is a falling of Substance out of itself into finitude, which is an absolutely inconceivable mode of existence. It is further implied that in Substance itself there is no principle involving the characteristic of being creative; and thirdly, that it is likewise abstract force, the positing of finitude as something negative, the disappearance of the finite.

(*Concluded* 19*th August* 1829.)

AMPLIFICATION OF THE TELEOLOGICAL PROOF IN THE LECTURES ON THE PHILOSOPHY OF RELIGION DELIVERED IN THE SUMMER OF 1831.

KANT HAS CRITICISED this proof too, as well as the other proofs of the existence of God, and it was chiefly owing to him that they were discredited, so that it is now scarcely considered worth while to look at them closely. And yet Kant says of this proof that it deserves to be always regarded with respect. When, however, he adds that the teleological proof is the oldest, he is wrong. The first determination of God is that of force or power, and the next in order is that of wisdom. This is the proof we meet with first amongst the Greeks also, and it is stated by Socrates (Xenophon, *Memor*., at the end of Book First). Socrates takes conformity to an end, especially in the form of the Good, as his fundamental principle. The reason why he is in prison, he declares, is that the Athenians consider it to be good. This proof accordingly coincides historically with the development of freedom.

We have already considered the transition from the religion of power to the religion of spirituality in general. We have already had in the intermediate stages also the very same mediation which we recognise as present in the religion of beauty, but broken up and as yet devoid of any spiritual character. But since with that transition to the religion of spirituality there is added another and essential determination, we have first to bring out its meaning in an abstract way, and direct attention to it.

Here we have the determination of freedom as such, of an activity as freedom, a working in accordance with freedom, no longer an unhindered working in accordance with power, but a working in accordance with ends.

Freedom is self-determination, and what is active has self-determination implicitly as its end in so far as it spontaneously determines itself within itself. Power is simply the act of self-projection, and implies that there is an unreconciled element in what is projected; and though this is implicitly an image or picture of the power, still it is not expressly felt in consciousness that what creates simply preserves and produces itself in its creation in suchwise that the characteristics of the Divine itself appear in the creature. God is here conceived of as possessed of the characteristic of wisdom, of activity in accordance with an end. Power is good and righteous, but action in accordance with an end is what first constitutes this characteristic of rationality, according to which nothing comes out of the act but what had been already previously determined upon, that is, this identity of the creating power with itself.

The difference which exists among the proofs of the existence of God consists simply in the difference of their determination. There is in them a mediation, a starting-point, and a point at which we arrive. In the Teleological and Physico-theological Proofs both points possess in common the characteristic of conformity to an end. We start from a form of Being which is actually characterised as in conformity with an end, and what is thereby mediated is the idea of God as positing and working out an end. Being, considered as the immediate from which we start in the Cosmological Proof, is, to begin with, a manifold, contingent Being. In accordance with this, God is defined as necessity which has Being in-and-for-itself, the force or power which is above the contingent. The higher determination accordingly is, that conformity to an end is present in Being. The rational element already finds expression in the end in the form of a free self-determination and carrying out of this content, so that this content which at first in its character as an end is inward, is realised, and the reality corresponds to the notion or end.

A thing is good in so far as it fulfils its destiny or end, and this means that the reality is adequate to the notion or destined character. In the world we perceive a harmonious working of external things, of things which exist in a relation of indifference to each other, which come into existence accidentally so far as other things are concerned, and have no essential reference to one another. Still, although things thus exist apart from each other, there is evidence of a unity in virtue of which there is an absolute conformity amongst them. Kant states this in a detailed way, as follows. The present world reveals to us an inexhaustible scene of manifold life, of order, conformity to ends, and so on. This determination in accordance with an end is seen specially in what has life, both as it is in itself and in its relation to things outside of it. Man, the animal, is something inherently manifold, has certain members, entrails, &c., and although these appear to exist alongside of each other, still the general determination in accordance with an end is present through them all and maintains them. The one exists only through the other and for the other, and all the members and component parts of men are simply means for the self-preservation of the individual which is here the end. Man, all that has life in fact, has many needs: air, nourishment, light, &c., are necessary for his sustenance. All this actually exists on its own account, and the capacity of making it minister to an end is external to it. Animals, flesh, air, and so on, which are required by Man, do not in themselves declare that they are ends, and yet the one is simply a means for the other. There is here an inner connection which is necessary, but which does not exist as such. This inner connection is not made by the objects themselves, but is produced by something else, as these things themselves are. The conformity to an end does not produce itself spontaneously; the active working in accordance with an end is outside of the things, and this harmony which implicitly exists and posits itself, is the force which presides over these objects, which destines them to stand to

each other in the relation of things whose existence is determined by an end. The world is thus no longer an aggregate of contingent things, but a collection of relations in conformity with an end, which, however, attach themselves to things from without. This relation of ends must have a cause, a cause full of power and wisdom.

This activity in accordance with an end, this cause, is God.

Kant remarks that this proof is the clearest of all, and can be understood by the ordinary man. It is owing to it that Nature first acquires an interest; it gives life to the knowledge of Nature, just as it has its origin in Nature. This is in a general form the Teleological Proof.

Kant's criticism is accordingly as follows. This proof, he says, is defective above all, because it takes into consideration merely the form of things. Reference to an end applies only to the determination of form. Each thing preserves itself, and is therefore not merely a means for others, but is an end itself. The quality in virtue of which a thing can be a means has reference to its form merely, and not to its matter. The conclusion, therefore, does not carry us further than the fact, that there is a forming cause; but we do not prove by this that matter also has been produced by it. The proof, says Kant, does not therefore adequately express the idea of God as the creator of matter and not merely of form.

Form contains the characteristics which are mutually related; but matter is to be thought of as without form, and consequently as without relation. This proof therefore stops short at a demiurge, a constructor of matter, and does not get the length of a creator. So far as this criticism is concerned, we may undoubtedly say that all relation is form, and this implies that form is separated from matter. We can see that God's activity would in this way be a finite one. When we produce anything technical we must take the material for it from the outside. Activity is thus limited and finite. Matter is thus thought of as permanently existing for itself, as eternal. That, in virtue of

which things are brought into connection with each other, represents the qualities, the form, not the permanent existence of things as such. The subsistence or permanent existence of things is their matter. It is, to begin with, undoubtedly correct that the relations of things are included within their form; but the question is, Is this distinction, this separation between form and matter admissible, and can we thus put each specially by itself? It has been shown, on the contrary, in the Logic (Encyclop. Phil., § 129), that formless matter is a nonentity, a pure abstraction of the Understanding, which we may certainly construct, but which ought not to be given out to be anything true. The matter which is opposed to God as something unalterable is simply a product of reflection, or, to put it otherwise, this identity of formlessness, this continuous unity of matter is itself one of the specific qualities of form. We must therefore recognise the truth that matter which is thus placed on one side by itself, belongs itself to the other side, to form. But then the form is also identical with itself, relates itself to itself, and in virtue of this has just the very quality which is distinguished from it as matter. The activity of God Himself, His simple unity with Himself, the form, is matter. This remaining equal to self, this subsistence is present in the form in such a way that the latter relates itself to itself, and that is its subsistence, which is just what matter is. Thus the one does not exist apart from the other; on the contrary, they are both the same.

Kant goes on to say, further, that the syllogism starts from the fact of the order and conformity to an end observable in the world. We find there arrangements in accordance with an end. It is this reference of things to an end, not found in the things themselves, which accordingly serves for the starting-point. We have in this way a third thing, a cause, posited. From the fact of arrangement in accordance with an end, we reason to the existence of its author, who has established the teleology of the relations. We cannot therefore infer the existence of anything more than what, so far as content is

concerned, is actually given in presently existing things, and is in conformity with the starting-point. The teleological arrangement strikes us as wonderfully grand, as one of supreme excellence and wisdom; but a wisdom which is very great and worthy of admiration is not yet absolute wisdom. It is an extraordinary power which is recognised as present here, but it is not yet Almighty Power. This, says Kant, is a leap which we are not justified in taking, and so we take refuge in the Ontological Proof, and this starts from the conception of the most real Essence. The mere sense-perception, however, from which we start in the Teleological Proof, does not bring us so far as this totality. It must certainly be granted that the starting-point has a smaller content than what we arrive at. In the world there is merely relative and not absolute wisdom. We must look at this more closely. We have here a syllogism. We reason from the one to the other. We start with the peculiar constitution of the world, and from this go on to conclude the existence of an active force, of something that binds together things which exist apart from each other; this represents their inner nature, their potentiality, and is not present in them in an immediate way. The form of the reasoning process here produces the false impression that God has a basis from which we start. God appears as something conditioned. The arrangement of things in accordance with an end is the condition, and the existence of God is apparently asserted to be something mediated or conditioned. This is an objection upon which Jacobi laid special stress. We try, he says, to reach the unconditioned through the conditions. But, as we have already seen, this merely seems to be the case, and this false impression disappears of itself when we reach the real meaning of the result. So far as this meaning is concerned, it will be allowed that the process is merely the course followed by subjective knowledge. This mediation does not attach to God Himself. He is certainly the Unconditioned, infinite activity which determines itself in accordance with

ends, and which has arranged the world on a teleological plan. We do not imagine, when we speak of that process of knowledge, that these conditions from which we start precede that infinite activity. On the contrary, this represents the process of subjective knowledge only, and the result we reach is that it is God who has established these teleological arrangements, and that therefore they represent something established in the first instance by Him, and are not to be regarded as something fundamental. The ground or principle from which we start disappears in what is characterised as the true principle. This is the meaning of the conclusion, that what conditions is itself in turn explained to be the conditioned. The result declares that to posit as the foundation what is itself conditioned would be to introduce a defective element. This procedure accordingly, both actually and as regards its end, is not merely subjective, not something which goes on merely in thought; on the contrary, this defective side is itself removed by means of the result. The objective thus asserts its presence in this form of knowledge. There is not only an affirmative transition here, but there is also a negative moment in it, which is not, however, posited in the form of the syllogism. There is therefore a mediation which is the negation of the first immediacy. The course followed by Spirit is, it is true, a transition to the activity which is in-and-for-itself and posits ends, but, it is involved in the course thus followed, that the actual existence of this teleological arrangement is not held to represent Being in-and-for-itself. This is found only in reason, the activity of eternal reason. That other Being is not true Being, but only an appearance or semblance of this activity.

In dealing with the determination of ends, we must further distinguish between Form and Content. If we consider form pure and simple, we have Being in accordance with an end which is finite, and, so far as form is concerned, its finitude consists in the fact that the end and means, or the material in which the end is realised, are different. This is finitude. We thus

use a certain material in order to carry out our ends, since the activity and the material are different. The finitude of form is what constitutes the finitude of Being in accordance with an end. The truth of this relation, however, is not anything of this kind. On the contrary, the truth is in the teleological activity which is means and matter in itself, a teleological activity which accomplishes its ends through itself. This is what is meant by the infinite activity of the end. The end accomplishes itself, realises itself through its own activity, and thus comes into harmony with itself in the process of realising itself. The finitude of the end consists, as we saw, in the separableness of means and material. Viewed thus, the end represents what is as yet a technical mode of action. The truth of the determination of the end consists in the fact that the end has within itself its means, as also the material in which it realises itself. Regarded in this aspect, the end is true so far as the form is concerned, for objective truth consists simply in the correspondence between the notion and reality. The end is true only when what uses the means, and the means, as well as the reality, are identical with the end. The end thus presents itself as something which possesses reality in itself, and is not something subjective, one-sided, the moments of which exist outside of it. This is the truth of the end, while the teleological relation seen in finitude represents, on the contrary, something untrue. It is necessary to remark here that teleological activity as representing a relation thus defined in accordance with its truth, exists in the form of something higher, which is, however, at the same time present, and which we can certainly speak of as the Infinite, since it is a teleological activity which has both material and means in itself. Regarded from another point of view, however, it is finite as well. Teleological determination in this its true form, which is the form we require it to have, is found actually existing, though only in one of its aspects, in what has life, in what is organic. Life as the subject is the soul. This latter is the end, that is, it posits itself, realises

itself, and thus the product is the same as the thing that produces. What has life is, however, an organism; the organs are the means. The living soul has a body in itself, and it is only in union with this that it constitutes a whole, something real. The organs are the means of life, and these very means, the organs themselves, are also the element in which life realises and maintains itself, they are material also. This is self-preservation. What has life preserves itself; it is beginning and end; the product is at the same time what begins. The living as such is constantly in a state of activity. The feeling of need is the beginning of activity, and impels to the satisfaction of the need, and this satisfaction, again, is the beginning of a new need. The living exists only in so far as it is constantly a product. This gives us the truth of the end so far as form is concerned. The organs of the living being are means, but they are equally the end; in exercising their activity they produce themselves only. Each organ maintains the other, and in this way maintains itself. This activity constitutes an end, a soul, which is present in every point of the organism. Every part of the body experiences sensation; the soul is in it. Here we have teleological activity in its true form. But the living subject is also something thoroughly finite. The teleological activity presents here the character of something which is formally true, but which is not complete. The living being produces itself; it has the material of production in itself. Each organ excretes animal lymph which is made use of by other organs in order to reproduce themselves. The living being has the material in itself, only this is merely an abstract process. Finitude shows itself in this, that while the organs draw their nourishment from themselves they employ material for this taken from the outside. Everything organic is related to inorganic Nature, which has a definite independent existence. Regarded in one aspect, the organism is infinite since it represents a circle of pure return into self; but it is at the same time in a state of tension relatively to external inorganic Nature, and has its needs. Here the means

come from the outside. Man requires air, light, water; he also feeds on other living things, on animals which he in this way reduces to the state of inorganic Nature, to means. It is this relation particularly which leads to the idea of a higher unity representing that harmony in which the means correspond to the end. This harmony is not found in the subject itself, and yet it has in it the harmony which constitutes organic life, as we have seen. The whole construction of the organs, of the nerve and blood system, of the entrails, lungs, liver, stomach, and so on, presents a remarkable agreement. But does not this harmony itself demand something else outside of the subject? We may let this question alone at present; for if we get a grip of the notion of organism such as has been given, then this development of teleological determination is itself a necessary consequence of the living nature of the subject in general. If we do not get a grip of that notion, then the living being will not be the concrete unity referred to. In order to understand what life is, recourse is accordingly had to external mechanical modes of conception as illustrated by the action of the blood, and to chemical conceptions as seen in analysis of foods. It is not, however, possible by such processes to discover what life itself is. It is necessary to suppose the existence of some third thing which has brought these processes into existence. As a matter of fact, however, it is just the subject which is this unity, this harmony of the organism. Still this unity involves the relation of the living subject to external Nature, which is thought of as having a merely indifferent and accidental connection with the subject.

The conditions involved in this relation do not form the sole basis of the development of what has life; still, if the living being did not find these conditions ready to hand, it could not possibly exist. The observation of this fact directly produces the feeling that there must exist something higher which has introduced this harmony. It at once awakens sympathetic attention and admiration in men. Every animal has its own narrow range of

means of sustenance, and indeed many animals are limited to a single source of sustenance, human nature having in this respect also the most general character. This fact accordingly, that there exists for every animal this outward particular condition, rouses in Man that feeling of astonishment which passes over into a sense of exalted reverence for that third something which has brought about this unity. This represents Man's elevation to the thought of that higher existence which produces the conditions necessary for the accomplishment of its end. The subject secures its own preservation, and the act whereby it does this is, further, in all living things an unconscious one, is what in animals we term instinct. The one gets its means of sustenance by force, the other produces it with the help of art. This it is which we term the wisdom of God in Nature, in which we meet with that infinitely manifold arrangement in respect of the various activities and conditions necessary to the existence of all particular things. When we consider all those particular forms in which the living being shows its activity, we find that they are contingent, so to speak; that they have not been produced by the subject itself, and necessitate the existence of a cause outside of them. The fact of life merely involves self-preservation in general; but living beings differ from one another in an infinite variety of ways, and this variety is the work of something other than themselves. The question is simply this, How does inorganic Nature pass over into organic Nature, and how is it possible for it to serve as a means for what is organic? We are here met by a peculiar conception of the way in which these two come together. Animals are inorganic as contrasted with men, and plants are inorganic as contrasted with animals. But Nature, which is in itself inorganic, as represented, for instance, by the sun, the moon, and in general by what appears in the form of means and material, is in the first instance immediate, and exists previous to the organic. Regarded in this way, the relation is one in which the inorganic is independent, while, on the

other hand, the organic is what is dependent. The former, the so-called immediate, is the unconditioned. Inorganic Nature appears complete in itself; plants, animals, men, approach it in the first instance from the outside. The earth might have continued to exist without vegetation, the vegetable kingdom without animals, the animal kingdom without men. These various forms of existence thus seem to be independent and to be there for themselves. We are in the habit of referring to this as a matter of experience. Thus there are mountains without any vegetation, without animals and men. The moon has no atmosphere, there does not go on in it any meteorological process such as supplies the conditions necessary for vegetation. It thus exists without having any vegetative nature, and so on. Inorganic existence of this kind appears as independent, and Man is related to it in an external way. The idea thus arises that Nature is in itself a producing force which creates blindly, and out of which vegetation comes. From this latter in turn comes what is animal, and then finally Man possessed of conscious thought. We can undoubtedly assert that Nature produces stages of which the one is always the condition of that which follows. But then, since organic life and Man thus appear on the scene in an accidental way, the question arises whether or not Man will get what is necessary. According to the idea referred to, this is equally a matter of chance, since here there is no unity having a valid existence on its own account. Aristotle gave expression to the same idea. Nature is constantly producing living things, and the point is whether or not these will be able to exist. Whether or not any of the things thus produced will be able to maintain itself, is a pure matter of accident. Nature has already made an endless number of attempts, and has produced a host of monstrosities; myriads of beings of various forms have issued from her which were not, however, able to continue in existence, and besides, she did not concern herself at all with the disappearance of such forms of life. By way of

proving this assertion, people are in the habit of directing attention specially to the remains of monsters which are still to be found here and there. These species disappeared, it is asserted, because the conditions necessary to their existence had ceased. Regarded in this fashion, the harmony which exists between the organic and the inorganic is held to be accidental. There is here no necessity to begin and ask about a unity. The presence of design is itself affirmed to be accidental. Now, here is what is really involved in this conception. What, speaking generally, we call inorganic Nature as such is thought of as having an independent existence, while the organic is attached to it in an external fashion, so that it is a mere matter of chance whether or not the organic finds the conditions of existence in what confronts it. So far as the form of what essentially constitutes the conception is concerned, we have to remark that inorganic Nature is what comes first, is what is immediate. It was in harmony with the childlike ideas of the Mosaic age that the heavens and the earth, light, and so on, should have been thought of as created first, while the organic appeared later in point of time. The question is this: Is that the true definition or essential nature of the notion of the inorganic, and do living things and Man represent what is dependent? Philosophy, on the other hand, explains the truth involved in the definition of the notion; and apart from this, Man is certain that he is related to the rest of Nature as an end, and that Nature is meant to be a means so far as he is concerned, and that this represents the relation in which the inorganic in general stands to the organic. The organic is in its formal aspect, and by its very nature, something which exists in accordance with an end. It is means and end, and is therefore something infinite in itself. It is an end which returns back into itself; and even regarded as something dependent on what is outside of it, it has the character of an end, and consequently it represents what is truly first in comparison with what has been termed the immediate, in comparison, that is, with Nature. This immediacy is merely one-sided

determination, and ought to be brought down to the level of something that is merely posited. This is the true relation. Man is not an accident added on to what is first; but, on the contrary, the organic is itself what is first. The inorganic has in it merely the semblance of Being. This relation is logically developed in Science itself.

This relation, however, still involves an element of separation, as seen in the fact that the organic, regarded from one side, is related outwardly to inorganic Nature, which is not posited as existing in the organic itself. The living being develops out of the germ, and the development is the action of the limbs, the internal organs, and so on; the soul is the unity which brings this about. The truth, however, of organic and inorganic Nature here also is simply the essential relation between the two, their unity and inseparability. This unity is a third something which is neither the one nor the other. It is not found in immediate existence. The absolute determination which brings both, the organic as well as the inorganic, into unity, namely, the subject, is the organic; while the other appears as object, but changes itself into the predicate of the organic, into something which is held to belong to it. This is the reciprocal element in this relation. Both are put into one, and in this one each is something dependent and conditioned. We might call this third something, the thought to which consciousness raises itself, God, using the word in a general sense. It falls, however, very far short of the Notion of God. Taken in this sense, it represents the activity of production, which is a judgment whereby both sides are produced together. In the one Notion they harmonise and exist for one another. The thought to which we rise, namely, that the truth of the relation of ends is this third something, is thus absolutely correct, taking that third thing in the sense in which it has just been defined. Taken thus, however, it is defined in a formal way, and the definition rests, in fact, on something whose truth it is. It is itself living activity; but this is not yet Spirit, rational action. The correspondence

between the Notion as representing the organic, and reality as representing the inorganic, simply expresses the essence of life itself. It is involved in a more definite form in what the ancients called the νοῦς. The world is a harmonious whole, an organic life which is determined in accordance with ends. It was this which the ancients held to be νοῦς, and, taken in a more extended signification, this life was also called the world-soul, the λόγος. All that is posited here is simply the fact of life, and it is not implied that the world-soul is distinguished as Spirit from this active life belonging to it. The soul is simply the living element in the organic; it is not something apart from the body, something material, but is rather the life-force which penetrates the body. Plato accordingly called God an immortal ξῶον, that is, an eternally living being. He did not get beyond the category of life. When we grasp the fact of life in its true nature, it is seen to be one principle, one organic life of the universe, one living system. All that is, simply constitutes the organs of the one subject. The planets which revolve round the sun are simply the giant members of this one system. Regarded in this fashion, the universe is not an aggregate of many accidents existing in a relation of indifference, but is a system endowed with life. With this thought we have not, however, yet reached the essential characteristic of Spirit.

We have considered the formal aspect of the relation of ends. The other aspect is that of the content. The question here may take any of the following forms: What are the essential characteristics of the end, or what is the content of the end which is being realised, or how are these ends constituted in respect of what is called wisdom? So far as the content is concerned, the starting-point is the same as that of experience. We start, that is, from immediate Being. The study of ends in the form in which we actually meet with them, has, when pursued from this side, contributed more than anything else to the neglect of the teleological proof, so much so indeed that this latter has come to be regarded with disdain. We are in the

habit of speaking of the wise arrangements of Nature. The various and manifold kinds of animals are, as regards the real nature of the life they have, finite. The external means necessary for this life actually exist; life in its various forms is the end. If accordingly we ask what the substance of this end is, it is seen to be nothing else save the preservation of these insects, of these animals, &c. We may indeed find pleasure in contemplating their life; but the necessity of their nature and destiny is of an absolutely insignificant kind, or, to put it otherwise, is an absolutely insignificant conception. When we say, God has made things thus, we are making a pious observation, we are rising to God; but when we think of God we have the idea of an absolute, infinite end, and these petty ends present a sharp contrast to what we recognise as His actual nature. If we now consider what goes on in higher spheres of existence, and look at human ends, which we may regard as relatively the highest of all, we see that they are for the most part frustrated and disappear, leaving no permanent result. In Nature millions of seeds perish just when they begin to exist, and without ever being able to develop the life-force in them. The life of the largest portion of living things is based on the destruction of other living things; and the same holds good of higher ends. If we traverse the domain of morality, and go on even to its highest stage, namely, civil life, and then consider whether the ends here are realised or not, we shall find, indeed, that much is attained, but that still more is rendered abortive, and destroyed by the passions and wickedness of men; and this is true of the greatest and most exalted ends. We see the earth covered with ruins, with remains of the splendid edifices and works left by the finest nations whose ends we recognise as having a substantial value. Great natural objects and human works do indeed endure and defy time, but all that splendid national life has irrecoverably perished. We thus see how, on the one hand, petty, subordinate, even despicable designs are fulfilled; and, on the other, how those which are recognised as having substantial

value are frustrated. We are here certainly forced to rise to the thought of a higher determination and a higher end, when we thus lament the misfortune which has befallen so much that is of high value, and mourn its disappearance. We must regard all those ends, however much they interest us, as finite and subordinate, and ascribe to their finitude the destruction which overtakes them. But this universal end is not discoverable in experience, and thus the general character of the transition is altered, for the transition means that we start from something given, that we reason syllogistically from what we find in experience. But then what we find present in experience is characterised by limitation. The supreme end is the Good, the general final-end of the world. Reason has to regard this end as the absolute final-end of the world, and must look upon it as being based purely on the essential nature of reason, beyond which Spirit cannot go. Reason in the form of thought is, however, recognised as being the source of this end. The next step accordingly is that this end should show that it is accomplished in the world. But the Good is what has a determinate character in-and-for-itself by means of reason; and to this, Nature stands opposed, partly as physical Nature which follows its own course and its own laws, and partly as the natural element in Man, his particular ends which are opposed to the Good. If we go by what our senses show us, we find much that is good in the world, but also an infinite quantity of evil, and we would just have to reckon up the amount of evil, and the amount of good which does not attain realisation, in order to discover which preponderates. The Good, however, is something absolutely substantial; it belongs to the very essence of its nature that it should be realised. But it is something which merely ought to be real, for it cannot reveal itself in experience. It stops short with being something which ought to exist, something which is a postulate. But since the Good has not itself the power thus to realise itself, it is necessary to postulate a third thing through which the final-end of the

world will be realised. This is an absolute postulate. Moral good belongs essentially to Man; but since his power is finite, and since the realisation of the Good in him is limited owing to the natural element attaching to him, since, in fact, he is himself the enemy of the Good, it is not within his power to realise it. The existence of God is here conceived of simply as a postulate, as something that should be, and which should have for Man subjective certainty, because the Good represents what is ultimate in his reason. But this certainty is merely subjective; it remains merely a belief, an ideal, and it cannot be shown that it actually exists. Aye, if the Good is to be really moral and present, then we should have to go the length of requiring and presupposing the perpetual existence of the discord, for moral Good can only exist and can only be in so far as it is in conflict with evil. It would thus be necessary to postulate the perpetual existence of the enemy, of what is opposed to the Good. If, then, we turn to the content, we find it to be limited; and if we go on to the supreme end, we find ourselves in another region, where we start from what is inward, not from what is actually present and supplied by experience. If, on the other hand, we start from experience, the Good, the final-end is something subjective merely, and in this case the contradiction between Man's finite life and the Good would have to exist always.

AMPLIFICATION OF THE TELEOLOGICAL AND ONTOLOGICAL PROOFS GIVEN IN THE LECTURES ON THE PHILOSOPHY OF RELIGION FOR THE YEAR 1827.

AMONGST THE PROOFS of the existence of God, the Cosmological occupies the first place. Only in it is the affirmative, absolute Being, the Infinite, defined not merely as infinite in general, but, in contrast to the characteristic of contingency, as absolutely necessary. The True is the absolutely necessary Essence, and not merely Being or Essence.

This category already involves other characteristics. In fact, these proofs might be multiplied by dozens; each stage of the logical Idea may contribute its quota. The characteristic of absolute necessity is involved in the course of thought described.

The absolutely necessary Essence, taken in a general, abstract sense, is Being not as immediate, but as reflected into itself. We have defined Essence as the non-finite, the negation of that negative we term the finite. That to which we make the transition is thus not abstract Being, barren Being, but Being which is the negation of the negation.

It involves in it the element of difference, the difference which carries itself back into simplicity. In this Infinite, this absolute Being or Essence, there is thus involved the determination of difference, negation of the negation, but difference as it relates itself to itself. But determination of this kind is what we call self-determination. Negation is determination or specification, negation of determination is itself an act of determination. To posit a difference, is just to posit a determination. Where there is no negation, there is no difference, no determination.

In this unity, in this absolute Being, there is thus involved determination in general, and it is indeed in it since it is self-determination. It is thus defined as determination which is in itself and does not come from without. This unrest is involved in its very nature as the negation of the negation, and this unrest determines itself more definitely as activity. This determination of Essence in itself is Necessity in itself, the positing of determination, of difference, and the cancelling and absorption of it in such a way that the one is action, and this self-determination thus reached remains in simple relation to itself.

Finite Being does not continue to be an Other; there is no gulf between the Infinite and the finite. The finite is something which cancels itself, loses itself in something higher, so that its truth is the Infinite, what has Being in-and-for-itself. Finite, contingent Being is something which implicitly negates itself, but this negation which it undergoes is just the Affirmative, a transition to affirmation, and this affirmation is the absolutely necessary Essence.

Another form of the argument, the basis of which is constituted by the same characteristic, and which is the same in respect of the characteristic of the form, though the content is greater, is seen in the Physico-theological or Teleological Proof. Here, too, we have finite Being on one side; but it is not determined merely abstractly as Being only, but as something which has in it a determination with a richer content, that of something living. Life taken in its more specific sense implies that there are ends in Nature, and that there is an arrangement in conformity with these ends, which is, at the same time, not produced by these ends, so that the orderly arrangement is there independently for itself, and though from a different point of view it may be characterised as an end also, still what is thus actually given shows itself to be in conformity with these ends.

The physico-theological method of regarding the world can be merely the study of outward teleological arrangement, and so this way of looking at things has fallen into discredit, and justly too; for here we have to do merely with finite ends, which require means, as, for instance, the fact that Man requires this or that for his animal life. This might be further specified. If we regard these ends as something primary, and hold that there exist means for the satisfaction of these ends, and that it is God who permits these means to exist for the sake of such ends, then we very soon come to see that this method of regarding things is inadequate to express what God is.

These ends, in so far as they appear in definite special forms, are seen to be essentially unimportant, so that we cannot possibly hold them in high esteem, and cannot conceive that they represent something which is the direct object of the will and wisdom of God. All this has been summed up in one of Goethe’s Xenien. There some one is represented as praising God the Creator, on the ground that He created the cork tree in order that we might have stoppers.

We may remark in reference to the Kantian philosophy that Kant, in his “Critique of Judgment,” adduced the important conception of inner ends, that is, the conception of life-force. This is Aristotle’s conception, namely, that every living thing is an end which has its means in itself, its members, its organisation; and the process of these members constitutes the end, that is to say, the movement of life.

This is infinite, not finite conformity to an end, in which end and means are not outside themselves. The means produces the end, and the end the means. The world is living, it contains the movement of life and the realm of living things. What has not life — inorganic Nature, the sun, the stars — stands in an essential and direct relation to what has life, and to Man in so far as he in a measure belongs to living Nature, and partly because he sets

particular ends before himself. This finite conformity to an end is found in Man.

That is the characteristic note of life in general, and at the same time of life as it actually is, life as seen in the world. This, it is true, is life in itself, inner conformity to an end; but it means that each kind or species of life represents a very narrow sphere, and has a very limited nature.

The real advance accordingly is from this finite mode of life to absolute, universal conformity to an end, to the thought that this world is a κόσμος, a system, in which everything has an essential relation to everything else, and nothing is isolated; something which is regularly arranged in itself, in which everything has its place, is closely connected with the whole, subsists through the whole, and thus takes an active part in the production, in the life of the whole.

The main point thus is that a transition is made from finite life to one universal life, to one end which is articulated into particular ends, in such a way that in this particularisation things are in a condition of harmony and of reciprocal essential relation.

God is defined, to begin with, as the absolutely necessary Essence; but this definition, as Kant has already observed, falls very far short of expressing the conception of God. God alone is the absolute necessity, but this definition does not exhaust the conception of God; the definition in which He is described as the universal life-force, the one universal life, is both higher and deeper.

Since life is essentially subjectivity, something living, this universal life is subjective, the νοῦς, a soul. Thus the idea of the soul is involved in the universal life, the characteristic of the one all-disposing, all-ruling, organising νοῦς.

As regards the formal element here, we have to note the very same thing as we found in connection with the previous proofs. We have here once

more the transition of the Understanding; because there are arrangements, ends of a like kind, there is a wisdom which disposes and orders everything. But the act of rising to this thought involves at the same time the negative moment, which is the main point, namely, that this life, these ends as they actually are, and as existing in their immediate finite form, do not represent what is true. On the contrary, it is this one life movement, this one νοῦς, which is what is true.

There are not two things; there is indeed a starting-point, but the mediation is of such a character that in the transition what is the first does not continue to be the basis, the condition. On the contrary, its untruth, its negation, is involved in this transition; the negation of the negative, finite element in it, the negation of the particularity of life. This negative is negated, and in this act of elevation, finite particularity disappears. As representing truth, the object of consciousness is the system of one life movement, the νοῦς of one life movement, the soul, the Universal Soul.

Here it happens again that this definition: God is the one universal active force of life, the soul which produces, posits, organises a κόσμος, is a conception which does not yet suffice to express the conception of God. It is essentially involved in the conception of God that He is Spirit.

We have still to consider the third, essential and absolute form from this point of view. In the transition just referred to, the content was life, the finite life movement, immediate life which actually exists. Here in the third form the content which forms the basis is Spirit. Put in the form of a syllogism, it runs thus: Because finite minds exist or are, — and it is Being which here constitutes the starting-point, — therefore the absolute Mind or Spirit exists or is.

But this "because," this merely affirmative relation, is defective in this respect, that the finite minds would require to be thought of as the basis, and God would be a consequence of the existence of finite minds. The true form

is: There are finite minds, but the finite has no truth, the truth of the finite spirit is the absolute Spirit.

The finitude of finite minds is no true Being; it is by its very nature dialectic, which implies that it abrogates itself, negates itself, and the negation of this finitude is affirmation as infinitude, as something universal in-and-for-itself. This is the highest form of the transition; for the transition is here Spirit itself.

There are in this connection two characteristics, Being and God. In so far as we start from Being, this latter, looked at as it first shows itself, is directly finite. Since these characteristics exist, we could equally as well begin from God and go on to Being, though, when we say we could, we must remember that we cannot speak of what we can do in connection with the conception of God, because He is absolute necessity.

This starting-point when it thus appears in finite form does not yet involve Being; for a God who is not, is something finite, and is not truly God. The finitude of this relation consists in the fact that it is subjective, that it is this general conception in fact. God has existence, but He has only this purely finite existence in our idea of Him.

This is one-sided; we have introduced into this content, namely, God, the taint of that one-sidedness, that finitude, which is termed the idea of God. The main point is that the idea should get rid of this defect whereby it is something merely represented in the mind, something subjective, and that this content should have attached to it the determination of Being.

We have to consider this second mediation as it appears in this finite form, or form of the Understanding, in the shape of the Ontological Proof. This proof starts from the Notion or conception of God, and goes from this to Being. We do not find this transition amongst the ancients, for instance in Greek philosophy, nor was it made in the Christian Church till after a long time. It was one of the great scholastic philosophers, Anselm, Archbishop

of Canterbury, that profound, philosophical thinker, who first grasped this idea.

We have the idea of God; but He is not merely an idea, He is. How are we to make this transition? How are we to get to see that God is not merely something subjective in us? How is this determination of Being to be mediated with God?

The Kantian criticism was directed against this so-called Ontological Proof too, and with triumphant success, so to speak, in its day. It is still held at the present day that these proofs have been refuted as being worthless efforts on the part of the Understanding. We have, however, already recognised the fact that the act whereby these higher thoughts are here reached is the act of Spirit, the act peculiarly belonging to thinking Spirit, which Man will not renounce the right to exercise; and so, too, this proof is an act of the same sort.

The ancients did not know of this transition; for, in order to arrive at it, it is necessary that Spirit should go down into itself as deeply as possible. Spirit, when once it has arrived at its highest form of freedom, namely, subjectivity, first conceives this thought of God as subjective, and reaches first this antithesis of subjectivity and objectivity.

Anselm expressed the nature of this transition in the following fashion. The idea of God is that He is absolutely perfect. If accordingly we think of God only as idea, then we find that what is merely subjective, and merely represented in the form of an idea, is defective, and not perfect; for that is the more perfect which is not merely represented as an idea, but also is, really is. Therefore, since God is what is most perfect, He is not idea merely, but, on the contrary, He is possessed of actuality or reality.

The later, broader, and more rational form which represents the development of this thought of Anselm asserts that the conception or

Notion of God implies that He is the Substance of all realities, the most real Essence. But Being also is reality, therefore Being belongs to Him.

It has been urged against this that Being is no reality, that it does not belong to the reality of a notion. Reality in a notion or conception implies determinate content in a notion, but Being adds nothing to the notion or to the content of the notion. Kant has put it in the following plausible form: I form an idea of a hundred thalers; but the notion or conception, the determinateness of the content is the same whether I form an idea of them, or whether I actually possess them.

As against the first proposition that Being ought to follow from the Notion in general, it has been urged that Notion and Being are different from each other: the Notion thus exists for itself, while Being is different. Being must come to the Notion from the outside, from elsewhere. Being is not involved in the Notion. This can be put in a very plausible way by the aid of the hundred thalers.

In ordinary life an idea of a hundred thalers is called a notion or conception. That is not a notion at all in which you may have any kind of determination of content. It is certainly true that Being may not belong to an abstract sense-idea such as blue, or to any determinateness of the Understanding which happens to be in my mind; but then this ought not to be called a notion.

The Notion, and still more the absolute Notion, the Notion in-and-for-itself, the Notion of God, is to be taken for itself, and this Notion contains Being as a determinate characteristic. Being is a form of the determinateness of the Notion. This may easily be shown to be the case in two ways.

First of all, the Notion is essentially the Universal which determines itself, which particularises itself; it is what has the active power of differentiation, of particularising and determining itself, of positing a

finitude, and of negating this its own finitude, and of being through the negation of this finitude identical with itself.

This is the Notion in general. This is just what the Notion of God, the absolute Notion, God, really is. God as Spirit or as love means that God particularises Himself, begets the Son, creates the world, an Other of Himself, and possesses Himself, is identical with Himself, in this Other.

In the Notion in general, and still more in the Idea, what, in fact, we see is, that through the negation of the particularisation, the positing of which is at the same time the work of the activity which He Himself is, He is identical with Himself, relates Himself to Himself.

The primary question is, What is Being? what is this attribute, this determinateness, namely, reality? Being is nothing but the unutterable, the inconceivable; it is not that concrete something which the Notion is, but merely the abstraction of reference to self. We may say, it is immediacy, Being is the Immediate in general, and conversely the Immediate is Being, it is in relation to itself, that is, the mediation is negated.

This determination, namely, reference to self, or immediacy, accordingly directly exists for itself in the Notion in general, and it is involved in the absolute Notion, in the Notion of God, that He is reference to self. This abstract reference to self is directly found in the Notion itself.

The Notion is what has life, what is self-mediating; and so Being, too, is one of its characteristics. Being is different from the Notion to this extent, that Being is not the entire Notion, but is only one of its characteristics, merely that simple aspect of the Notion in virtue of which it is at home with itself, is self-identity.

Being is the determination which is found in the Notion as something different from the Notion, because the Notion is the whole of which Being is only one determination. The other point is that the Notion contains this determination in itself, this latter is one of its determinations; but Being is

also different from the Notion, because the Notion is the totality. In so far as they are different, mediation forms a necessary element in their union.

They are not immediately identical; all immediacy is true and real only in so far as it is mediation within self, and conversely all mediation, in so far as it is immediacy in itself, has reference to self. The Notion is different from Being, and the peculiar quality of the difference lies in this that the Notion absorbs and abolishes it.

The Notion is the totality, represented by the movement, the process, whereby it makes itself objective. The Notion as such, as distinct from Being, is something purely subjective, and that implies a defect. The Notion, however, is all that is deepest and highest. The very idea of the Notion implies that it has to do away with this defect of subjectivity, with this distinction between itself and Being, and has to objectify itself. It is itself the act of producing itself as something which has Being, as something objective.

Whenever we think of the Notion, we must give up the idea that it is something which we only possess, and construct within ourselves. The Notion is the Soul, the final-end of an object, of what has life; what we call Soul is the Notion, and in Spirit, in consciousness, the Notion as such attains to existence as a free Notion existing in its subjectivity as distinct from its reality as such.

The sun, the animal is the Notion merely, but has not the Notion; for them the Notion has not become objective. It is in consciousness and not in the sun that we find that division which is called I, the existing Notion, the Notion in its subjective reality, and I, this Notion, am the subjective.

No man, however, is content with his mere self-hood. The Ego is active, and this activity shows itself in objectifying self, in giving to it reality, definite existence. In its more extended and concrete signification, this activity of the Notion is impulse. All sense of satisfaction arises through

this process whereby subjectivity is done away with, and what is inward and subjective is posited as at the same time outward, objective, and real, that process by which the unity of the merely subjective and merely objective is brought about, and the two are stripped of their one-sidedness.

There is nothing so well illustrated by all that goes on in the world as the abolition of the antithesis of subjective and objective, whereby the unity of the two is effected.

The thought of Anselm, therefore, so far as its content is concerned, is the truer and more necessary thought; but the form of the proof deduced from it is certainly defective in the same way as the modes of mediation previously referred to. This unity of Notion and Being is hypothetical, and its defect consists just in the very fact of its being hypothetical.

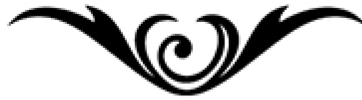
What is presupposed is that the pure Notion, the Notion in-and-for-itself, the Notion of God, is, involves Being also.

If we compare this content with faith or immediate knowledge, we shall find that the content is the same as that of Anselm's presupposition.

When the matter is regarded from this standpoint of immediate knowledge, what is said is this. It is a fact of consciousness that I have the idea of God, and along with this idea, Being must be given, so that Being is bound up with the content of the idea. If it is said that we believe it, that we know it immediately, then the unity of the idea and Being is expressed in the form of the presupposition just exactly as it is in Anselm's argument, and we have not got one bit further. This is the presupposition we everywhere meet with in Spinoza too. He defines the Absolute Cause, Substance, as that which cannot be thought of as not existing, the conception of which involves existence; that is, the idea of God is directly bound up with Being.

This inseparableness of Notion and Being is found in an absolute form only in the case of God. The finitude of things consists in the fact that the

Notion, and the determinate form of the Notion, and the Being of the Notion, are essentially different. The finite is what does not correspond to its notion or rather to the Notion.



We have the notion of Soul; the reality, the Being is represented by the corporeal form. Man is mortal; we express this truth also by saying, Soul and body can part. There we have the fact of separation, but in the pure Notion we have the inseparableness referred to.

When we say that every impulse is an example of the Notion which realises itself, we are saying what is formally correct; the impulse which has received satisfaction is undoubtedly infinite so far as the form is concerned. But the impulse has a content, and so far as the determinate character of its content is concerned, it is finite and limited; in this respect it does not correspond to the Notion, to the pure Notion.

This is the explanation of what is involved in the standpoint of the knowledge of the Notion. What was considered last was the knowledge of God, the certainty of the existence of God in general. The essential thought in this connection is the following. When we have knowledge of an object, the object is before us; we are directly related to it. But this immediacy involves mediation, what was called the act of rising to God, the fact that the human spirit comes to consider the finite as non-existent.

By means of this negation Man's spirit raises itself to God, brings itself into harmony with God. The conclusion: I know that God is, is the simple relation which has originated in this negation.

AMPLIFICATION OF THE ONTOLOGICAL PROOF IN THE LECTURES ON THE PHILOSOPHY OF RELIGION FOR THE YEAR 1831.

IN THE SPHERE of revealed religion what we have first to consider is the abstract Notion or conception of God. This free, pure revealed Notion is what forms the basis. The manifestation of the Notion, its Being for an Other, is its existence, and the region in which this existence shows itself is the finite spirit. This is the second point — finite Spirit and finite consciousness are concrete. The chief thing in this religion is to attain to a knowledge of the process whereby God manifests Himself in the finite spirit, and is identical with Himself in it. The third point is the identity of the Notion and existence. Identity here is, strictly speaking, an awkward expression, for what we have in God is essentially life.

In the forms hitherto treated of we advanced from what was lower to what was higher, and took as the starting-point one definite form of existence regarded in its different aspects. Being was first taken in its most comprehensive aspect as contingent Being, in the Cosmological Proof. The truth of contingent Being is Being necessary in-and-for-itself. Existence was then further conceived of as involving relations of ends, and this supplied us with the Teleological Proof. Here there is an advance, a beginning from existence as actually given and present. These proofs consequently form part of the finite determination of God. The Notion of God is that of something boundless, not boundless in the bad sense, but rather as representing what has at the same time the most determinate character possible, pure self-determination. These first proofs belong to the domain of finite connection, of finite determination, since we start with

what is given. Here, on the other hand, the starting-point is the free, pure Notion, and it is accordingly at this stage that we meet with the Ontological Proof of the existence of God. It constitutes the abstract metaphysical basis of this stage. It was first discovered in Christendom by Anselm of Canterbury. It was then further developed by all the later philosophers, by Descartes, Leibnitz, and Wolff, yet always along with the other proofs, though it alone is the true one. The Ontological Proof starts from the Notion. The Notion is considered to be something subjective, and is defined as something opposed to the object and to reality. Here it constitutes the starting-point, and what we have got to do is to show that Being, too, belongs to this Notion. The exact method of procedure is as follows. The Notion of God is first of all described, and it is shown that He cannot be conceived of unless as including Being in Himself. In so far as Being is separated from the Notion, God exists in a merely subjective way in our thought. As thus subjective He is imperfect, and imperfection belongs only to finite Spirit. It has to be shown that it is not only our notion which exists, but that He exists independent of our thinking. Anselm states the proof in the following simple form: God is what is most perfect, beyond which nothing can be thought of as existing; if God is merely an idea, then He is not what is most perfect. This, however, is in contradiction with the first statement; for we consider that as perfect which is not merely an idea, but which is also possessed of Being. If God is merely subjective, we could bring forward something higher which would be possessed of Being as well. This is further developed as follows. We begin with what is most perfect, and this is defined as the most real Essence, as the Substance of all realities. This has been termed possibility. The Notion as subjective, since it is distinguished from Being, is merely what is possible, or at all events it ought to be what is possible. According to the old Logic, possibility exists only where it can be shown that no contradiction exists. Realities are, in

accordance with this idea, to be considered as existing in God only in their affirmative aspect, as limitless, and in such a way that negation is supposed to be eliminated. But it is easy to prove that in this case all that is left is the abstraction of something which is one with itself. For when we speak of realities we mean to imply that they represent different characteristics, such as wisdom, righteousness, almighty power, omniscience. These characteristics are attributes which may easily be shown to be in contradiction with each other. Goodness is not righteousness; absolute power is in contradiction with wisdom; for this latter presupposes final-ends. Power, on the other hand, means the limitlessness of negation and production. If, as is demanded, the Notion is not to contradict itself, all determinateness must be dropped, for every judgment or difference advances to the state of opposition. God is the Substance of all realities, it is said, and since one of these is Being, Being is consequently united with the Notion. This proof maintained itself until recent times, and we find it worked out particularly in Mendelssohn's "Morning Hours." Spinoza defines the Notion or conception of God by saying that it is that which cannot be conceived of apart from Being. The finite is something whose existence does not correspond to the Notion. The species is realised in existing individuals, but these are transitory; the species is the Universal for itself. In the case of the finite, existence does not correspond to the Notion. On the other hand, in the case of the Infinite, which is determined within itself, the reality must correspond to the Notion; this is the Idea, the unity of subject and object. Kant criticised this proof, and the objections he urged against it were as follows. If God is defined as the Substance of all realities, then Being does not belong to Him, for Being is no reality. It makes no difference to the Notion or conception whether it exists or does not exist, it remains the same. Already in Anselm's day this objection was urged by a monk who said, "The fact of my forming an idea of anything does not

therefore imply that the thing exists.” Kant maintains that a hundred thalers really remain the same whether I merely form an idea of them or actually possess them; consequently Being is not a reality, or real predicate, since nothing is added by it to the Notion. It may be granted that Being is not any determinate content; all the same, nothing certainly should be added to the Notion. (We may remark in passing that to speak of every wretched form of existence as a notion is to go on quite wrong lines.) On the contrary, it should be rid of the defect attaching to it in that it is merely something subjective, and is not the Idea. The Notion which is only something subjective, and is divorced from Being, is a nullity. In the form of the proof as given by Anselm, the infinitude consists in the very fact that it is not one-sided, something purely subjective to which Being does not attach. The Understanding keeps Being and the Notion strictly apart, and considers each as self-identical. But even according to the ordinary idea the Notion apart from Being is considered one-sided and untrue, and so, too, Being in which there is no Notion is looked on as notionless Being, Being which is inconceivable. This antithesis which is found in finitude cannot have any place in connection with the Infinite or God.

But it is the following circumstance which makes the proof unsatisfactory. That most perfect and most real existence is in fact a presupposition measured by which Being for itself and the Notion for itself are one-sided. Descartes and Spinoza defined God as the cause of Himself. Notion and existence form an identity; in other words, God as Notion cannot be conceived of without Being. What is unsatisfactory in this view is that we have here a presupposition, and this means that the Notion measured by this standard of hypothetical necessity must be something subjective.

The finite and subjective, however, is not finite only as measured by the standard supplied by that presupposition. It is finite in itself, and is

consequently the antithesis of itself. It is the unsolved contradiction. Being is supposed to be distinct from the Notion. We may imagine we can regard this latter as strictly subjective, as finite; but the essential characteristic of Being is in the Notion itself. This finitude of subjectivity is done away with in the Notion itself, and the unity of Being and the Notion is not a presupposition relatively to the latter, and by which it is measured. Being in its immediacy is contingent, and we have seen that its truth is necessity. The Notion necessarily involves Being, and this is simple reference to self, the absence of mediation. If we consider the Notion, we find it to be that in which all difference is absorbed, and in which all determinations are merely ideal. This ideality is mediation or difference, which has been absorbed and removed, perfect clearness, pure transparency, being at home with self. The freedom of the Notion is just absolute reference to self, identity which is also immediacy, unity without mediation. The Notion thus has Being in itself potentially. Its very meaning is that it does away with its one-sidedness. The idea that Being can be separated from the Notion is a mere fancy. When Kant says that it is impossible to extract reality from the Notion, he is thinking of the Notion as something finite. But the finite is just what annuls itself; and if we were to think of the Notion in this way as divorced from Being, we should just have that very reference to self which Being essentially is.

The Notion, however, has not Being in itself potentially only. It is not seen to be there merely by us; but, on the contrary, the Notion is actual Being, Being for itself also. It abolishes its subjectivity, and objectifies itself. Man realises his ends; that is, what was, to begin with, merely ideal loses its one-sidedness, and is consequently made into something which has Being. The Notion shows itself eternally in that activity whereby Being is posited as identical with itself. In perception, feeling, &c., we have outward objects before us; but we take them up into ourselves, and thus the objects

are ideal in us. The Notion is thus the continuous act whereby it abolishes its difference. When we regard closely the nature of the Notion, we see that this identity with Being is no longer a presupposition, but a result. The course of procedure is as follows: the Notion makes itself objective, turns itself into reality, and is thus the truth, the unity of subject and object. God is an immortal living Being, says Plato, whose body and soul are united in one. Those who separate the two sides do not get beyond what is finite and untrue.

The standpoint which we here occupy is the Christian one. We have here the Notion of God in its entire freedom. This Notion is identical with Being. Being is the poorest of all abstractions; but the Notion is not so poor as not to contain this determination in it. We have not to deal with Being in the poverty of abstraction, in immediacy in its bad form, but with Being as the Being of God, as absolutely concrete Being, distinguished from God. The consciousness of finite Spirit is concrete Being, the material for the realisation of the Notion of God. Here it is not a question of any addition of Being to the Notion, or merely of a unity of the Notion and Being — such expressions are awkward and misleading. The unity is rather to be conceived of as an absolute process, as the living movement of God, and this means that the two sides are distinguished from each other, while the process is thought of as that absolute, continuous act of eternal self-production. Here we have the concrete and popular idea of God as Spirit. The Notion of Spirit is the Notion which has Being in-and-for-itself, that is to say, knowledge. This infinite Notion is negative reference to self. When thus posited it is judgment, the act of distinguishing, self-differentiation. But what is thus differentiated, and which at first appears as something outward, devoid of Spirit, outside of God, is really identical with the Notion. The development of this Idea is the absolute truth. In the Christian religion it is known that God has revealed Himself, and it is the very nature

of God to reveal Himself, and to reveal is to differentiate. What is revealed is just that God is the revealed God.

Religion must be something for all men; for those who have so purified their thought that they know what exists in the pure element of thought, and who have arrived at a philosophical knowledge of what God is, as well as for such as have not got beyond feeling and ordinary ideas.

Man is not merely pure thought. On the contrary, thought manifests itself as perception or picture-thought, or in the form of ordinary ideas. The absolute truth which is revealed to Man must therefore exist for him as a being who forms general ideas and sensuous images, who has feelings and sensations. This is the mark by which religion in general is distinguished from philosophy. Philosophy thinks what otherwise exists only for the ordinary idea and sensuous perception. Man who thus forms general ideas, is in his character as Man a thinking being also, and the substance of religion comes to him as a being who thinks. It is only a thinking being that can have a religion, and to think is also to form ideas, though the former act alone is the free form of truth. The Understanding thinks too, but it does not get beyond identity; for it the Notion is Notion, and Being is Being. These two one-sided categories always keep this one-sided form, so far as it is concerned. In their true nature, on the other hand, these finite forms are no longer held to be inherently identical on the ground that they are, but rather they are considered to be merely moments of a totality.

Those who find fault with philosophy for thinking religion, for stating religion in terms of thought, don’t know what they want. Hatred and vanity here come directly into play under the outward guise of humility. True humility consists in having the spirit absorbed in the truth, in losing ourselves in what is most inward, in having within us the object, and the object only. Thus anything subjective which may still be present in feeling, disappears. We have to consider the Idea from the purely speculative point

of view, and to justify its claims as against the Understanding, and against it as being hostile to all content of religion whatsoever. This content is called a mystery, because it is something hidden from the Understanding; for the latter does not get the length of the process which this unity is, and thus it is that everything speculative, everything philosophical, is for the Understanding a mystery.

The Criticism

Prolegomena to the Study of Hegel's Philosophy by William Wallace

CONTENTS

PREFACE

THE PRESENT VOLUME of Prolegomena completes the second edition of my LOGIC OF HEGEL which originally appeared in 1874. The translation, which was issued as a separate volume in the autumn of 1892, had been subjected to revision throughout: such faults as I could detect had been amended, and many changes made in the form of expression with the hope of rendering the interpretation clearer and more adequate. But, with a subject so abstruse and complicated as Hegel's Logic, and a style so abrupt and condensed as that adopted in his *Encyclopaedia*, a satisfactory translation can hardly fall within the range of possibilities. Only the enthusiasm of youth could have thrown itself upon such an enterprise; and later years have but to do what they may to fulfil the obligations of a task whose difficulties have come to seem nearly insuperable. The translation volume was introduced by a sketch of the growth of the *Encyclopaedia* through the three editions published in its author's lifetime: and an appendix of notes supplied some literary and historical elucidations of the text, with quotations bearing on the philosophical development between Kant and Hegel.

The Prolegomena, which have grown to more than twice their original extent, are two-thirds of them new matter. The lapse of twenty years could not but involve a change in the writer's attitude, at least in details, towards both facts and problems. The general purpose of the work, however, still remains the same, to supply an introduction to the study of Hegel, especially his *Logic,* and to philosophy in general. But, in the work of altering and inserting, I can hardly imagine that I have succeeded in adjusting the additions to the older work with that artful juncture which

would simulate the continuity of organic growth. To perform that feat would require a master who surveyed from an imperial outlook the whole system of Hegelianism in its history and meaning; and I at least do not profess such a mastery. Probably therefore a critical review will discern inequalities in the ground, and even discrepancies in the statement, of the several chapters. To remove these strains of inconsistency would in any case have been a work of time and trouble: and, after all, mere differences in depth or breadth of view may have their uses. The writer cannot always compel the reader to understand him, as he himself has not always the same faculty to penetrate and comprehend the problems he deals with. In these arduous paths of research it may well happen that the clearest and truest perceptions are not always those which communicate themselves with fullest persuasion and gift of insight. Schopenhauer has somewhere compared the structure of his philosophical work to the hundred-gated Thebes: so many, he says, are the points of access it offers for the pilgrims after truth to reach its central dogma. So — if one may parallel little things with his adventurous quest — even the less speculative chapters, and the less consecutive discourse, of these Prolegomena may prove helpful to some individual mood or phase of mind. If — as I suspect — the Second Book should elicit the complaint that the reader has been kept wandering too long and too deviously in the *Porches of Philosophy*, I will hope that sometimes in the course of these rovings he may come across a wicket-gate where he can enter, and — which is the main thing — gather truth fresh and fruitful for himself.

Fourteen chapters, viz. II, XXIV, and the group from VII to XVIII inclusive, are in this edition almost entirely new. Three chapters of the first edition, numbered XIX, XXII, XXIII, have been dropped. For the rest, Chaps. III-VI in the present correspond to Chaps. II-V in the first edition: Chap. XIX to parts of VII, VIII: Chaps. XX-XXIII to Chaps. IX-XII:

Chaps. XXV-XXX to Chaps. XIII-XVIII: and Chaps. XXXI, XXXII to Chaps. XX, XXI. But some of those nominally retained have been largely rewritten.

The new chapters present, amongst other things, a synopsis of the progress of thought in Germany during the half-century which is bisected by the year 1800, with some indication of the general conditions of the intellectual world, and with some reference to the interconnexion of speculation and actuality. Jacobi and Herder, Kant, Fichte, and Schelling have been especially brought under succinct review. In the first edition I did Kant less than justice. I have now, so far as my limits allowed, tried to rectify the impression; and even more perhaps, by a clear palinode, to tender my apology for the meagre and somewhat inappreciative notice I gave to the great names of Fichte and Schelling. For like reasons, and from a growing perception how much post-Kantian thought owed to the pre-Kantian thinkers, Spinoza and Leibniz have been partly brought within my range. If, furthermore, I may seem to have transgressed the due amount of allusions and comparisons drawn from Plato and Aristotle, Bacon and Mill, the excuse must be sought in that fixture of philosophical horizon which can hardly but creep on after a quarter of a century spent in teaching philosophy under the customs and ordinances of the Oxford School of Classical Philology.

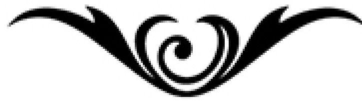
It would be to mistake the scope of this survey to seek in it a history of the philosophers of the period I have named. They have been presented, not in and for themselves, but as *momenta* or constituent! factors in producing Hegel's conception of the aim and method of philosophy. To do this it was necessary to lay stress on their inner purport and implications: to treat the individual thinker in subordination to the general movement of ideas: to give, as far as was possible, a constructive conception of them rather than an analysis and chronicle. Yet as the picture had to be done, so to say, with a

few vigorous touches, and made characteristic rather than descriptive, it cannot have that fairness and completeness which only patient study of every feature and untiring experiment in reconstruction can enable even the artist to produce. I may have seemed to confine the environment too exclusively to continental thinkers: but this is not, I think, due to any anti-patriotic bias. English (by which term, I may explain to my countrymen, I mean English-writing) thought, if it has its own intrinsic value, has after all been only an occasional influence, of suggestion and modification, in Germany. It is not therefore an integral portion of my theme. Even in Kant's case, too much may be made of the stimulus he received from Hume.

Even twenty years ago, my translation could hardly be described literally as a voice crying in the wilderness. But since that time there has been a considerable out-put of history, translation, and criticism referring to the great age of German philosophy, and a comparatively numerous group of writers, more or less familiar with the aims and principles of that period, have treated various parts of philosophy with notable independence and originality. To these writers it has sometimes been found convenient to give the title of Neo-Kantians, or Neo-Hegelians. The prefix suggests that they do not in all points reproduce the ideal or the caricature which vulgar tradition fancied, and perhaps still fancies, to be implied in German 'transcendentalism.' And that for the good reason that the springs of the movement lie in the natural and national revulsion of English habits of mind. Slowly, but at length, the storms of the great European revolution found their way to our intellectual world, and shook church and state, society and literature. The homeless spirit of the age had to reconsider the task of rebuilding its house of life. It may have been that some of the seekers, in the fervour of a first impression, spoke unadvisedly, as if salvation could and would come to English philosophy only by Kant and Hegel. Yet, there was a real foundation for the belief that the insularity —

however necessary in its season, and however admirable in some of its results — which had secluded and narrowed the British mind since the middle of the eighteenth century, needed something deeper and stronger than French 'ideology' to bring it abreast of the requirements of the age. Whatever may be the drawbacks of transcendentalism, they are virtues when set beside the vulgar ideals of enlightenment by superficialisation. Mill has well pointed out how the spirit of Coleridge was for the higher intellectual life a needful complement to the spirit of Bentham. Yet the spirit of Coleridge had but caught some of the side-lights and romantic illuminations: it had not dared to face the central sun either in literature or philosophy. The scholar who has given us excellent versions of Fichte's lighter works, those who have translated and expounded Kant, and the great author who opened German literature to the British public, have brought us nearer the higher teaching of Germany. In Germany itself it has always been the possession only of the few. Even at the height of the classical period there were litterateurs who vended thousands of their books for Goethe's hundreds, and the great philosophers had ten opponents to one follower even amongst the teachers of their day. Yet Goethe and not Kotzebue gave the permanent law to literature; Hegel, and not Krug or Fries, has influenced philosophy. To have had the resolution to learn in this school is the merit of 'Neo-Hegelianism.' It has probably not found Kant free from puzzles and contradictions, or Hegel always intelligible. But the example of the Germans has served to widen and deepen our ideas of philosophy: to make us think more highly of its function, and to realise that it is essentially science, and the science of supreme reality. And it has at least familiarised many with the heresy that dilettantism and occasional fits of speculativeness are worth as little in philosophy as elsewhere. To have striven for dignity in its scope, and scientific security in its method, is something. If the Neo-Hegelian has not given philosophy a settled language, it may be urged that a

philosophical language cannot be created by the easy device of inventing a few Hellenistic-seeming vocables.



I could have wished to make these volumes a worthier contribution to the work whereby these and other writers have recently enriched our island philosophy. Not least because of the honoured name I have ventured to write on the dedication-page. If, as Epicurus said, we should above all be grateful to the past, the first meed is from the scholar due to the teachers of earlier years, and not least those who have now entered into their rest. I do not forget what I, and others, owed to T. H. Green, my predecessor in the Chair of Moral Philosophy; that example of high-souled devotion to truth, and of earnest and intrepid thinking on the deep things of eternity. But at this season the memory of my Oxford tutor and friend is naturally most prominent. The late Master of Balliol College was more than a mere scholar or a mere philosopher. He seemed so idealist and yet so practical: so realist and yet so full of high ideals: so delicately kind and yet so severely reasonable. You felt he saw life more steadily and saw it more whole than others: as one reality in which religion and philosophy, art and business, the sciences and theology, were severally but elements and aspects. To the amateurs of novelty, to the slaves of specialisation, to the devotees of any narrow way, such largeness might, with the impatience natural to limited minds, have seemed indifference. So must appear those who on higher planes hear all the parts in the harmony of humanity, and with the justice of a wise love maintain an intellectual *Sôprosyné*. On his pupils this secret power of an other-world serenity laid an irresistible spell, and bore in upon them the conviction that beyond scholarship and logic there was the fuller truth of life and the all-embracing duty of doing their best to fulfil the amplest requirements of their place.

In earlier days Jowett had been keenly interested in German philosophy, and had made a version (most of which was still extant in 1868) of the

Logic I have translated. But Greek literature, and above all Plato, drew him to more congenial fields. It was on his suggestion, — or shall I say injunction — at that date, that the work I had casually begun was some years later prosecuted to completion. It was his words, again, two years ago, that bade me spare no labour in the work of revision.

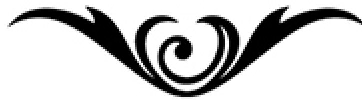
December, 1893.

FROM THE PREFACE TO THE FIRST EDITION

THE 'LOGIC OF Hegel' is a name which may be given to two separate books. One of these is the 'Science of Logic' (Wissenschaft der Logik), first published in three volumes (1812-1816), while its author was schoolmaster at Nüremberg. A second edition was on its way, when Hegel was suddenly cut off, after revising the first volume only. In the 'Secret of Hegel,' the earlier part of this Logic has been translated by Dr. Hutchison Stirling, with whose name German philosophy is chiefly associated in this country.

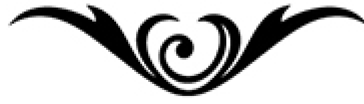
The other Logic, of which the present work is a translation, forms the First Part in the 'Encyclopaedia of the Philosophical Sciences.' The first edition of the Encyclopaedia appeared at Heidelberg in 1817; the second in 1827; and the third in 1830. It is well to bear in mind that these dates take us back forty or fifty years, to a time when modern science and Inductive Logic had yet to win their laurels, and when the world was in many ways different from what it is now. The earliest edition of the Encyclopaedia contained the pith of the system. The subsequent editions brought some new materials, mainly intended to smooth over and explain the transitions between the various sections, and to answer the objections of critics. The work contained a synopsis of philosophy in the form of paragraphs, and was to be supplemented by the *viva voce* remarks of the lecturer.

The present volume is translated from the edition of 1843, forming the Sixth Volume in Hegel's Collected Works. It consists of two nearly equal portions. One halt here printed in more open type, contains Hegel's Encyclopaedia, with all the author's own additions. The first paragraph under each number marks the earliest and simplest statement of the first edition. The other half, here printed in closer type, is made up of the notes



taken in lecture by the editor (Henning) and by Professors Hotho and Michelet. These notes for the most part connect the several sections, rather than explain their statements. Their genuineness is vouched for by their being almost verbally the same with other parts of Hegel's own writings.

The translation has tried to keep as closely as possible to the meaning, without always adhering very rigorously to the words of the original. It is, however, much more literal in the later and systematic part, than in the earlier chapters.



The Prolegomena which precede the translation have not been given in the hope or with the intention of expounding the Hegelian system. They merely seek to remove certain obstacles, and to render Hegel less tantalizingly hard to those who approach him for the first time. How far they will accomplish this, remains to be seen.

BOOK I. OUTLOOKS AND APPROACHES TO HEGEL

CHAPTER I. WHY HEGEL IS HARD TO UNDERSTAND.

'THE CONDEMNATION,' SAYS Hegel, 'which a great man lays upon the world, is to force it to explain him[1].' The greatness of Hegel, if it be measured by this standard, must be something far above common. Interpreters of his system have contradicted each other, almost as variously as the several commentators on the Bible. He is claimed as their head by widely different schools of thought, all of which appeal to him as the original source of their line of argument. The Right wing, and the Left, as well as the Centre, profess to be the genuine descendants of the prophet, and to inherit the mantle of his inspiration. If we believe one side, Hegel is only to be rightly appreciated when we divest his teaching of every shred of religion and orthodoxy which it retains. If we believe another class of expositors, he was the champion of Christianity.

These contradictory views may be safely left to abolish each other. But diversity of opinion on such topics is neither unnatural, nor unusual. The meaning and the bearings of a great event, or a great character, or a great work of reasoned thought, will be estimated and explained in different ways, according to the effect they produce on different minds and different levels of life and society. Those effects, perhaps, will not present themselves in their true character, until long after the original excitement has passed away. To some minds, the chief value of the Hegelian system will lie in its vindication of the truths of natural and revealed religion, and in the agreement of the elaborate reasonings of the philosopher with the simple aspirations of mankind towards higher things. To others that system will have most interest as a philosophical history of thought, — an exposition of that organic development of reason, which underlies and

constitutes all the varied and complex movement of the world. To a third class, again, it may seem at best an instrument or method of investigation, stating the true law by which knowledge proceeds in its endeavour to comprehend and assimilate existing nature.

While these various meanings may be given to the Hegelian scheme of thought, the majority of the world either pronounce Hegel to be altogether unintelligible, or banish him to the limbo of *a priori* thinkers, — that bourne from which no philosopher returns. To argue with those who start from the latter conviction would be an ungrateful, and probably a superfluous task. Wisdom is justified, we may be sure, of all her children. But it may be possible to admit the existence of difficulties, and agree to some extent with those who complain that Hegel is impenetrable and hard as adamant. There can be no doubt of the forbidding aspect of the most prominent features in his system. He is hard in himself, and his readers find him hard. His style is not of the best, and to foreign eyes seems unequal. At times he is eloquent, stirring, and striking: again his turns are harsh, and his clauses tiresome to disentangle: and we are always coming upon that childlikeness of literary manner, which English taste fancies it can detect in some of the greatest works of German genius; There are faults in Hegel, which obscure his meaning: but more obstacles are due to the nature of the work, and the pre-occupations of our minds. There is something in him which fascinates the thinker, and which inspires a sympathetic student with the vigour and the hopefulness of the spring-time.

Perhaps the main hindrance in the way of a clear vision is the contrast which Hegelian philosophy offers to our ordinary habits of mind. Generally speaking, we rest contented if we can get tolerably near our object, and form a general picture of it to set before ourselves. It might almost be said that we have never thought of such a thing as being in earnest either with our words or with our thoughts. We get into a way of speaking with an

uncertain latitude of meaning, and leave a good deal to the fellow-feeling of our hearers, who are expected to mend what is defective in our utterances. For most of us the place of exact thought is supplied by metaphors and pictures, by mental images, and figures generalised from the senses. And thus it happens that, when we come upon a single precise and definite statement, neither exceeding nor falling short in its meaning, we are thrown out of our reckoning. Our fancy and memory have nothing left for them to do: and, as fancy and memory make up the greater part of what we loosely call thinking, our powers of thought seem to be brought to a standstill. Those who crave for fluent reading, or prefer easy writing, something within the pale of our usual mental lines, are more likely to find what they seek in the ten partially correct and approximate ways commonly used to give expression to a truth, than in the one simple and accurate statement of the thought. We prefer a familiar name, and an accustomed image, on which our faculties may work. But in the atmosphere of Hegelian thought, we feel very much as if we had been lifted into a vacuum, where we cannot breathe, and which is a fit habitation for unrecognisable ghosts only.

Nor is this all. The traveller, as his train climbs the heights of Alps or Apennines, occasionally, after circling in grand curve upon the mountain-side, and perhaps after having been dragged mysterious distances through the gloom of a tunnel, finds himself as it would seem back at the same place as he looked forth from some minutes before; and it is only after a brief comparison that he realises he now commands a wider view from a point some hundreds of feet higher. So the student of Hegel — (and it might be the case with Fichte also) as the machinery of the dialectical method, with its thesis, antithesis, and synthesis, carries him round and round from term to term of thought — like the *Logos* and the Spirit, which blow us whithersoever they list — begins to suffer from dizziness at the apprehension that he has been the victim of phantasmagoria and has not

really moved at all. It is only later — if ever — that he recognises that the scene, though similar, is yet not altogether the same. It is only later — if ever — that he understands that the path of philosophy is no wandering from land to land more remote in search of a lost Absolute, a vanished God; no setting forth of new and strange facts, of new Gods, but the revelation in fuller and fuller truth of the immanent reality in whom we live, and move, and have our being, — the manifestation in more closely-knit unity and more amply-detailed significance of that Infinite and Eternal, which was always present among us, though we saw but few, perhaps even no, traces of its power and glory.

To read Hegel often reminds us of the process we have to go through in trying to answer a riddle. The terms of the problem to be solved are all given to us: the features of the object are, it may be, fully described: and yet somehow we cannot at once tell what it is all about, or add up the sum of which we have the several items. We are waiting to learn the subject of the proposition, of which all these statements may be regarded as the predicates. Something, we feel, has undoubtedly been said: but we are at a loss to see what it has been said about. Our mind wanders round from one familiar object to another, and tries them in succession to see whether any one satisfies the several points in the statement and includes them all. We grope here and there for something we are acquainted with, in which the bits of the description may cohere, and get a unity which they cannot give themselves. When once we have hit upon the right object, our troubles are at an end: and the empty medium is now peopled with a creature of our imagination. We have reached a fixed point in the range of our conception, around which the given features may cluster.

All this trouble caused by the Hegelian theory of what philosophy involves — viz. really beginning at the beginning, is saved by a device well

known to the several branches of Science. It is the way with them to assume that the student has a rough general image of the objects which they examine; and under the guidance, or with the help of this generalised image, they go on to explain and describe its outlines more completely. They start with an approximate conception, such as anybody may be supposed to have; and this they seek to render more definite. The geologist, for example, could scarcely teach geology', unless he could pre-suppose or produce some acquaintance on the part of his pupils with what Hume would have called an 'impression' or an 'idea' of the rocks and formations of which he has to treat. The geometer gives a short, and, as it were, popular explanation of the sense in which angles, circles, triangles, &c. are to be understood: and then by the aid of these provisional definitions we come to a more scientific notion of the same terms. The third book of Euclid, for example, brings before us a clearer notion of what a circle is, than the nominal explanation in the list of definitions. By means of these temporary aids, or, as we may call them, leading-strings for the intellect, the progress of the ordinary scientific student is made tolerably easy. But v in philosophy, as it is found in Hegel, there is quite another way of working. The helps in question are absent: and until it be seen that they are not even needed, the Hegelian theory will remain a sealed mystery. For that which the first glance seemed to show as an enigma, is only the plain and unambiguous statement of thought. Instead of casting around for images and accustomed names, we have only to accept the several terms and articles in the development of thought as they present themselves. These terms merely require to be apprehended. They stand in no immediate need of illustration from our experience. What we have to bring to the work, is patience, self-restraint, the sacrifice of our cherished habits of mind, the surrender of the natural wish to see at once what it all comes to, what it is good for, how it squares with other convictions. As Bacon reminded his age, Into the

kingdom of philosophy, as into the kingdom of heaven, none can enter, *nisi sub persona infantis*: i. e. unless he at least steadfastly resolve to renounce that world which lieth in the Evil.

Ordinary knowledge consists in referring a new object to a class of objects, that is to say, to a generalised image with which we are already acquainted. It is not so much cognition as re-cognition. '"What is the truth?"' asked Lady Chettam of Mrs. Cadwallader in *Middle-march*. "The truth? he is as bad as the wrong physic — nasty to take, and sure to disagree." "There could not be anything worse than that," said Lady Chettam, with so vivid a conception of the physic that she seemed to have learned something exact about Mr. Casaubon's 'disadvantages.' Once we have referred the new individual to a familiar category or a convenient metaphor, once we have given it a name, and introduced it into the society of our mental drawing-room, we are satisfied. We have put a fresh object in its appropriate drawer in the cabinet of our ideas: and hence, with the pride of a collector, we can calmly call it our own. But such acquaintance, proceeding from a mingling of memory and naming, is not the same thing as knowledge in the strict sense of the term.[2] 'What is he?' 'Do you know him?' These are our questions: and we are satisfied when we learn his name and his calling. We may never have penetrated into the inner nature of those objects, with whose *tout ensemble,* or rough outlines, we are so much at home, that we fancy ourselves thoroughly cognisant of them. Classifications are only the first steps in science: and we do not understand a thought because we can view it under the guise of some of its illustrations.

In the case of the English reader of Hegel some peculiar hindrances spring from the foreign language. In strong contrast to most of the well-known German philosophers, he may be said to write in the popular and national dialect of his country. Of course there are tones and shades of meaning given to his words by the general context of his system. But upon

the whole he did what he promised to J. H. Voss — the translator of Homer, and the poet of the *Luise,* in a letter written from Jena in 1805. He there says of his projects: ‘Luther has made the Bible, and you have made Homer speak German. No greater gift than this could be given to the nation. So long as a nation is not acquainted with a noble work in its own language, it is still barbarian, and does not regard the work as its own. Forget these two examples, and I may describe my own efforts as an attempt to teach philosophy to speak in German.[3]

Yet, in this matter of nationalising or Germanising philosophy, he only carried a step further what Wolff and even Kant had begun; just as, on the other hand, he falls a long way short of what K. C. F. Krause, his contemporary, attempted in the same direction. Such an attempt, by its very nature, could never command a popular success. It runs directly counter to that tendency already noted, to escape the requirement to think and think for ourselves, by taking refuge under the shadow of a familiar term, which conceals in its apparent simplicity a great complex of ill-apprehended elements. The ordinary mind — and the more readily perhaps the more vulgar it is — flees for ease and safety to a cosmopolitan term, to the denationalised vocable of learned origin, to the language of general European culture. To such an ordinary mind — and up at least to a certain extent we all at times come under that heading — the effort to remain in the pellucid air of our unadulterated mother-tongue is too embarrassing to be long continued. Nor, after all, is it more than partially practicable. The well of German undefiled is apt to run dry. Hegel himself never shrinks when it is needful to appropriate non-Teutonic words, and is in the habit of employing the synonymous terms of native and of classical origin with a systematic difference of meaning [4]

Hegel is unquestionably *par excellence* the philosopher of Germany, — German through and through. For philosophy, though the common

birthright of full-grown reason in all ages and countries, must like other universal and cosmopolitan interests, such as the State, the Arts, or the Church, submit to the limits and peculiarities imposed upon it by the natural divisions of race and language. The subtler *nuances*, as well as the coarser differences of national speech, make themselves vividly felt in the systems of philosophy, and defy translation. If Greek philosophy cannot, no more can German philosophy be turned into a body of English thought by a stroke of the translator's pen. There is a difference in this matter, a difference at least in degree, between the special sciences and philosophy. The several sciences have a de-nationalised and cosmopolitan character, like the trades and industries of various nations; they are pretty much the same in one country and another, especially when we consider the details, and neglect the general subdivisions. But in the political body, in the works of high art, and in the systems of philosophy, the whole of the character and temperament of the several peoples finds its expression, and stands distinctly marked, in a shape of its own. If the form of German polity be not transferable to this side of the Channel, no more will German philosophy. Direct utilisation for English purposes is out of the question: the circumstances are too different. But the study of the great works of foreign thought is not on that account useless, any more than the study of the great works of foreign statesmanship.

Hegel did good service, at least, by freeing philosophy from that aspect of an imported luxury, which it usually had, — as if it were an exotic plant removed from the bright air of Greece into the melancholy mists of Western Europe. 'We have still,' he says, 'to break down the partition between the language of philosophy, and that of ordinary consciousness: we have to overcome the reluctance against thinking what we are familiar with[5].' Philosophy must be brought face to face with ordinary life, so as to draw its strength from the actual and living present, and not from the memories or

traditions of the past. It has to become the organised and completed thinking of what is contained blindly and vaguely in the various levels of popular intelligence, as these are more or less educated and ordered. It must grow naturally, as in ancient Greece, from the necessities of the social situation, and not be a product of artificial introduction and nurture: the revelation by the mind's own energy of an implicit truth, not the communication of a mystery sacramentally received. To suppose that a mere change of words can give this grace, would be absurd. Yet where the national life pulses strong, as that of Germany in those days did at first in letters and then in social reform, the dominant note will make itself felt even in the neutral regions of speculation. It was a step on the right road to banish a pompous and aristocratic dialect from philosophy, and to lead it back to those words and forms of speech, which are at least in silent harmony with the national feeling.

[2] 'Das Bekannte überhaupt ist darum, weil es bekannt ist, nicht erkannt.' *Phenomenologie des Geistes,* p. 24.

[3] *Vermischte Schriften,* vol. ii. p. 474.

[4] e. g. *Dasein* and *Existenz: Wirklichkeit* and *Realität*: *Wesen* and *Substanz.* It is the same habit of curiously pondering over the tones and shades of language which leads him to something very like playing on words, and to etymologising, as one may call it, on unetymological principles: e. g. the play on *Mein* and *Meinung* (vol. ii. 32: cf. *Werke*, ii. 75): the literal rendering of *Erinnerung* (*Encycl.* §§ 234 and 450); and the abrupt transitions, as it would seem, from literal to figurative use of such a term as *Grund.* At the same time it is well not to be prosaically certain that a free play of thought does not follow the apparently fortuitous assonance of words.

CHAPTER II. WHY TRANSLATE HEGEL?

'BUT,' IT IS urged, 'though it be well to let the stream of foreign thought irrigate some of our philosophical pastures, though we should not for ever entrench ourselves in our insularity — why try to introduce Hegel, of all philosophers confessedly the most obscure? Why not be content with the study and the "exploitation" of Kant, whom Germans themselves still think so important as to expound him with endless comment and criticism, and who has at length found, after some skirmishes, a recognised place in the English philosophical curriculum? Why seek for more Teutonic thinking that can be found in Schopenhauer, and found there in a clear and noble style, luminous in the highest degree, and touching with no merely academic abstruseness the problems of life and death? Or — as that song is sweetest to men which is the newest to ring in their ears — why not render accessible to English readers the numerous and suggestive works of Eduard von Hartmann, and of Friedrich Nietzsche — not to mention Robert Hamerling[1]? Or, finally, why not give us more and ever more translations of the works in logic, ethics, psychology, or metaphysics, of those many admirable teachers in the German universities, whom it would be invidious to try to single out by name? As for Hegel, his system, in the native land of the philosopher, is utterly discredited; its influence is extinct; it is dead as a door-nail. It is a pity to waste labour and distract attention, and that in English lands, where there are plenty of problems of our own to solve, by an attempt, which must perforce be futile, to resuscitate these defunctitudes?'

That Hegelianism has been utterly discredited, in certain quarters, is no discovery reserved for these later days. But on this matter perhaps we may

borrow an analogy. If the reader will be at the trouble to take up two English newspapers of opposite partisanship and compare the reports from their foreign correspondents on some question of home politics, he may, if a novice, be surprised to learn that according to one, the opinion e. g. of Vienna is wholly adverse to the measure, while, according to the other, that opinion entirely approves.

It is no new thing to find Hegelianism in general obloquy. Even in 1830 the Catholic philosopher and theologian Günther[2] — an admirer, but by no means a follower of Hegel — wrote that, 'for some years it had been the fashion in learned Germany to look upon philosophy, and above all Hegelian philosophy, as a door-mat on which everybody cleaned his muddy boots before entering the sanctuary of politics and religion.' What is true as regards the alleged surcease of Hegelianism is that in the reaction which from various causes turned itself against philosophy in the two decennia after 1848, that system, as the most deeply committed part of the 'metaphysical' host, suffered most severely. History and science seemed to triumph along the whole line. But it may be perhaps permissible to remark that Hegelianism had predicted for itself the fate that it proved had fallen on all other philosophies. After the age of Idealism comes the turn of Realism. The Idea had to die — had to sink as a germ in the fields of nature and history before it could bear its fruit. Above all it is not to be expected that such a system, so ambitious in aim and concentrated in expression, could find immediate response and at once disclose all its meaning. His first disciples are not the — truest interpreters of any great teacher. What he saw in the one comprehensive glance of genius, his successors must often be content to gather by the slow accumulation of years, and perhaps centuries, of experience. It is not to Theophrastus that we go for the truest and fullest conception of Aristotelianism; nor is Plato to be measured by what his immediate successors in the Academy managed to make out of him. It is

now more than a century since Kant gave his lesson to the public, and we are still trying to get him focussed in a single view: it may be even longer till Hegel comes fully within the range of our historians of thought. Aristotelianism too had to wait centuries till it fully entered the consciousness even of the thinking world.

It is to be said too that without Hegel it would be difficult to imagine what even teachers, like Lotze, who were very unlike him, would have had to say. It does not need a very wide soul, nor need one be a mere dilettantist eclectic, to find much of Schopenhauer's work far from incompatible with his great, and as some have said, complementary opposite. It is not indeed prudent as yet for a writer in Germany who wishes to catch the general ear to affix too openly a profession of Hegelian principles, and he will do well to ward off suspicion by some disparaging remarks on the fantastic methods, the overfondness for system, the contempt for common sense and scientific results which, as he declares, vitiate all the speculations of the period from 1794 to 1830. But under the names of Spinoza and of Leibniz the leaven of Hegelian principles has been at work: and if the Philistines solve the riddle of the intellectual Samson, it is because they have ploughed with his heifer, — because his ideas are part of the modern stock of thought, — not from what they literally read in the great thinkers at the close of the seventeenth century. Last year saw appear in Germany two excellent treatises describable as popular introductions to philosophy[3], one by a thinker who has never disguised his obligations to Hegel, the other by a teacher in the University of Berlin who may in many ways be considered as essentially kindred with our general English style of thought. But both treatises are more allied in character to the spirit of the Hegelian attempts to comprehend man and God than to the formalistic and philological disquisitions which have for some years formed the staple of German professorial activity. And, lastly, the vigorous thinker, who a quarter of a

century ago startled the reading public by the portent of a new metaphysic which should be the synthesis of Schelling and Schopenhauer, has lately informed us[4] that his affinity to Hegel is, taken all in all, greater than his affinity to any other philosopher'; and that that affinity extends to all that in Hegel has essential and permanent value.

But it is not on Eduard von Hartmann's commendation that we need rest our estimate of Hegelianism. We shall rather say that, till more of Hegel has been assimilated, he must still block the way. Things have altered greatly in the last twenty years, it is true; and ideas of more or less Hegelian origin have taken their place in the common stock of philosophic commodities. But it will probably be admitted by those best qualified to speak on the subject, that the shower has not as yet penetrated very deeply into the case-hardened soil, still less saturated it in the measure most likely to cause fruitful shoots to grow forth. We have to go back to Hegel in the same spirit as we go to Kant, and, for that matter, to Plato or Descartes: or, as the moderns may go back — to borrow from another sphere — to Dante or Shakespeare. We do not want the modern poet to resuscitate the style and matter of *King Lear* or of the *Inferno.* Yet as the Greek tragedian steeped his soul in the language and the legend of Homeric epic, as Dante nurtured his spirit on the noble melodies of Mantua's poet; so philosophy, if it is to go forth strong and effective, must mould into its own substance the living thought of former times. It would be as absurd, and as impossible to be literally and simply a Hegelian, — if that means one for whom Hegel sums up all philosophy and all truth — as it is to be at the present day in the literal sense a Platonist or an Aristotelian. The world may be slow, the world of opinion and thought may linger: *e pur si muove.* We too have our own problems — the same, no doubt, in a sense, from age to age, and yet infinitely varying and never in two ages alike. New stars have appeared on the spiritual sky; and whether they have in them the eternal light or only the

flash and glare of a passing meteor, they alter the aspects of the night in which we are still waiting for the dawn.

A new language, born of new relations of ideas, or of new ideas, is perforce for our generation the vehicle of all utterances, and we cannot again speak the dialect, however imposing or however quaint, of a vanished day.

And for that reason there must always be a new philosophy, couched in the language of the age, sympathetic with its hopes and fears, conscious of its beliefs, more or less sensible of its problems — as indeed we may be confident there always will be. But, perhaps, the warrior in that battle against illusion and prejudice, against the sloth which takes things as they are and the poorness of spirit which is satisfied with first appearances, will not do wisely to disdain the past. He will not indeed equip himself with rusty swords and clumsy artillery from the old arsenals. But he will not disdain the lessons of the past, — its methods and principles of tactics and strategy. Recognising perhaps some defects and inequalities in the methods and aims of thought most familiar to him and current in his vicinity, he may go abroad for other samples, even though they be not in all respects worth his adoption. And so without taking Hegel as omniscient, or pledging himself to every word of the master, he may think from his own experience that there is much in the system that will be helpful, when duly estimated and assimilated, to others. There is — and few can be so bigoted or so positive-minded as to regret it — there is unquestionably a growing interest in English-speaking countries in what may be roughly called philosophy — the attempt, unprejudiced by political, scientific, or ecclesiastical dogma, to solve the questions as to what the world really is, and what man’s place and function is. ‘The burthen of the mystery, the heavy and the weary weight of all this unintelligible world’ is felt — felt widely and sometimes felt deeply.

To the direct lightening of that burthen and that mystery it is the privilege of our profoundest thinkers and our far-seeing poets and artists to contribute. To the translator of Hegel there falls the humbler task of making accessible, if it may be, something of one of the later attempts at a solution of the enigma of life and existence, — an attempt which for a time dazzled some of the keenest intellects of its age, and which has at least impressed many others with the conviction, born of momentary flashes from it of vast illuminant power, that — *si sic omnia* — there was here concealed a key to many puzzles, and a guard against many illusions likely to beset the inquirer after truth.

CHAPTER III. ENGLISH PHILOSOPHY AND HEGEL.

ALTHOUGH WE NEED not take too seriously Hegel's remark (vol. ii. p. 13) on the English conception of philosophy, it may be admitted that, by the dominant school of English thought, philosophy, taken in the wide sense it has predominantly born abroad, was, not so very long ago, all but entirely ignored. Causes of various kinds had turned the energy of the English mind into other directions, not less essential to the common welfare. Practical needs and an established social system helped — to bind down studies to definite and particular objects, and to exclude what seemed vague and general investigations with no immediate bearing on the business of life. Hence philosophy in England could hardly exist except when it was reduced to the level of a special branch of science, or when it could be used as a receptacle for the principles and methods common to all the sciences. The general term was often used to denote the wisdom of this world, or the practical exhibition of self-control in life and action. For those researches, which are directed to the objects once considered proper to philosophy, the more definite and characteristic term came to be Mental and Moral Science.

The old name was in certain circles restricted to denote the vague and irregular speculations of those thinkers, who either lived before the rise of exact science, or who acted in defiance of its precepts and its example. One large and influential class of English thinkers inclined to sweep philosophy altogether away, as equivalent to metaphysics and obsolete forms of error; and upon the empty site thus obtained they sought to construct a psychological theory of mind, or they tried to arrange and codify those general remarks upon the general procedure of the sciences which are known under the name of Inductive Logic. A smaller, but not less vigorous,

school of philosophy looked upon their business as an extension and rounding off of science into a complete unification of knowledge. The first is illustrated by the names of J. S. Mill and Mr. Bain: the second is the doctrine of Mr. Herbert Spencer.

The encyclopaedic aggregate of biological, psychological, ethical and social investigation which Mr. Spencer pursues, under the general guidance of the formula of evolution by differentiation and integration, still proceeds on its course: but though its popularity — as such popularity goes — is vast and more than national, it does not and probably cannot find many imitators. Very differently stand matters with the movement in psychology and logic. Here the initiative has led to divergent and unexpected developments. Psychology, which at first was partly an ampler and a more progressive logic, a theory of the origin and nature of knowledge, partly a propaedeutic to the more technical logic and ethics, and pursued in a loosely introspective way, has gravitated more and more towards its experimental and physiological side, with occasional velleities to assume the abstractly-mathematical character of a psycho-physical science. Logic, on the other hand, has also changed its scope. Not content to be a mere tool of the sciences or a mere criterion for the estimation of evidence, it has in one direction grown into a systematic effort to become an epistemology — a system of the first principles of knowledge and reality — a metaphysic of science; and in another it has sought to realise the meaning of those old forms of inference which the logicians of half a century ago were inclined to pooh-pooh as obsolete. Most remarkable — and most novel of all — is the vast increase of interest and research in the problems of ethics and v of what is called the philosophy of religion — subjects which at that date were literally burning questions, apt to scorch the fingers of those who touched them. In all of this, but especially marked in some leading thinkers, the ruling feature is the critical — the sceptical, i. e. the eager, watchful, but

self-restrained — attitude towards its themes. Ever driving on to find a deeper unity than shows on the surface, and to get at principles, the modern thinker — and in this we see the permanent and almost overwhelming influence of Kant upon him — recoils from the dogmatism of system, at the very moment it seems to be within his grasp.

Thus the recent products of English thought have been, as Mr. Spencer has taught us to say, partly in the line of differentiation, partly of integration. At one moment it seems as if the ancient queen of the sciences sat like Hecuba, *exul, inops,* while her younger daughters enjoyed the freedom and progress of specialisation. The wood seems lost behind the trees. And at another, again, the centripetal force seems to preponderate: every department, logic, ethics, psychology, sociology, rapidly carries its students on and up to fundamental questions, if not to fundamental principles. Philosophy — the one and undivided truth and quest of truths — emerges fresh, vigorous, and as yet rather indeterminate, from the mass of detailed investigations. That the position is now altered from what it was in times when knowledge had fewer departments, is obvious. The task of the 'synoptic' mind — which Plato claims for the philosopher — grows increasingly difficult: but that is hardly a reason for performing it in a more perfunctory way. It seems rather as if in such a crisis one of the great reconstructive systems of a preceding age might be in some measure helpful.

If we consult history, it is at once clear that philosophy, or the pursuit of ultimate reality and permanent truth, went hand in hand with scientific researches into facts and their particular explanations.

In their earlier stages the two tendencies of thought were scarcely distinguishable. The philosophers of Ionia and Magna Graecia were also the scientific pioneers of their time. Their fragmentary remains remind us at times of the modern theories of geology and biology, — at other times of

the teachings of idealism. The same thing is comparatively true of the earlier philosophers of Modern Europe. The seventeenth and eighteenth centuries, in spite of Bacon and Newton, endeavoured to study the mental and moral life by a method which was a strange mixture of empiricism and metaphysics. In words, indeed, the thinkers from Descartes to Wolff duly emphasise, perhaps over-emphasise, the antithesis between the extended and the intellectual. But in practice their course is not so clear. Their mental philosophy is often only a preliminary *medicina mentis* to set the individual mind in good order for undertaking the various tasks awaiting a special research. They are really eager to get on to business, and only, as it were, with regret spend time in this clearance of mental faculty. And when they do deal with objects, the material and extended tends to become the dominant conception, the basis of reality. The human mind, that *nobilissima substantia*, is treated only as an aggregate, or a receptacle, of ideas, and the *mens*, — with them all nearly as with Spinoza, — is only an *idea corporis,* and that phrase not taken so highly as Spinoza's perhaps should be taken. In the works of these thinkers, as of the pre-Socratics, there is one element which may be styled philosophical, and another element which maybe styled scientific, — if we use both words vaguely. But with Socrates in the ancient, and with Kant in the modern epoch of philosophy, an attempt was made to get the boundary between the two regions definitively drawn. The distinction was in the first place accompanied by something like turning the back upon science and popular conceptions. Socrates withdrew thought from disquisitions concerning the nature of all things, and fixed it upon man and the state of man. Kant left the broad fields of actually-attained knowledge, and inquired into the central principle on which the acquisition of science, the laws of human life, and the ideals of art and religion, were founded.

The change thus begun was not unlike that which Copernicus effected in the theory of Astronomy. Human personality, either in the actualised forms of the State, or in the abstract shape of the Reason, — that intellectual liberty, which is a man's true world, — was, at least by implication, made the pivot around which the system of the sciences might turn. In the contest, which according to Reid prevails between Common Sense and Philosophy, the presumptions of the former have been distinctly reversed, and Kant, like Socrates, has shown that it is not the several items of fact, but the humanity, the moral law, the thought, which underlies these doctrines, which give the real resting-point and true centre of movement. But this negative attitude of philosophy to the sciences is only the beginning, needed to secure a standing-ground. In the ancient world Aristotle, and in the modern Hegel (as the inheritor of the labours of Fichte and Schelling), exhibit the movement outwards to reconquer the universe, proceeding from that principle which Socrates and Kant had emphasised in its fundamental worth.

Mr. Mill, in the closing chapter of his Logic, has briefly sketched the ideal of a science to which he gives the name of Teleology, corresponding in the ethical and practical sphere to a *Philosophia Prima*, or Metaphysics, in the theoretical. This ideal and ultimate court of appeal is to be valid in Morality, and also in Prudence, Policy and Taste. But the conception, although a desirable one, falls short of the work which Hegel assigns to philosophy. What he intended to accomplish with detail and regular evolution was not a system of principles in these departments of action only, but a theory which would give its proper place in our total Idea of reality to Art, Science, and Religion, to all the consciousness of ordinary life, and to the evolution of the physical universe. Philosophy ranges over the — whole field of actuality, or existing fact. Abstract principles are all very well in their way; but they are not philosophy. If the world in its

historical and its present life develops into endless detail in regular lines, philosophy must equally develop the narrowness of its first principles into the plenitude of a System, — into what Hegel calls, the Idea. His point of view may be gathered from the following remarks in a review of Hamann, an erratic friend and fellow-citizen of Kant's.

Hamann would not put himself to the trouble, which in an higher sense God undertook. The ancient philosophers have described God under the image of a round ball. But if that be His nature, God has unfolded it; and in the actual world He has opened the closed shell of truth into a system of Nature, into a State-system, a system of Law and Morality, into the system of the world's History. The shut fist has become an open hand, the fingers of which reach out to lay hold of man's mind, and draw it to Himself. Nor is the human mind a self-involved intelligence, blindly moving within its own secret recesses. It is no mere feeling and groping about in a vacuum, but an intelligent system of rational organisation. Of that system Thought is the summit in point of form: and Thought maybe described as the capability of going beyond the mere surface of God's self-expansion, — or rather as the capability, by means of reflection upon it, of entering into it, and then when the entrance has been secured, of retracing in thought God's expansion of Himself. To take this trouble is the express duty and end of ends set before the thinking mind, ever since God laid aside His rolled-up form, and revealed Himself[1].'

Enthusiastic admirers have often spoken as if the salvation of the time could only come from the Hegelian philosophy. 'Grasp the secret of Hegel,' they say, 'and you will find a cure for the delusions of your own mind, and the remedy which will set right the wrongs of the world.' These high claims to be a panacea were never made by Hegel himself. According to him, as according to Aristotle, philosophy *as such* can produce nothing new. Practical statesmen, and theoretical reformers, may do their best to correct

the inequalities of their time. But the very terms in which Bacon scornfully depreciated one great concept of philosophy are to be accepted in their literal truth. Like a virgin consecrated to God, she bears no fruit[2]. She represents the spirit of the world, resting, as it were, when one step in the progress has been accomplished, and surveying the advance which has been made. Philosophy is not,' says Fichte, 'even a means to *shape* life: for it lies in a totally different world, and what is to have an influence upon life must itself have sprung from life. Philosophy is only a means to the *knowledge* of life.' Nor has it the vocation to edify men, and take the place of religion on the higher levels of intellect. 'The philosopher,' Fichte boldly continues, 'has no God at all and can have no God: he has only a concept of the concept or of the Idea of God. It is only in life that there is God and religion: but the philosopher as such is not the whole complete man, and it is impossible for any one to be *only* a philosopher[3].' Philosophy does not profess to bring into being what ought to be, but is not yet. It sets up no mere ideals, which must wait for some future day in order to be realised. Enough for it if it show what the world *is,* if it were what it professes to be, and what in a way it must be, otherwise it could not be even what it is. The subject-matter of philosophy is that which is always realising and always realised — the world in its wholeness as it is and has been. It seeks to put before us, and embody in permanent outlines, the universal law of spiritual life and growth, and not the local, temporary, and individual acts of human will.

Those who ask philosophy to construe, or to deduce *a priori* a single blade of grass, or a single act of a man, must not be grieved if their request sounds absurd and meets with no answer. The sphere of philosophy is the Universal. We may say, if we like, that it is retrospective. It is the spectator of all time and all existence: it is its duty to view things *sub specie aeternitatis*. To comprehend the universe of thought in all its formations and

all its features, to reduce the solid structures, which mind has created, to fluidity and transparency in the pure medium of thought, to set free the fossilised intelligence which the great magician who wields the destinies of the world has hidden under the mask of Nature, of the Mind of man, of the works of Art, of the institutions of the State and the orders of Society, and of religious forms and creeds: — such is the complicated problem of philosophy. Its special work is to comprehend the world, not try to make it better. If it were the purpose of philosophy to reform and improve the existing state of things, it comes a little too late for such a task. 'As the thought of the world,' says Hegel, 'it makes its first appearance at a time, when the actual fact has consummated its process of formation, and is now fully matured. This is the doctrine set forth by the notion of philosophy; but it is also the teaching of history. It is only when the actual world has reached its full fruition that the ideal rises to confront the reality, and builds up, in the shape of an intellectual realm, that same world grasped in its substantial being. When philosophy paints its grey in grey, some one shape of life has meanwhile grown old: and grey in grey, though it brings it into knowledge, cannot make it young again. The owl of Minerva does not start upon its flight, until the evening twilight has begun to fall[4].'

CHAPTER IV. HEGEL AND THEOLOGY.

Even an incidental glance into Hegel's Logic cannot fail to discover the frequent recurrence of the name of God, and the discussion of matters not generally touched upon, unless in works bearing upon religion. There were two questions which seem to have had a certain fascination for Hegel. One of them, a rather unpromising problem, referred to the distances between the several planets in the solar system, and the law regulating these intervals[1]. The other and more intimate problem turned upon the value of the proofs usually offered in support of the being of God. That God is the supreme certitude of the mind, the basis of all reality and knowledge, is what Hegel no more put in question, than did Descartes, Spinoza, or Locke. What he often repeated was that the *matter* in these proofs must be distinguished from the imperfect *manner* in which the arguers presented it. Again and again in his Logic, as well as in other discussions more especially devoted to it, he examines this problem. His persistence in this direction might earn for him that title of 'Knight of the Holy Ghost,' by which Heine, in one of the delightful poems of his 'Reisebilder,' describes himself to the maid of Klausthal in the Harz. The poet of Love and of Freedom had undoubted rights to rank among the sacred band: but so also had the philosopher. Like the Socrates whom Plato describes to us, he seems to feel that he has been commissioned to reveal the truth of God, and quicken men by an insight into the right wisdom. Nowhere in the modern period of philosophy has higher spirit breathed in the utterances of a thinker. The same theme is claimed as the common heritage of philosophy and religion. A letter to Duboc[2], the father of a modern German novelist, lets us see how important this aspect of his system was to Hegel himself. He

had been asked to give a succinct explanation of his standing-ground: and his answer begins by pointing out that philosophy seeks to apprehend in reasoned knowledge the same truth which the religious mind has in its faith.

Words like these may at first sight suggest the bold soaring of ancient speculation in the times of Plato and Aristotle, or even the theories of the medieval Schoolmen. They sound as if he proposed to do for the modern world, and in the full light of modern knowledge, what the Schoolmen tried to accomplish within the somewhat narrow conceptions of medieval Christianity and Greek logic. Still there is a difference between the two cases. While the Doctors of the Church, in appearance at least, derived the form of exposition, and the matter of their systems, from two independent and apparently heterogeneous sources, the modern Scholastic of Hegel claims to be a harmonious unity, body finding soul, and soul giving itself body. And while the Hegelian system has the all-embracing and encyclopaedic character by which Scholastic science threw its arms around heaven and earth, it has also the untrammeled liberty of the Greek thinkers. Hegel, in short, shows the union of these two modes of speculation: free as the ancient, and comprehensive as the modern. His theory is the explication of God; but of God in the actuality and plenitude of the world, and not as a transcendent Being, such as an over-reverent philosophy has sometimes supposed him, in the solitude of a world beyond.

The greatness of a philosophy is its power of comprehending facts. The most characteristic fact of modern times is Christianity. The general thought and action of the civilised world has been alternately fascinated and repelled, but always influenced, and to a high degree permeated, by the Christian theory of life, and still more by the faithful vision of that life displayed in the Son of Man. To pass that great cloud of witness and leave it on the other side, is to admit that your system is no key to the secret of the world, — even if we add, as some will prefer, of the world as it is and has

been. And therefore the Hegelian system, if it is to be a philosophy at all, must be in this sense Christian. But it is neither a critic, nor an apologist of historical Christianity. The voice of philosophy is as that of the Jewish doctor of the Law: ‘If this council or this work be of men, it will come to nought: but if it be of God, ye cannot overthrow it, Philosophy examines what is, and not what, according to some opinions, ought to be. Such a point of view requires no discussion of the ‘How’ or the ‘Why’ of Christianity. It involves no inquiry into historical documents, or into the belief in miracles: for to it Christianity rests only incidentally on the evidence of history; and miracles, as vulgarly explained, can find no reception in a philosophical system. For it Christianity is ‘absolute religion’: religion i. e. which has fully become and realised all that religion meant to be. That religion has, of course, its historical side: it appeared at a definite epoch in the annals of our race: it revealed itself in a unique personality in a remarkable nation. And at an early period of his life Hegel had tried to gather up in one conception the traits of that august figure, in his life and speech and death. But, in the light of philosophy, this historical side shrivels up as comparatively unimportant. Not the personality, but the ‘revelation of reason’ through man’s spirit: not the annals of a life once spent in serving God and men, but the words of the ‘Eternal Gospel are henceforth the essence of Christianity.

Thus the controlling and central conception of life and actuality, which is the final explanation of all that man thinks and does, has a twofold aspect. There is, as it were, a double Absolute — for under this name philosophy has what in religion corresponds to God. It is true that in the final form of his system the Absolute Spirit has three phases — each as it were passing on into and incorporated with the next — Art working out its implications till it appears as Religion, and Religion calling for its perfection in Philosophy. But in the *Phenomenology*, his first work, the religion of Art only intervenes as a grade from ‘natural’ religion to religion manifest or

revealed; and in the first edition of the *Encyclopaedia* what is subsequently called Art is entitled the Religion of Art. It is in entire accordance with these indications when in the Lectures on Aesthetics[3] it is said ‘the true and original position of Art is to be the first-come immediate self-satisfaction of Absolute Spirit’; though in our days (it is added) ‘its form has ceased to be the highest need of the spirit.’ It is hardly too much then to say that, for Hegel, the Absolute has two phases, Religion and Philosophy.

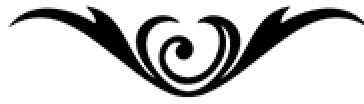
The Hegelian view presents itself most decisively, though perhaps with a little lecture-like over-insistance, in the Philosophy of Religion[4]. ‘The object of religion as of philosophy is the eternal truth in its very objectivity, — God and nothing but God, — and the “explication” of God. Philosophy is not a wisdom of the world, but cognition of the non-worldly: not a cognition of the external mass of empirical existence and life, but cognition of what is eternal, what is God, and what flows from His nature. For this nature must reveal and develop itself. Hence philosophy “explicates” itself only when it “explicates” religion; and in explicating itself it explicates religion.... Thus religion and philosophy coincide: in fact, philosophy is itself a divine service, is a religion: for it is the same renunciation of subjective fancies and opinions, and is engaged with God alone.’

Again, it may be asked in what sense philosophy has to deal with God and with Truth. These two terms are often synonyms in Hegel. All the objects of science, all the terms of thought, all the forms of reality, lead out of themselves, and seek for a centre and resting-point. They are severally inadequate and partial, and they crave adequacy and completeness. They tend to organise themselves; to call out more and more distinctly the fuller reality which they presuppose, — which must have been, otherwise they could not have been: they reduce their first appearance of completeness to its due grade of inadequacy and bring out their complementary side, so as to constitute a system or universe; and in this tendency to a self-correcting

unity consists their progress to truth. Their untruth lies in isolation and pretended independence or finality. This completed unity, in which all things receive their entireness and become adequate, is their Truth: and that Truth, as known in religious language, is God. Rightly or wrongly, God is thus interpreted in the Logic of Hegel.

Such a position must seem very strange to one who is familiar only with the sober studies of English philosophy. In whatever else the leaders of the several schools in this country disagree, they are nearly all at one in banishing God and religion to a world beyond the present sublunary sphere, to an inscrutable region beyond the scope of scientific inquiry, where statements may be made at will, but where we have no power of verifying any statement whatever. This is the common doctrine of Spencer and Mansel, of Hamilton and Mill. Even those English thinkers, who show some anxiety to support what is at present called Theism, generally rest content with vindicating for the mind the vague perception of a Being beyond us, and differing from us incommensurably. God is to them a residual phenomenon, a marginal existence. Outside the realm of experience and knowledge there is not-nothing — a something — beyond definite circumscription: incalculable, and therefore an object, possibly of fear, possibly of hope: the reflection in the utter darkness of a great What-may-it-not-be? He is the Unknown Power, felt by what some of these writers call intuition, and others call experience. They do not however allow to knowledge any capacity of apprehending in detail the truths which belong to the kingdom of God. Now the whole teaching of Hegel is the overthrow of the limits thus set to religious thought. To him all thought, and all actuality when it is grasped by knowledge, is from man's side, an exaltation of the mind towards God: while, when regarded from the divine standing-point, it is the manifestation by God of His own nature in its infinite variety.

It is only when we fix our eyes clearly on these general features in his speculation, that we can understand why *he* places the maturity of ancient philosophy in the time of Plotinus and Proclus. Not that these Neo-Platonists are, as thinkers, of power equal to their master of Athens. But, in the realm of the blind the one-eyed may be king. The later thinkers set their vision more distinctly and persistently on the land that is eternal— 'on the further side of being,' to quote Plato's phrase. It is for the same reason Hegel gives so much attention to the religious or semi-religious theories of Jacob Böhme and of Jacobi, though these men were in many ways so unlike himself.



[1] Hegel's *Leben*, p. 155. It was in his dissertation *de Orbitis Planetarum,* that the notorious contretemps occurred, whereby, whilst the philosopher, leaning to a Pythagorean proportion, hinted — in a line — that it was unnecessary to expect a planet between Mars and Jupiter, astronomers in the same year discovered Ceres, the first-detected of the Planetoids. A good deal has been made out of this trifle; but it has not yet been shown that the corroboration was anything but the *luck* of the other hypothesis.

[2] *Vermischte Schriften*, vol. ii. p. 520. Duboc was a retired hatter, of French origin, who had settled at Hamburg (Hegel's *Briefe*, ii. 76 seqq.).

CHAPTER V. PSEUDO-IDEALISM: JACOBI.

IT IS HAZARDOUS to try to sum up the net result of a philosophy in a few paragraphs. Since Aristotle separated the pure 'energy' of philosophy from the activities which leave works made and deeds done behind them, it need scarcely be repeated that the result of a philosophical system is nothing palpable or tangible, — nothing on which you can put your finger, and say definitely: Here it is. The spirit of a philosophy always refuses to be incarcerated in a formula, however deftly you may try to charm it there. The statement of the principle or tendency of a philosophical system tells not what that system is, but what it is not. It marks off the position from contiguous points of view; and on that account never gets beyond the borderland, which separates that system from something else. The method and process of reasoning is as essential in knowledge, as the result to which it leads: and the method in this case is thoroughly bound up with the subject-matter. A mere analysis of the method, therefore, or a mere record of the purpose and outcome of the system, would be, the one as well as the other, a fruitless labour, and come to nothing but words. Thus any attempt to convey a glimpse of the truth in a few sentences and in large outlines seems foreclosed. The theory of Hegel has an abhorrence of mere generalities, of abstractions with no life in them, and no growth out of them. His principle has to prove and verify itself to be true and adequate: and that verification fills up the whole circle of circles, of which philosophy is said to consist.

It seems as if there were in Hegel two distinct habits of mind which the world — the outside observer — rarely sees except in separation. On one hand there is a sympathy with mystical and intuitional minds, with the

upholders of immediate knowledge and of innate ideas, with those who find that science and demonstration rather tend to distract from the one thing needful — who would ‘lie in Abraham’s bosom all the year,’ — those who would fain lay their grasp upon the whole before they have gone through the drudgery of details. On the other hand, there is within him a strongly ‘rationalising’ and non-visionary intellect, with a practical and realistic bent, and the full scientific spirit. Schelling, in an angry mood, could describe him as ‘the quintessence of all that is prosaic, both outside and in[1].’ Yet, seen from other points of view, Hegel has been accused of dreaminess, pietism, and mystical theology. His merging of the ordinary contrasts of thought in a completer truth, and what would popularly be described as his mixing up of religious with logical questions, and the general unfathomableness of his doctrine, — all seem to support such a charge. Yet all this is not inconsistent with a rough and incisive vigour of understanding, a plainness of reason, and a certain hardness of temperament. This philosopher is in many ways not distinguishable from the ordinary citizen, and there are not unfrequent moments when his wife hears him groan over the providence that condemned him to be a philosopher[2]. He is contemptuous towards all weakly sentimentalism, and almost brutal in his emphasis on the reasonableness of the actual and on the folly of dreaming the might-have-been; and keeps his household accounts as carefully as the average head of a family. And, perhaps, this convergence of two tendencies of thought may be noticed in the gradual maturing of his ideas. In the period of his ‘Lehrjahre,’ or apprenticeship, from 1793 to 1800, we can see the study of religion in the earlier part of that time at Bern succeeded by the study of politics and philosophy at Frankfort-on-the-Main.

His purpose on the whole may be termed an attempt to combine breadth with depth, the intensity of the mystic who craves for union with Truth, with the extended range and explicitness of those who multiply knowledge.

‘The depth of the mind is only so deep as its courage to expand and lose itself in its explication[3]. It must prove its profundity by the ordered fullness of the knowledge which it has realised. The position and the work of Hegel will not be intelligible unless we keep in view both of these antagonistic points.

The purpose of philosophy — as has been pointed out — is, for Hegel — to know God, which is to know things in their Truth — to see all things in God — to comprehend the world in its eternal significance. Supposing the purpose capable of being achieved, what method is open to its attainment? There is on one hand the method of ordinary science in dealing with its objects. These are *things,* found as it were projected into space before the observer, lying outside one another in *prima facie* independence, though connected (by a further finding) with each other by certain ‘accidents’ called qualities and relations. Among the objects of knowledge, there are included, by the somewhat naïve intellect that accepts tradition like a physical fact, certain ‘things’ of a rather peculiar character. One of these is God: the others, which a historical criticism has subjoined, are the Soul and the World. And whatever may be said of the thinghood, reality, or existence of the World, there is no doubt that God and the Soul figure, and figure largely, in the consciousness of the human race as entities, differing probably in many respects from other things, but still possessed of certain fundamental features in common, and thus playing a part as distinct realities amongst other realities.

Given such objects, it is natural for a reflecting mind to attempt to make out a science of God and a science of the Soul, just as of other ‘things.’ And to these, a system-loving philosopher might add a science of the world (Cosmology)[4]. It was felt, indeed, that these objects were peculiar and unique. Thus, for example, as regards God, it was held necessary by the logician who saw tradition in its true light to prove His existence’: and

various arguments to that end were at different times devised. With regard to the human Soul, similarly, it was considered essential to establish its independent reality as a thing really separate from the bodily organism with which its phenomena were obviously connected, — to prove, in short, its substantial existence, and its emancipation from the bodily fate of dissolution and decay. With reference to the World, the problem was rather different: it was felt that the name suggested problems for thought rather than denoted reality. How can we predicate of the whole what is predicable of its parts? This or that may have a beginning and a cause, may have a limit and an end: but can the totality be presented under these aspects, without leading to self-contradiction? And the result of these questions in the case of 'Cosmology' was to shed in the long run similar doubts on 'Rational' Theology and 'Rational' Psychology.

Practically this metaphysical science — which is so called as dealing with a province or provinces of being *beyond* the ordinary or natural *(physical)* realities — treated God and the Soul by the same terms (or *categories*) as it used in dealing with 'material' objects. God e. g. was a force, a cause, a being; so, too, was the Soul. The main butt of Kant's destructive *Criticism of pare Reason* is to challenge the justice of including God and the Soul among the objects of science, — among the things we can know as we may know plants or stars. To make an object of knowledge (in the strict sense), to make a thing, the prerequisite, Kant urges, is perception in space and time. Without a sensation — and that sensation, as it were, laid out in place and duration — an object of science is impossible. No mere demonstration will conjure it into existence. And with that requirement the old theology and psychology, which professed to expound the object-God and the object-soul, were ruled out-of-order in the list of sciences, and reduced to mere dialectical exercises. The circle of the sciences, therefore,

does not lead beyond the conditioned,' beyond the regions of space and time. It has nothing to say of a 'first cause' or of an ultimate end.

Such was the result that might fairly be read from Kant's *Criticism of pare Reason*, — especially if read without its supplementary sequels, and, above all, if read by those in whom feeling was stronger than thought, or who were by nature more endowed with the craving for faith than with the mind of philosophy. Such a personality appeared in J. H. Jacobi, the younger brother of a poet not undistinguished in his day. Amid the duties of public office and the cares of business, he found time to study Spinoza, the English and Scotch moralists, and above all to follow with interest the development of Kant from the year 1763 onwards. His house at Düsseldorf was the scene of many literary reunions, and Jacobi himself maintained familiar intercourse with the leaders of the literary and intellectual world, such as Lessing, Hamann, Goethe. His first considerable works were two novels, in letters, — Allwill, begun in a serial magazine in 1775, and Woldemar, begun in another magazine in 1777; both being issued as complete works in 1781. Both turn on a moral antithesis, and both leave the antithesis as they found it. *Here* pleads the advocate of the heart: 'it is the heart which alone and directly tells man what is good': 'virtue is a fundamental instinct of human nature': the true basis of morals is an immediate certainty; and the supreme standard is an 'ethical genius' which as it were discovered virtue and which still is a paramount authority in those exceptional situations in life when the 'grammar of virtue' fails to supply adequate rules, and where, therefore, the immediate voice of conscience must in a 'licence of sublime poesy[5]' dare, as Burke says, to 'suspend its own rules in favour of its own principles.' *There*, on the other hand, is the champion of reason, who declares all this sentimentalism 'a veritable mysticism of antinomianism and a quietism of immorality[6]': 'To humanity,' he says, 'and to every man (every complete man) principles, and some

system of principles, are indispensable.' Woldemar concludes with the pair of mottoes: 'Whosoever trusts to his own heart is a fool,' and 'Trust love: it takes everything, but it gives everything.'

In 1780 Jacobi had his historic conversation with Lessing at Wolfenbüttel[7]. The talk turned on Spinoza. For many years the philosophy of Spinoza had seemed to vanish from the world. His name was only heard in a reference of obloquy, as if it were dangerous to be even suspected of infection with the taint of Atheism. But both Lessing and Jacobi had found him out. The former saw in him an ally in that struggle for higher light and wider views which he undertook in a spirit and with a scope hardly surmised by those he usually wrought with. Jacobi, on the contrary, saw in him personified the conjunction of all those irreligious tendencies which all philosophy in some degree exhibited: the tendency to veil or set aside God and personality. 'I believe,' says Jacobi, as he began the conversation 'in an intelligent personal cause of the world.' 'Then I am going,' replied Lessing, 'to hear something quite new': and he dryly put aside the other's rhapsody on the 'personal extra-mundane deity with the remark 'Words, my dear Jacobi, words.' Jacobi's work *Letters on the doctrine of Spinoza* (it appeared in 1785) was the beginning of a controversy in which Mendelssohn and Herder took part, and in which Goethe took an interest under Herders tutorship. To the exact philological study of Spinoza it did not contribute much: for the Spinoza whom Herder and Goethe saw as their spiritual forefather was transfigured in their thought to a figure to which Leibniz had almost an equal right to give his name. He upheld to them the symbol of the immanence of the divine in nature: he was the leader in the battle against 'philistine' deism and utilitarianism.

With the Kantian criticism of the pseudo-science of theology Jacobi had in one way no fault to find. That reasoning by its demonstration cannot find out God, was to him an axiomatic belief. But the 'man of feeling' felt

uneasy at the trenchant methods of the Königsberg man of logic. He seemed to see the world of men and things passing under Kant's manipulation into a mere collection of phenomena and ideas of the mind. Still more was he sensible to the loss of his God. That surrogate of an argument for theism which Kant seemed to offer in the implications of the Moral Law did not give what Jacobi wanted. Mere morality is a cold and mechanical principle — he thinks — compared with that infinite life and love which we deem we have in God. The son of man, he felt, was, in virtue of an indwelling genius of conscience, supreme over the moral law: how much more, then, the Absolute and Eternal on a higher grade of being than its mechanical regularities!

If the way of reasoning will not carry us to the Absolute, still less (and that is whither Jacobi wishes to reach) to God, there must be another way: for something in him, which may be called Faith or Feeling, Spiritual Sense or Reason, proclaims itself certain of the reality both of God and Nature. There *is* an objective reality — outside and beyond him — yet somehow to be reached by a daring leap, — whereby, out of sheer force of will, he, shutting his eyes to the temporal and the mechanical, finds himself carried over the dividing gulf into the land of eternal life and love.

'I appeal' he says in his latest utterances[8] 'to an imperative, an invincible feeling as the first and underived ground of all philosophy and all religion, — to a feeling which lets man become aware of and alive to the fact that he has a sense for the supersensuous.' 'As it is religion which makes man man,' he continues, 'and which alone lifts him above the animals, so it also makes him a philosopher.' Such an organ for the supersensuous is what in his later writings he calls *Vernunft* (Reason) and distinguishes from *Verstand* (Understanding). 'This reason,' says Coleridge (to whom we owe this use of the terms in English) in the *Friend,* 'is an organ bearing the same relation to spiritual objects as the eye bears to material phenomena,' It is

‘that intuition of things which arises when we possess ourselves as one with the whole and is opposed to that ‘science of the mere understanding’ in which ‘transferring reality to the negations of reality (to the ever-varying framework of the uniform life) we think of ourselves as separated beings, and place nature in antithesis to the mind, as object to subject, thing to thought, death to life.’ But this Reason is even more than this. It is the direct contact with reality, which it affirms and even *is.* It apprehends the *me* and the *thee,* it apprehends above all the great *Thee,* God: apprehends, and we may even say appropriates[9]. And it apprehends them at one bound — in one *salto mortale* — because it is really in implicit possession of them. Call the step a miracle, if you will: you must admit, he adds, that ‘some time or other every philosophy must have recourse to a miracle[10].’

And yet the asseveration rings false — it shows a womanish wilfulness and weakness in its reiteration. He has the reality; yet he has it not. ‘Were a God known,’ he says in one place, ‘He would not be God.’ He yearns with passionate longing to find the living and true: he feels himself and the Eternal clasped in one: his faith effects the reality of things hoped for. But, he adds, ‘We never see the Absolute’: the primal light of reason is but faint. It is but a presage — a pre-supposition — of the Everlasting. This reason, in short, needs discipline and development, it needs the ethical life to raise it: ‘without morality no religiosity,’ he says. ‘Light,’ he complains, ’is in my heart,’ but at the moment I want to bring it into the understanding, the light goes out.’ And yet he knows — and Coleridge repeats— ‘the consciousness of reason and of its revelations is only possible in an understanding.’

‘There seem to be one or two motives acting upon Jacobi. The ‘plain man,’ especially if he be of high character and of ‘noble’ religiosity, has a feeling that the lust of philosophising disturbs the security of life, and endangers things which are deservedly dear to him. In such an one the ‘enthusiasm of logic’ — the calm pursuit of truth at all costs, so

characteristic of Lessing — is inferior to the 'enthusiasm of life,' — a passion in which the terrestrial and the celestial are inextricably blended, where one clings to God as the stronghold of self, and sets personality — our human personality — in the throne of the Eternal. He will be all that is noble and good, if only he be not asked utterly to surrender self. So, too, Jacobi's God — or Absolute (for he leaves his 'non-philosophy' so far as to use both names), is rather the final aim of a grand, overpowering yearning, than a calm, self-centred, self-expanding life which carries man along with it. It would be, he feels, so very terrible, if at the last there were no God to meet us — to find the throne of the universe vacant. Avaunt philosophy, therefore! Let us cling to the faith of our nature and our childhood, and refuse her treacherous consolations! With the central proposition of Jacobi, Hegel, for one, is not inclined to quarrel. He too, as he asks and answers the question as to the issues of this and of the better life, might say

'Question, answer presuppose
Two points: that the thing itself which questions, answers, — *is,* it
knows;
As it also knows the thing perceived outside itself — a force
Actual ere its own beginning, operative through its course,
Unaffected by its end, — that this thing likewise needs must be;
Call this — God, then, call that — Soul, and both the only facts for me.
Prove them facts? that they o'erpass my power of proving proves
them such:
Fact it is, I know, I know not something which is fact as much.'

But when Jacobi goes on to say that it is the supreme and final duty of the true sage 'to unveil reality,' — meaning thereby that, given the feeling, he has only to

‘Define it well
For fear divine Philosophy
Should push beyond her mark and be
Procuress to the Lords of Hell,’

Hegel withdraws. It is the duty of philosophy to labour to make the perception — the fleeting, uncertain, trembling perception — of faith, a clear, sure, inwardly consistent knowledge: to show, and not merely to assert, that ‘the path of (this world’s) duty is the way to (that world’s) glory.’ There is, Hegel himself has said more than once, something opposed to ordinary ways of thinking in the procedure of the philosopher. To the outsider, it seems like standing on your head. It involves something like what, in religious language, is termed conversion — a new birth — becoming a new man. But though such a change always seems to culminate in a moment of sudden transformation, — as if the continuity of old and new were disrupted, the process has a history and a preparation. Of that pilgrim’s progress of the world-distracted soul to its discovery of its true being in God, philosophy is the record: a record which Hegel has written both in the *Phenomenology of Mind*, and, more methodically, in his *Encyclopaedia.* The passage from nature to God — or from man’s limitations to the divine fullness — must be made, he urged, in the open day and not in the secret vision when sleep falls upon men. When the aged Jacobi read these requirements of Hegel, he wrote to a friend: ‘He may be right, and I should like once again to experiment with him all that the power of thinking can do alone, were not the old man’s head too weak for it[11].’

‘For a philosophy like this,’ says Hegel[12], ‘individual man and humanity are the ultimate standpoint: — as a fixed invincible finitude of reason, not as a reflection of the eternal beauty, or as a spiritual focus of the universe, but as an ultimate sense-nature, which however with the power of faith can daub itself over here and there with an alien supersensible. Let us suppose

an artist restricted to portrait-painting; he might so far idealise as to introduce in the eye of a commonplace countenance a yearning look, and on its lips a melancholy smile, but he would be utterly debarred from depicting the Gods, sublime over yearning and melancholy — as if the delineation of eternal pictures were only possible at the cost of humanity. So too Philosophy — on this view — must not portray the Idea of man, but the abstraction of a humanity empirical and mingled with short-comings, and must bear a body impaled on the stake of the absolute antithesis; and when it clearly feels its limitation to the sensible, it must at the same time bedeck itself with the surface colour of a supersensible, and point the finger of faith to a something Higher.

‘But the truth cannot be defrauded by such a consecration if finitude be still left subsisting; the true consecration must annihilate it. The artist, who fails to give actuality the true truth by letting fall upon it the ethereal illumination and taking it completely in that light, and who can only depict actuality in its bare ordinary reality and truth (a reality however which is neither true nor real) may apply the pathetic remedy to actuality, the remedy of tenderness and sentimentality, everywhere putting tears on the cheeks of the commonplace, and an O God! in their mouth. No doubt his figures in this way direct their look over the actual heavenwards, but like bats they belong neither to the race of birds nor beasts, neither to earth nor heaven. Their beauty is not free from ugliness, nor their morals without weakness and meanness: the intelligence they haply may show is not without banality: the success which enters into it is not without vulgarity, and the misfortune not without cowardice and terror; and both success and misfortune have something contemptible. So too philosophy, if it takes the finite and subjectivity as absolute truth in the logical form habitual to her, cannot purify them by bringing them into relation with an infinite: for that infinite is not itself the true, because it is unable to consume finitude. But where a

philosophy consumes the temporal as such and burns up reality, its action is pronounced a cruel dissection, which does not leave man complete, and a forcible abstraction which has no truth, above all no truth for life. And such an abstraction is treated as a painful amputation of an essential piece from the completeness of the whole: that essential piece, and absolute substantiality being believed to consist in the temporal and empirical, and in privation. It is as if a person, who sees only the feet of a work of art, were to complain, should the whole work be unveiled to his eyes, that he was deprived of the privation, that the incomplete was decompleted.'

Jacobi has been spoken of as the leader of this 'Un-philosophy' of faith. As such his allies lie on one side among philosophers who hold by the deliverances of 'common sense,' by the consciousness of the unsophisticated man shrinking from the waywardness of an idealism that deprives him of his solidest realities. The type of such a philosopher has been drawn by Hegel[13] in Krug. But, on the other side, Jacobi touched hands — though not in a sympathetic spirit — with a somewhat motley band which also had set its face to go to the everlasting gates, but had turned aside to aimless wandering on the Hill Difficulty, or sought too soon the repose of the Delectable Mountains, without due sojourn in the valley of Humiliation or descent under the Shadow of Death. Like Wordsworth, they felt that the world is too much with us: that our true self is frittered away into fragments and passing stages, in which we are not ourselves, — whereby we also lose the true perception of the essential life of nature. Gradually we have sunk into the deadening arms of habit, reduced ourselves to professional and conventional types, and lost the freer and larger mobility of spiritual being. We have grown into *verständige Leute* — people of practical sense and worldly wisdom. To such, philosophy would come — if it could come — as the great breath of life — of 'reason' (*Vernunft*) which transcends the separations inevitable in practical will and knowledge. But to
